FRONTISPIECE.

*O native Isle! fair Freedom's happiest Seat,
At thought of thee my bounding Pulses beat:*

I

*At thought of thee my Heart impatient burns,
And all my Country on my Soul returns. Lord Littleton.*

ENGLAND DISPLAYED.

B E I N G

A New, Complete, and Accurate Survey and Description
O F T H E
K I N G D O M of E N G L A N D,
A N D
P R I N C I P A L I T Y of W A L E S.

C O N T A I N I N G,

I. A full and ample Account of whatever is remarkable in every COUNTY, CITY, *Town, Village, Hamlet,* and Parish in ENGLAND and WALES.

II. Description of the various Manufactures and other useful Arts established in different Parts of this Kingdom.

III. Accounts of the Nature and Produce of the various Kinds of Land, with a complete History of the modern Improvements in Agriculture, Gardening, &c.

IV. An historical Account of all the Forts, Castles, Roman Military Ways, Docks, Harbours, Creeks, Bays, &c. with the Particulars of their ancient and present State.

V. A full Description of all the natural and artificial Curiosities of this Kingdom; such as Rocks, Mines, Caverns, Lakes, Grottos, Fossils, Minerals, Abbeys, Cathedrals, Churches, Palaces, and the Seats of the Nobility and Gentry.

VI. A faithful Narrative of all Improvements made in the Roads, Rivers, and Canals of this Kingdom, for the Convenience of Travelling, and the Benefit of Inland Navigation.

The whole forming such an accurate and comprehensive Account of this Country, as has never yet been published, and will be equally entertaining and instructive.

By a SOCIETY of GENTLEMEN:

Each of whom has undertaken that Part for which his Study and Inclination has more immediately qualified him;

The Particulars respecting ENGLAND, revised, corrected, and improved,

By P. R U S S E L L, Esq;

And those relating to WALES,

By Mr. O W E N P R I C E.

Historia vero testis temporum, lux veritatis, vita memoriae, magistra vite.

Cic. de Orat. Lib. ii. § 9.

V O L. I.

By the King's Authority.

L O N D O N:

Printed for the AUTHORS, by ADLARD and BROWNE, Fleet-Street:

And sold by S. BLADON, No. 28, T. EVANS, No. 54, and J. COOTE, No. 16, in Pater-noster Row;

A D V E R T I S E M E N T.

THERE is perhaps no country in the world that better deserves to be known, than the kingdom of England; it has long been famous for mines, medicinal waters, antiquities, manufactures, commerce and fertility. The works of nature and art are here displayed in the utmost profusion, while the traces of the busy hand of improvement, guided by genius, and supported by industry, are visible in every corner of this flourishing Island.

And yet all the descriptions hitherto published are very defective, and the modern improvements almost totally disregarded. Indeed the far greater part of these improvements have been made since the principal books of this kind were published; and succeeding writers have been little better than copiers of the imperfect accounts and errors of their predecessors.

But it is not our intention to point out here the faults of former writers: they are already sufficiently conspicuous, and will serve as beacons for us to avoid the rocks on which they have miscarried.

The Authors of this Work, animated by the most laudable curiosity, and impressed with the warmest attachment to their native country, have made the knowledge of its internal advantages their peculiar study, and some of them have travelled to its remotest borders, to gratify the passion so laudably inspired.

Having completed their agreeable tour, they have carefully digested their materials, and now cheerfully submit them to the public eye, fearing no censure, as they have sincerely laboured to deserve none, and courting no applause but what their labours may be thought to merit.

There is indeed one particular, in which all the accounts of this island hitherto published are deficient from necessity; a want of perspective views and other plates absolutely necessary to elucidate all performances of this kind, if the authors are desirous of conveying adequate ideas to their readers.

This defect we have been very careful to supply, by giving more than thrice the number of copper-plates, exclusive of maps, to be found in any work of this kind yet extant. And on those copper-plates, which are most elegantly engraved, we have taken care to represent the most curious objects, whether formed by the hand of nature or art.

Entertainment and instruction are the principal ends of this performance; we will therefore endeavour to give the reader all the satisfaction in our power, with regard to every object that merits attention. We will lead him from one place to another, and point out the various particulars for which each is remarkable: display their government, their customs, and their privileges: we will describe the various structures, whether erected by ancient or modern artists; together with the statues, paintings, and curiosities, natural or artificial, with which many of them are decorated; we will trace the courses of the rivers which water this island, and describe the different canals, and other works of art intended to increase the benefit of inland navigation.

The trade and manufactures of each county will be fully considered; and the various improvements lately made in many of the mechanical arts particularly enumerated.

Agriculture, and every other branch of husbandry, certainly demand a particular attention. The authors have therefore traced the various improvements by which the value of lands have been of late so considerably augmented, in order to disseminate this useful knowledge over all parts of the kingdom, that every county may equally reap the advantages of these important discoveries, many of which have been long confined to the small districts where they were originally made.

If the natural history of foreign countries be thought worthy our attention, certainly that of our own deserves to be particularly regarded by the inhabitants of these kingdoms. It is indeed chiefly from the natural history that we collect the value and importance of any kingdom; because from thence we learn

its produce of every kind. The greatest care therefore will be taken to display the riches we derive from the animal, vegetable, and mineral kingdoms; to describe their respective properties, together with the methods of using, improving, and manufacturing them for the various purposes of life.

Nor will the remains of antiquity be forgotten. The authors will point out the ruins of ancient structures, and often give a concise history of their building and destruction. An affecting scene! but pregnant with lessons of instruction. It should teach us to value the civil and religious liberties we now enjoy in this happy island; and stimulate us to transmit these invaluable blessings undiminished to posterity. For it should be remembered, that it was the iron hand of tyranny, and the insatiable sword of religious bigotry, that reduced many of those famous structures to heaps of rubbish, and laid the splendor of their inhabitants in the dust.

In considering such a variety of subjects, some errors and mistakes will inevitably be committed: the authors will do all in their power to avoid them; and will think themselves highly obliged to every ingenious gentleman, who will favour them with any accounts of places, either wholly omitted, or imperfectly described by preceding writers; or of any improvement lately made in agriculture, manufactures, and other curious and useful arts. For as it is intended to render this work as complete as possible; and in order to which, neither pains nor expence will be spared; so it is hoped that those gentlemen, who would wish to see the natural and artificial riches of their native country properly displayed, will lend their generous assistance to complete so useful a design.

N. B. The PREFACE, INTRODUCTION, &c. will be delivered at the Conclusion of the WORK.

GEORGE R.

GEORGE the Third, by the Grace of God, King of Great Britain, France, and Ireland, Defender of the Faith, &c. To all to whom these Presents shall come, Greeting. Whereas P. Russell, Esq; Owen Price, Gentleman, and J. Coote, Bookseller, have, by their Petition, humbly represented unto us, That P. Russell, and Owen Price, have been at great Labour and Expence, and have engaged several other Gentlemen not only to make an actual Survey, but also to collect and digest the various Materials, already extant, to perfect the following Work, entitled, "ENGLAND DISPLAYED, or a Complete Survey and Description of Our Kingdom of England and Principality of Wales." That they have also engaged several ingenious Artists to take perspective Views, &c. on the Spot, in order to decorate and illustrate the said Work, &c. We being willing to give all due Encouragement to this Undertaking, are graciously pleased to condescend to the Petitioners Request. And we do therefore, by these Presents, grant unto them the said P. Russell, Owen Price, and J. Coote, their Executors, Administrators, and Assigns, Our Licence for the sole printing and publishing of the said Work, for the Term of Fourteen Years, to be computed from the Date hereof, strictly forbidding all Our Subjects, within Our Kingdoms or Dominions to reprint or abridge the same, either in the like or any Size or Manner whatsoever, or to import, buy, vend, utter, or distribute, any Copies thereof, reprinted, beyond the Seas, during the aforesaid Term of Fourteen Years, without the Consent or Approbation of the said P. Russell, Owen Price, and J. Coote, their Executors, Administrators, and Assigns, under their Hands and Seals first had and obtained, as they will answer the contrary at their Peril.

Given at our Court at St. James's, the 28th Day of February, 1769, in the Ninth Year of our Reign.

By his Majesty's Command,

ROCHFORD.

INTRODUCTORY PREFACE.

ENGLAND is an island in the western ocean, situated between the parallels of fifty and fifty-six degrees north latitude, and between two degrees east, and six degrees west-longitude. It is bounded on the north by that part of the island called Scotland; on the east by the German ocean; on the west by St. George's channel, and on the south by the English channel, which separates it from France.

The etymology of the word England, has caused a great variety of conjectures among the antiquaries; some are of opinion that it is derived from a Celtic word, which signifies a level country. Others suppose it to have been originally written Angleland, the land of the Angles, a people who came into England with the Saxons, and are thought to have given this name to the country, when after invading and reducing it, they united the kingdoms into which it was at first divided, into one monarchy.

The principality of Wales, considered as distinct from England, is formed from a Saxon word, signifying, "A land of strangers:" A name the Saxons thought proper to bestow on that part of the country to which the native inhabitants were driven by their violence, and where they supported themselves against the utmost efforts of their power.

The situation of England, by the sea washing three of its sides, renders it obnoxious to a great uncertainty of weather; and hence the inhabitants of the low lands on the sea-coast are often visited by agues and fevers. But, on the other hand, it prevents the extremes of heat and cold, to which other places lying in the same degrees of latitude and longitude are subject; and hence it becomes extremely friendly to the health and longevity of the inhabitants in general especially to those who reside on a dry soil. Nor is this all the advantages it enjoys from its situation: it is to this particular we ought to ascribe that perpetual verdure for which England is at once admired and envied by all the world; and which is occasioned by the frequent refreshing showers, and the warm vapours from the sea.

About forty-five years before the Christian æra, Britain was invaded by the Romans, under Julius Cæsar, and at length became a province to the Roman empire. The Romans maintained their conquest by a military force, with which they gradually incorporated the flower of the British youth. This force was divided into different parties, which were placed at convenient stations all over the province; and the Roman general, for the time being, was supreme governor of the country.

VOL. I.

Such was the state of Britain, till about the year 426, when the interruption of the northern Barbarians into the Roman empire, made it necessary to recall the troops that were in Britain; upon which the emperor Honorius renounced his sovereignty of the island, and released the Britons from their allegiance.

When the Romans abandoned Britain, with the legions, in which all the natives whom they trusted with military knowledge were incorporated, the country being left in a feeble and defenceless state, was invaded by the Scots. The Scots were so rapacious and cruel, that the South Britons invited over the Saxons to deliver them from intolerable oppression, and drive back the invaders to their own territory, proposing to give them as a reward, the little isle of Thanet, which is divided by a small canal from the coast of Kent.

The Saxons came over with a great number of Angles, a people who are supposed to have derived their name from a place in Denmark; and having driven the Scots out of the country they had subdued themselves; and drove the natives into that part of South Britain now called Wales.

The Saxon generals became petty sovereigns of different districts, and were perpetually committing hostilities against each other, till about the year 823, when a king of the West Saxons, whose name was Egbert, became the sovereign of all England.

About the year 1011, the Danes, who had often invaded the island, and long maintained their ground in a considerable part of it, became lords of all England, under Canutus, their chief, who was crowned king of England: but in the space of twenty years, the sovereignty was recovered by Edward, surnamed the Confessor, a prince of the Saxon line.

About the year 1066, England was again invaded and subdued by William, duke of Normandy, called the Conqueror, in whose successors, though not in a linial descent, the crown has continued ever since.

Britain some time before the Roman invasion, while it was yet under the dominion of its native inhabitants, was divided into seventeen principalities, each of which was governed by a separate and independant chief.

The names of the inhabitants of these principalities, as recorded by the Romans, were 1. Cantuarii. 2. Regni. 3. Durotriges. 4. Dunmonii. 5. Belgæ. 6. Atrebatii. 7. Dobuni. 8. Catteuchlani. 9. Trinobantes. 10. Iceni. 11. Coritani. 12. Cornavii. 13. Brigantes. 14. Ottadini. 15. Silures. 16. Ordovices. 17. Dimetæ.

A

Soon

Soon after Britain was subdued by the Romans, they divided it into five parts: the first, which they called Britannia Prima, contained all the southern tract, bounded on one side by the British ocean, and on the other by the Thames and the Severn Sea. The second, called Britannia Secunda, was the same with that which is now called Wales; the third, Flavia Cæsariensis, reached from the Thames to the Humber; the fourth, Maxima Cæsariensis, from the river Humber to Severus's Wall, or the river Tine; and the fifth, Valentia, from the Tine to the wall near Edinburgh, called by the Scots, Gramefdike.

When the island fell into the hands of the Saxons, it was divided a third time: part of the territory, which the Romans divided into five parts, the Saxons divided into seven, each of which was called a kingdom, and distinguished by the names of Kent, Southsex, East-Angle, Westsex, Northumberland, Eastsex, and Mercia.

The Roman province, which was not included in this division, was Britannia Secunda, a mountainous territory, in which the ancient Britons defended themselves against all the efforts of their enemies.

This Heptarchy was subdivided into several portions, each containing a certain number of hides, a hide being supposed to be as much ground as one plough could till in one year, and each of these districts was under the government of an earlderman, or earl.

About the year 896, Alfred, successor to Egbert, as sovereign of the whole Heptarchy, rendered the commensuration of these districts more exact, and divided England into thirty-two counties, or shires, the present names of which, and their relation, both to the British principalities and the Saxon Heptarchy, will appear by the following table:

Kingdoms of the Saxon Heptarchy.	Counties into which England was divided by Alfred.	Principalities of the ancient Britons.	
The kingdom of Kent.	1. Kent	The British principality inhabited by the Cantii.	
The kingdom of the South Saxons.	2. Suffex	Inhabited by the Regni.	
	3. Surry		
	4. Berkshire		
The kingdom of the West Saxons.	5. Hampshire	The Belgæ:	
	6. Wiltshire.		
	7. Somersetshire		
	8. Dorsetshire		
	9. Devonshire		The Durotriges: Including the district afterwards called Cornwall, the Dunmonii.
The kingdom of Northumberland, which also included, besides Durham and Lancashire, Cumberland, Westmoreland, Northumberland and Scotland, to the Frith of Edinburgh.	10. Yorkshire	Including Durham and Lancashire, the Bregantes, who also inhabited Westmoreland and Cumberland.	
The kingdom of the East Saxons, which also included part of Hertfordshire.	11. Hertfordshire	The Trinobantes.	
	12. Essex		
	13. Middlesex		
The kingdom of the East Angles.	14. Norfolk	The Iceni.	
	15. Suffolk		
	16. Cambridge with Ely		
	17. Huntingdonshire		
The kingdom of Mercia, which included also the other part of Hertfordshire.	18. Derbyshire	The Coritani.	
	19. Nottinghamshire		
	20. Leicestershire		
	21. Lincolnshire		
	22. Northamptonshire, including Rutlandshire		
	23. Warwickshire		The Cattieuchlani:
	24. Bedfordshire		
	25. Buckinghamshire		
	26. Gloucestershire		The Dobani.
	27. Oxfordshire		
28. Herefordshire	The Silures who also inhabited Radnorshire, Brecknockshire, Monmouthshire, and Glamorganshire, in Wales.		
29. Worcestershire	The Cornavii.		
30. Cheshire			
31. Shropshire			
32. Staffordshire			

The three principalities, not included in this division, were those of the Otadini, the Ordovices, and the Dimetæ: the Ottadini inhabited Northumberland, with four counties in Scotland. The Ordovices, Montgomeryshire, Me-

tionethshire, Caernarvonshire, Flintshire, and Denbighshire; and the Dimetæ, Caermarthenshire, Pembrokehire, and Cardiganshire.

These thirty-two counties were increased to forty, by the addition of those afterwards distinguished

tinguished by the names of Dutham and Lancashire, which are supposed to have been then included in Yorkshire; Cornwall included in Devonshire, and Rutlandshire in Northamptonshire; Monmouthshire, which was deemed part of Wales; and Northumberland, Westmoreland, and Cumberland, which are supposed to have been subject to the Scots. These forty, with addition of twelve, into which Wales was

afterwards divided, made the present number fifty-two.

Since the Norman conquest, England has been divided into counties, a certain number of which, excepting Middlesex and Cheshire, are comprehended in six circuits, or annual progresses of the judges for administering justice to the subjects who are at a distance from the capital. These circuits are:

Circuits.	Counties.	Chief Towns.
1. Home Circuit	Essex	Chelmsford, Colchester, and Harwich.
	Hertford	Hertford, St. Alban's, Royston, Ware, Hitchin, and Baldock.
	Kent	Maidstone, Canterbury, Chatham, Rochester, Greenwich, Woolwich, Dover, Deal, and Deptford.
	Surry	Southwark, Kingston, Guildford, Croydon, Epsom, and Richmond.
	Suffex	Chichester, Lewes, Rye, East-Grimstead, and Hastings.
2. Norfolk Circuit	Bucks	Aylesbury, Buckingham, High Wickham, and Marlow.
	Bedford	Bedford, Ampthill, Woburn, Dunstable, Luton, and Biggleswade.
	Huntingdon	Huntingdon, St. Ives, and Kimbelton.
	Cambridge	Cambridge, Ely, Newmarket, and Royston.
	Suffok	Bury, Ipswich, Sudbury, Leostaff, and part of Newmarket.
	Norfolk	Norwich, Thetford, Lynn, and Yarmouth.
3. Oxford Circuit	Oxon	Oxford, Banbury, Burford, Henly, and Bicester.
	Berks	Dorchester, and Wokingham.
	Gloucester	Abingdon, Windsor, Wallingford, Newbury, Hungerford, and Maidenhead.
	Worcester	Gloucester, Tewksbury, Cirencester, and part of Bristol.
	Monmouth	Worcester, Eveham, and Droitwich.
	Hereford	Monmouth and Chepstow.
	Salop	Hereford and Leinster.
	Stafford	Shrewsbury, Ludlow, Bridgnorth, and Wenlock.
4. Midland Circuit	Warwick	Stafford, Litchfield, and Newcastle-under-line.
	Leicester	Warwick, Coventry, Birmingham, and Stratford upon Avon.
	Derby	Leicester, Melton-Mowbray, and Ashby de la Zouch.
	Nottingham	Derby and Chesterfield.
	Lincoln	Nottingham, Southwell, and Newark.
	Rutland	Lincoln, Stamford, Boston, and Grantham.
	Northampton	Oakham and Uppingham.
5. Western Circuit	Hants	Northampton, Peterborough, and Daventry.
	Wilts	Winchester, Southampton, Portsmouth, Andover, Basingstoke, Christchurch, and Newport in the Isle of Wight.
	Dorset	Salisbury, Devizes, Marlborough, Malmesbury, Wilton, and Chippenham.
	Somerfet	Dorchester, Lyme, Sherborn, Shaftesbury, Pool, Blandford, and Bournemouth.
	Devon	Bath, Wells, Bristol in part, Taunton, Bridgwater, and Ilchester.
	Cornwal	Exeter, Plymouth, Barnstaple, Siddeford, Tiverton, Dartmouth, Tavistock, Topsham, and Oakhampton.

P R E F A C E.

Circuits.	Counties.	Chief towns.
6. Northern Circuit	York	York, Leeds, Wakefield, Halifax, Rippon, Pontefract, Hull, Richmond, Scarborough, Boroughbridge, Malton, Sheffield, Doncaster, Whitby, Beverly, Northallerton, and Burlington, or Bridlington.
	Durham	Durham, Stockton, Sunderland, Stanhope, Barnard-Castle, and Auckland.
	Northumberland	Newcastle, Berwick, Tinmouth, Shields, and Hexham.
	Lancaster	Lancaster, Manchester, Preston, Liverpool, and Wigan.
	Westmoreland Cumberland	Appleby, Kendal, and Lonsdale. Carlisle, Penrith, Cockermouth, and Whitehaven.

Middlesex is not comprehended; and Cheshire is left out of these circuits, because, being a county palatine, it enjoys municipal laws and privileges. The same may be said of Wales, which is divided into four circuits.

	Counties.	Chief towns.
Counties exclusive of the Circuits. North-east Circuit	Middlesex	London, first meridian, north latitude 51. 30. Westminster, Uxbridge, Brentford, Barnet, Highgate, Hampstead, Kenfington, Hackney, and Hampton-Court.
	Chester	Chester, Nantwich, Maëclesfield, and Malpas.

C I R C U I T S O F W A L E S.

North-east Circuit	Flint	Flint St. Afaph, and Holywell.
	Denbigh	Denbigh, Wrexham, and Ruthyn;
	Montgomery	Montgomery and Llenvylin.
North-west Circuit	Anglesey	Beaumaris, Llanrickmead, and Holyhead.
	Carnarvon	Bangor, Conway and Pullily.
South-east Circuit	Merioneth	Delgelhen, Bala and Harley.
	Radnor	Radnor and Prestean.
	Brecon	Brecknock.
South-west Circuit	Glamorgan	Llandaff and Cardiff.
	Pembroke	St. David's, Haverfordwest, Pembroke, Denbigh, and Milford-haven;
	Cardigan	Cardigan, and Aberistwith.
	Caermarthen	Caermarthen, and Kidwelly.

I N E N G L A N D.

40 Counties, which send up to parliament	80 Knights.
25 Cities, Ely none, London four	50 Citizens.
167 Boroughs, two each	334 Burgesles.
5 Boroughs, viz. Abingdon, Banbury, Bewdley, Highham Ferrars, and Monmouth, one each	5 Burgesles.
2 Universities	4 Representatives.
Cinque ports; Hastings, Dover, Sandwich, Romney, Hythe, and their three dependants, Rye, Winchester and Seaford, two each	16 Barons.

W A L E S.

12 Counties	12 Knights.
12 Boroughs, Pembroke two, Merioneth none, one each	12 Burgesles.

S C O T L A N D.

Shires	30 Knights.
Boroughs	15 Burgesles.

Total 558.

England Displayed.

C O R N W A L L.

HE county of Cornwall forms the western extremity of England, being bounded on the south, the west and the north, by the sea; and by the river Tamar, which separates it from Devonshire on the west. It is about seventy-eight miles in length from east to west. Its greatest breadth, viz. from the northern point of Morwinstow to

Ramhead, is forty-three miles and a quarter. But from hence the land continually grows narrower towards the west, so that near the western extremity, it is only five miles broad from Mount's bay on the south, to St. Ives' bay on the north. It is divided into nine hundreds, in which are twenty-one parliamentary boroughs, twenty-seven market towns, eighty-nine vicarages, one hundred and sixty-one parish churches, exclusive of chapels of ease, and between twelve and thirteen hundred villages. According to the most accurate computation, it is one hundred and fifty miles in circumference, and contains nine hundred and sixty thousand acres. But according to a survey made in the reign of Edward I. it contained at that time one million five hundred thousand acres; a sufficient proof that large tracts of this county have been swallowed up by the ocean. Perhaps the islands of Scilly were once joined to the western extremity of Cornwall, though since separated from it by the sea.

R I V E R S.

The principal rivers in this county are the Tamar and the Camel. The Tamar rises, in the northern part of the county, about three miles from the sea, issuing from the summit of a moor. From whence the ground, declining to the north, part of the water flows in that direction, and forms the river Turridge, which is navigable a little above the town of Bideford; while the other part of the water descending to the south, forms the beginning of the Tamar. At the distance of ten miles from its source, it becomes a considerable river, and gives name to the small parish and village of North Tamerton, where a stone bridge is built over its stream. It receives, in its course, several small streams, particularly the Atery, so that at Polstun bridge it is considerable, both on account of its width, and the rapidity of its

current. As it continues its course, the river is increased by additional streams. At Stoke-lymsland, not far south of Grey-stone, it passes under a strong stone bridge called Horse-bridge. The last bridge on this river is in the parish of Calstok, to which the tide nearly reached in the time of Henry VIII. though it was navigable no further than Morleham, about two miles below Calstok bridge, and small barks still come up to Morleham. Five miles lower the Tamar receives the Tavy on the east, and becomes a spacious harbour; and passing within half a mile of the ancient borough of Saltash, is joined by the Lynher creek and river. Then passing straight forward, forms the noble harbour of Hamoze; and after a course of forty miles from its source, falls into the sea at Mount Edgumbe.

The Camel rises about two miles north of the borough of Camelford, where its banks are famous for two considerable battles. In the first the famous king Arthur received his mortal wound, from the hand of his nephew. The other was a bloody battle fought between the Cornish and the West Saxons of Devonshire, in the year 824, in which many thousands fell on each side, and the victory at last remained uncertain.

After running about twelve miles, the Camel becomes navigable for barges. At Eglosheh it receives a plentiful addition to its stream, from the Laine. A mile further down, this river flows under the largest bridge in Cornwall, called Wade-bridge. About the year 1460, there was a ferry here when the tide was in, and a very dangerous ford when the tide was retired. To remove this inconvenience, Mr. Lovebon, at that time vicar of Eglosheh, undertook to erect this bridge; a very useful but tedious work; for besides the expence so disproportioned to his circumstances, such difficulties occurred as might have baffled the skill of more able mechanics. The ground for the foundation of some of the piers proved so swampy, that after repeated efforts, they were at last obliged to build on woolpacks. But by his own perseverance, and the liberal contributions of others, he lived to finish the work he had undertaken. It consists of seventeen large and uniform arches, extending quite across the valley. Small barks from forty to sixty tons burden, come up to this bridge, and supply the adjacent country with coals, lime, timber, grocery, &c.

About three miles below this bridge, the Camel reaches the ancient town of Padstow, where there is a pier, and a considerable

siderable trade carried on with Ireland, Wales, and Bristol. About a mile below the town of Padstow, the sea has thrown a bar of sand across the haven, by which ships of more than two hundred tons are prevented from coming in at all; and renders it even dangerous for smaller vessels, except on spring tides; and when the weather is fair.

But though the Tamar and the Camel are the largest, they are not the only rivers in Cornwall; for besides several creeks that run up a considerable distance from the sea, there are ten pretty large rivers, viz. the Lynher, the Tide, or Tidi, the Seaton, the Loo, the Duloo, the Fawey, the Fal, the Hel, the Lo, and the Heyl.

The Lynher rises among the hills, about eight miles west of Launceston; and after a course of twenty-four miles, falls into the Tamar, as we have already mentioned in describing that river. The stream of the Lynher is very small during the summer months; but during the winter, remarkable for its inundations and rapidity; frequently overflowing its banks, sweeping away, with its impetuous current, ricks, barns, houses, and other objects that oppose its passage.

The Tide, or Tidi, rises on the south side of Caradon Hill, near Leskard, and becomes navigable at a place called Tidiford. About two miles lower, it washes the ancient borough of St. Germans; and joining the Lynher, they both pass into the Tamar.

The Seaton rises in the highlands of St. Clare, about four miles north-east of Leskard; and after a course of near twelve miles, falls into the sea. At the influx of this river, there formerly stood a town of the same name; but as there are no remains of it to be seen, the whole has probably been swallowed up by the encroachments of the sea, which, if the tradition among the neighbouring inhabitants may be regarded, have been very considerable.

The Loo, or East Loo, has also its rise in the highlands of St. Clare; and having flowed about seven miles, becomes navigable at Sand-Place. After which it continues its course about three miles, and falls into the sea between two ancient boroughs, called, from the river, East and West Loo, or Low. Here is a stone bridge of sixteen arches, including two square openings made for the more commodious passage of boats loaded with wood, one hundred and forty yards long, and six feet three inches wide between the walls. Below this bridge is the creek by which small barks came up with the tide.

A mile below Sand-Place, the Loo is joined by another stream from the westward, called the Dulo, that is, the black Loo, or Water. This stream rises in the parish of St. Pinok, and directing its course nearly south, becomes navigable at Trelaunwear, about two miles from the sea; about a mile below, it joins the Loo, and both pass under the stone bridge above-mentioned into Loo Creek. The whole course of this river is about seven miles.

The Fawey, or Fowey, rises in Fawey-moor, not far from Brownwilly, one of the highest mountains in Cornwall. In its course it washes the borough of Lestwithiel, where it passes under a stone bridge of nine arches. Formerly the sea ebbed and flowed above this town, and, according to Camden, brought up vessels of good burden. At present, however, loaded barges can scarce come within a mile of it. About three miles below, the Fawey, having been increased in its passage by several small streams, becomes a deep and wide haven. In two miles more it reaches the town and borough of Fawey, or Fowey, built on its western bank; and a little below, falls into the sea between two old towers built in the reign of Edward IV. a more particular account of which will be given when we come to describe the borough of Fowey. This is thought to be the largest body of fresh water, except the Tamar, in the county of Cornwall.

The Fal is the next navigable stream. It rises about two miles west of Roche Hills, and running about eight miles in a southern direction, becomes a considerable river at the borough of Grampond, or Granpont, where it passes under a stone bridge. About a mile below this bridge, the river was formerly navigable, at least for boats; but the country has for some time been deprived of that advantage: about three miles farther, it reaches the borough and bridge of Tregony. During the last century, one colonel Trevanion undertook to make the river Fal navigable to Grampond, by means of

locks, and had nearly completed this useful design; but the expence proving too great for a single person, it was discontinued, and its advantage lost to the county. A mile below Tregony bridge, the waters, assisted by the tide, and many little brooks, form a creek about three miles long, called Lamoran creek. Here it is joined by Truro creek, a noble body of water; and meeting at the borough of Truro, forms with the tide a navigable canal for ships of one hundred tons burthen to come up to the town quay. Two miles below Truro, it joins St. Clement's creek, which is navigable for barges, as far as Trehliën bridge. About three miles below, the Fal falls into Carreg Rode, the principal branch of Falmouth harbour.

The Hel rises among the hills in the parish of Wendron, whence it runs about three miles to a village called Guyk, whether the barks come up with the tide. Hence it pursues its course about three miles, and then falls into the sea, forming a haven, which, within a mile of its mouth, is deep enough for ships of two hundred tons to ride in safety, and is about a mile wide at its passage into the sea.

The Lo, or Low, rises in the highest part of Wendron parish; and after running about five miles, reaches the borough of Helston; and about a mile below, forms a lake called the Lo Pool.

The Heyl is formed by four brooks uniting at Relubbas, and at about three miles distance, passes under St. Erith bridge, which has been built above four hundred years, and consists of three stone arches. Ships of considerable burden formerly came up to this bridge; but both the valley above, and the haven below it, has been considerably raised; the former by the sand and earth washed down from the hills and mines; and the latter by sand thrown in by the waves from the north sea: so that at present only lighters, and other flat-bottomed craft, come up with the tide of flood, and even these no nearer than about a musket-shot from the bridge. Near the mouth of the Heyl, where it is joined by a brook from the east, a harbour is formed where ships of one hundred tons may ride in safety; and small vessels go up to the village of Lannant, about a mile from the sea. At the mouth of the harbour is a bar, or bank of sand thrown up by the sea, which not only prevents large ships from entering the haven, but even stops the tide of flood for near three hours; so that the tide has flowed three hours on the coast before it enters the Heyl; and it ebbs three hours in the sea after the tide has disappeared in the river. But notwithstanding this disadvantage, many vessels frequent it, especially those laden with coals from Wales.

Remarks on the INLAND NAVIGATION of Cornwall.

Though there are several navigable rivers in Cornwall, yet there is not one of them improved by art, though very capable of it. A navigable cut might be easily made from Launceston to the Tamar, which flows under Polstun bridge, within a mile and a half of that town; and the Aterey, a very considerable stream, washes the walls of Launceston, and falls into the Tamar near the above bridge. From thence the Tamar flows, in a full stream, about twelve miles to Morleham, where the river is already navigable, and where the greater part of the goods from London, Exeter, and Plymouth, as coals for firing, sea-sand for manure, fir-timber for building, &c. are landed, and conveyed in carriages, through very bad roads, to Launceston. Were these difficulties removed, trade would flourish, and employment be found for many hands that are now idle.

Nature has also pointed out another improvement, of the utmost advantage to this county; we mean, the uniting the Fawey on the south coast, with the Camel on the north. The distance between these rivers is only four miles; and even in that intermediate space, there are several small brooks, sufficient to feed a canal cut through this narrow isthmus. It should also be remembered, that the distance between Lestwithiel, to which the tide flows from the south, and Parbrok, washed by the tide from the north, is only eight miles. It would be unnecessary to point out the advantages that must attend an union of these two rivers; they are too obvious to be particularized, and the difficulties that would attend the undertaking too few to discourage the attempt. We have already mentioned that an attempt was made in the last century by one colonel Trevanion, for

for rendering the Fal navigable, and that the whole miscarried for want of assistance. And we shall now add, that a similar experiment was made about the same time, on the river Lynher, in order to estimate the expence; and one lock, with its basin, twelve feet wide, and which raised the water eight feet perpendicular, was finished for sixty pounds. This encouraged the inhabitants to apply to parliament for a bill to render all the rivers in Cornwall, that were capable of it, navigable; but the session was closed before the bill passed the House of Lords; and the civil war, in the reign of Charles I. breaking out soon after, put a final period to this beneficial scheme.

A I R A N D S O I L.

As the greater part of the boundary of Cornwall is washed by the sea, the air must be moister, or more loaden with vapours, and consequently more subject to rain, than in situations farther removed from the coast. But the rains in Cornwall are rather frequent than heavy and excessive; and there are few days so thoroughly wet, as to afford no intermission; nor so cloudy, as to afford no intervals of sunshine; owing, in all probability, to the hilly, narrow, ridge-like form of this county, over which the winds make a quick, because they have a short passage; and the clouds pass over without being detained by forests, and deep valleys.

Storms are more violent in Cornwall than in the inland parts of England. At the same time the air is so impregnated with saline vapours, that it becomes very prejudicial to shrubs and trees growing near the sea coasts; and accordingly very few trees, in such situations, rise above their shelter. This sea air is pernicious to plants in proportion to their tender or robust nature, and the force with which it is driven upon them; and accordingly the young shoots of plants, after a storm, are shrivelled more or less, according as they are exposed to the action of the wind. For this reason, there are few woods on rising grounds, nor any such hedge-rows of tall trees in Cornwall, as there are in the northern counties of England, where, though the wind is sharper, it is not loaded with saline vapours.

From the abundance of mines in Cornwall, the air, in many parts of the county, is filled with mineral particles; and over some of the lodes or veins of metal, these mineral effluvia ascend so copiously, and, at the same time, consist of such inflammable parts, as to take fire. But though the atmosphere is thus loaded with saline and mineral particles, the air is very healthy: it is not charged with the putrid exhalations of bogs, marshes, or stagnating waters surrounded by thick woods. Calms are rarely known to continue longer than one day, so that the air is always in motion, and mists seldom last long.

The winters are milder here than in any other part of England; so that myrtles will flourish without the assistance of a green-house, if sheltered from the sea-winds. Showers of large hail hardly ever happen in Cornwall, and snow seldom lies more than two or three days upon the ground; and as the winters are milder, so the spring shews itself in the buds and blossoms, sooner than in other parts; though perhaps its progress is not so rapid as elsewhere. But the summers are not hotter here than in the more inland counties, owing partly to the sea breezes which keep the air cool, and partly to the reflection of the sun-beams being less from the water than from the land. Hence it happens, that the harvest in Cornwall, though the most southern county in England, is later, and the fruits have less flavour, than in the midland counties. In short, the seasons in Cornwall resemble the neap-tides, they neither ebb nor flow with any great energy; the heat of the atmosphere neither retires so far in the winter, nor advances to that height in summer, as in the inland parts; the sea-breezes equally assuaging the heats of summer, and moderating the winter colds.

The soil of Cornwall is of three kinds, the black and gritty, the shelly and slatty, and the stiff, reddish soil, approaching nearly to the nature of clay.

The highest grounds are covered with the black soil; and on the tops and sides of hills, it is so lax and cold, and its salts so dispersed by the rain and snow, that where it is dry at bottom, it produces nothing but four grass, moss

and heath; or, at best, short dwarf, commonly called Cornish furze. Where the water cannot drain off, small bogs and marshes are formed. Here the soil is deeper, and less gravelly, but yields only a thick brick turf, full of the matted roots of sedge-grass, and other marsh plants, which, when thoroughly dried, make a strong and lasting fuel. In crofts farther down from the hills, this black soil produces a good sward of grass, and affords a winter pasture for horned cattle. It will bear good potatoes, rye and oats; and serves as pasture for milch cows and sheep, especially for rearing young bullocks. Some fields produce considerable crops of barley, but seldom turn to any account when sown with wheat. It is more or less charged with gravel, and the earthy parts exceeding light; so that in a dry summer, the sun soon exhales its moisture; and in a wet summer or winter, much of the vegetable soil is, in the tilled grounds, washed away from the grain.

Great part of the Cornish soil is of a shelly, slatty earth. This is reckoned to bear better corn, especially wheat; as also a stronger spine of grass than the black soil. Drought is the greatest enemy to this porous soil; for part of its moisture escapes through its shelly foundation, and the rest is exhale by the sun-beams; so that the grass and corn always suffer after a long series of dry weather: but droughts of any continuance are so very rare in Cornwall, that the husbandmen have seldom any reason to complain.

The reddish, loamy soil, is of a closer contexture, and consequently retains the moisture of rain, and the salts it receives from the higher grounds, the putrid parts of plants and animals, and the bounty of manures, much longer than any of the soils above-mentioned. This species of soil is most common on level grounds, and gentle declivities, and the crops it produces are larger, and ripen much sooner than those on the blacker and looser soils.

These three sorts of soil are not always equally and specifically distinct from one another; but in different places are so mixed, that the black partakes more or less of the red, and the red of the black, and the slatty of either, or both; nor are they always found in separate and particular tracts, but often so intermixed, that one part of a farm shall be of one soil, and the other quite different.

Of the HUSBANDRY of Cornwall.

The art of husbandry was long neglected in Cornwall; and it was not before the reign of queen Elizabeth, that corn sufficient to supply the wants of the inhabitants, was produced in this country. But since that time, agriculture has been improving; the lands are better fenced; and perhaps it would be difficult to find more profitable inclosures for corn, than on the banks of the rivers Tamar, Camel, Fal, and Fawey.

Lime is greatly used as manure in the eastern parts of Cornwall; for the use of marle is little known, and still less in use. Marle is indeed found in several places, but hardly ever applied as a manure; owing, perhaps, to the plenty of sea-sand and ore-weed. An ingenious gentleman near Treloarwarren made a successful experiment on his farm, with some marle found on the spot; but his example has not yet been followed by the neighbouring farmers.

But the chief manures used in Cornwall are from the sea. Ore-weed and sea-sand are the principal resources of the Cornish husbandmen; the former is found in great plenty on the shore after storms, and certainly deserves a place among the best manures, though too much neglected in many of the maritime counties of England. Some diligence and caution is however necessary; for being a submarine plant, the wind and sun will soon exhale all its moisture. The sooner therefore it is taken from the shore, the better; and being spread on cold stiff land, and then covered with sand, it will soon dissolve into a fat oily slime, which greatly contributes to fatten and meliorate the other manures. Some indeed spread it naked and fresh from the sea, on their barley lands, about the end of March, or the beginning of April, and have generally a good crop of corn; but the weeds grow afterwards so plentifully and rank, that no wholesome grass for pasture must that year be expected.

The sea-sand used as a manure in Cornwall, is of different kinds: some of it is found mixed with slime, with spar, with shells, and with coral. If mixed with slime, it adds a considerable richness to the soil. When the sand is of a sparry, calcareous substance, and will ferment with acids, it acts as lime, and will of itself fertilize the ground in proportion to the quantity of lime it contains. The sand which is plentifully mixed with shells, and their fragments, is still more useful as a manure; for as shells are of the nature of lime, moulded and fixed by an unctuous cement, this manure will communicate at once the heat of lime, and the fatness of oil to the land it is laid upon, in proportion to the quantity of shells it contains.

But the best of all the Cornish sands, is that which is intermixed with coral. This excellent manure is principally found in Falmouth harbour, and near the adjacent shores. It is taken up by a large bag of strong canvas, having an iron hoop fixed to its mouth for keeping it open. This bag, with its proper additions, is sunk to the bottom, and dragged along till full. A barge-load of this coral sand is usually delivered for ten shillings, or less, if near the place of dredging; and where the land is good, a barge load will be sufficient to dress an acre of ground. This manure is more used for corn than pasture. The fertility of coral is owing to the same cause as that of shells; for it is of the same calcareous nature; but being more solid than shells, it conveys a greater quantity of fermenting particles to the soil: nor does it dissolve so soon in the ground as shells; but by decaying more gradually, continues longer to impart its warmth to the juices of the earth.

Another manure used in these parts of this county near the fishing towns, consists of bruised, decayed pilchards, not fit for the market, and of the refuse of the salt used for curing those fish. This manure may be justly reckoned one of the richest that can be procured in any country; it will warm the coldest land, cause it to throw forth plenty of wholesome grass, as well as corn; and by the verdure it supports, demonstrates its lasting, enlivening virtue, even for some years after it has been laid on the land. But as it is extremely hot, it is better after being formed into a compost dunghill, with heaps of earth and sand; whence, after its salts are properly digested, the whole is to be carried out and spread upon arable land.

We have been the more circumstantial in our accounts of the above manures used in Cornwall, from a persuasion that some of them may be useful in other maritime parts of this kingdom. With regard to other manures, arising from putrefaction, burning the soil, and the dung of animals, it will be needless to say any thing particular of them, as they are common in every county, and the management of them in Cornwall the same as elsewhere.

The grain principally sown in Cornwall, are wheat, barley, oats, and rye; besides which, they sow the *avena nuda* of Ray, called by the country people *Pilez*. It is a small yellow grain, answers all the purposes of oat-meal, and is accounted superior to any other nourishment for fattening calves. It will succeed on the poorest land, which has been tilled two or three seasons before with potatoes. The turnip husbandry has of late years obtained in this county; and several gentlemen have experienced the benefit of that useful root, in feeding sheep and other cattle, as well as in mellowing the land for corn. The potatoe, a still more useful root, is cultivated every where, and, if seasonably tilled, thrives best in shallow poor lands.

They have a singular custom in Cornwall of binding into sheaves the barley, and all other grain, as well as the wheat; and for the better security of their corn, while it continues in the field, the sheaves are formed into what they call *Arish-mows*. They are built up into a regular solid cone, about twelve feet high, and the ears all turned inwards, so that only the but-ends of the sheaves are exposed to the weather: the whole cone, or *arish-mow*, being finished by an inverted sheaf of reed or corn, tied to the upper rows. In all probability, the inconstancy and moisture of the weather in Cornwall first gave rise to this custom: but from whatever cause it proceeded, experience has justified the precaution, as the grain is thereby much better preserved.

We shall conclude this account of the husbandry of Cornwall with observing, that in a plentiful year some

grain can be spared for exportation; in a moderate year, there is just a sufficiency for home consumption; and in a year of scarcity, it becomes necessary to purchase from foreign countries.

Of the MINES of Cornwall.

There are mines of various substances in Cornwall, but the principal product is tin and copper. It has been long famous for the former, and still affords employment, and consequently subsistence, to the poor, affluence to the lords of the soil, a considerable revenue to the prince of Wales, who is duke of Cornwall, and an important article of trade to the nation, in all the foreign markets of the known world.

Tin is found either collected or fixed, or loose and detached: it is found collected either in a vein, which the miners call a lode; or in a horizontal layer of ore, called a floor; or interspersed in grains and bunches in the natural rock. It is found loose and detached, either in single separate stones, called *Shodes*, or in a continued course of such stones, called by the miners *Beuheyl*, which, in the Cornish language, signifies the living stream; for when a stone has no metal in it, the miners say, it is dead; or, lastly, in a powder by itself.

A floor is sometimes found at the depth of many fathoms, and the same ore is often found in a perpendicular lode for many fathoms, and then diffused into a floor. The mines in which these floors are found, are very dangerous, as the greatest care is necessary to support the vast mass of earth, rocks, &c. undermined, by digging out a horizontal stratum of ore, many fathoms below the surface. This precaution, which cannot be taken without considerable expence, was some years since neglected; and the consequence was, that the ground sunk down at once, without the least notice, and buried all that were in the mine.

Water is one of the most troublesome accidents attending the Cornish mines, every fissure that is cut through, throwing forth its water into the cavity where the miners work. It is therefore necessary to discharge this water by some adit or passage. In order to this, some hydraulic machine is necessary; that most commonly used for this purpose, is the steam engine, a contrivance too well known to need any description here.

When the ore is taken out of the mine, it is carried to the stamping mill; and if full of clammy slime, thrown into a pit called a *buddle*, to make it stamp the freer without choking the grates; but if free from slime, it is shovelled into a sloping canal of timber called the *Paſs*, whence it slides by its own weight, and the assistance of a small stream of water, into the box where the lifters work. In this box, by the great weight of the lifters, which are raised by a water wheel, falling on it, the ore is pounded, or stamped small enough to pass through the holes of an iron grate fixed in one end of the box. To render the lifters more lasting, and at the same time to increase their weight, they are shod or armed at the bottom with large masses of iron of one hundred and forty pounds weight each, called *stamp-heads*; and to assist the attrition, a rill of water keeps the ore perpetually wet, and the *stamp-heads* cool, till the ore in the box is sufficiently pulverized. From the grate above-mentioned the tin is carried by a small gutter into the *fore-pit*, where it makes its first and purest settlement, the lighter parts running forward with the water, through holes made in the partition, into the middle pit, and thence into the third, where what is called the *slime settles*, and what runs from thence is good for nothing. From these pits it is carried to the *buddle*, and thence to the *keeve*, where it is thoroughly washed from all its filth, when it is fit to be sent to the *melting-house*, and is called *black tin*.

But if *mundic*, or other semi-metals, are incorporated with the tin-ore, the whole must be burnt, and the sulphur, &c. evaporated, before the water will be able to wash away the remains of the semi-metal, and leave the tin behind; these semi-metals being specifically heavier than tin.

The tin ore being thus dressed, it is carried in sacks to the *melting-house*, where it is melted in a reverberatory furnace, with a fire of *pit-coal*; and when sufficiently melted,

melted, is poured into quadrangular troughs, or moulds of stone, containing about three hundred and twenty pounds weight of metal, which, when hardened, is called a block of tin, and carried to one of the coinage towns.

Five towns are appointed for this purpose, in the most convenient parts of the county for the tanners, to one of which they bring their tin every quarter of a year. When the tin is brought to the coinage town, the officers appointed by the duke of Cornwall assay it; and if they find it well purified, stamp the face of the block with the impression of the seal of the dutchy; which stamp is a permission for the owner to sell, and, at the same time, an assurance that the tin so marked has been duly examined and found mercantable. The stamping this impression by a hammer, is called coining the tin. Every hundred weight of tin so coined pays to the duke of Cornwall the sum of four shillings before it can be disposed of, and this raises a revenue of above ten thousand pounds a year. And from a moderate computation, it appears, that the value of the tin raised in the whole county, has, for some time past, amounted to near two hundred thousand pounds per annum, one year with another. And it should be remembered, that this prodigious revenue is produced by a narrow slip of land, of the most barren and hilly kind, without distressing the tillage, pasture, or fishery.

The mines of copper are very rich, though they have not been worked to great advantage above sixty years. The most common sort of ore is of a yellow or bruis colour; but there is some green, some blue, some black, some grey, and some red: the green, blue, and black, yield but little; the grey contains more metal than the yellow, and the red more than the grey. There are, besides, in almost all the considerable mines, small quantities of malleable copper, which the miners, from its purity, call virgin ore. This is combined and alloyed with various substances; sometimes with base crystal, sometimes with a gravelly clay, and sometimes with the rust of iron: its figure also is very various; sometimes it is found in thin plates shaped like leaves, sometimes in drops and lumps, sometimes branched, fringed, or twisted into wires; sometimes it shoots into blades cropped at the top like a dagger; and sometimes it has the appearance of hollow fillagree. It has also been found in powder almost equal in lustre to that of gold; in a congeries of combined granules; and sometimes in solid masses of several pounds weight, matured, unmixed, and highly polished.

With regard to the mining part, the copper-works do not materially differ from those of tin, but the method of dressing or preparing the metal for sale, is very different. To separate the good ore from the bad with greater advantage, certain overseers are appointed to superintend the labouring miners, and take care that all the richer sorts of ore are kept together, then raised up as unmixed as possible, and laid on the grass in distinct heaps; and because there will be some waste in breaking, the ore is taken out of the lode; and drawn up in as large lumps as the tackle of the engine will master. As soon as the ore arrives at the mouth of the shaft, it is re-examined, the best broken small with hammers, which they call spalling, or brought away to the adjacent bucking-mills, where there are persons ready to bruise it upon a rock with short bars of iron, whence it is carried to the heap of best ore; and what is not worthy of the first place, is laid by to make another sortment. The best small ore is then washed and sifted, by which means the waste, or barren stone, is discovered and thrown away. The poorer ore is carried to the stamping-mill, where it is pounded, washed, &c. nearly in the same manner as the tin ore.

The copper ore being thus dressed and sorted, is sold to the agents of the copper companies in Wales or Bristol, and shipped off for those places, where it is melted and refined.

The annual revenue to the county from the copper-mines, is at present almost equal to that of tin; having, for several years past, amounted to more than one hundred and sixty thousand pounds annually; and both seem still capable of improvement.

The water in which the copper-ore is washed, has been lately discovered to make as good blue vitriol as any in the world; and the water which comes from the bottom of the

mines, and now suffered to run off to waste, is so strongly impregnated with copper, that if detained in proper receptacles, it would produce great quantities of valuable copper, without any hazard or attendance, and without any other expence than the purchase of a much less quantity of the most useless old iron; for old iron, immersed in this water, will, in about fourteen days, produce more than its own weight of what is called copper-mud, or more properly copper-dust, whence a large proportion of pure copper may be obtained. For the vitriolic fluid in which the copper is dissolved, being more strongly attracted by the iron, will leave the particles of copper, which will then be precipitated in dust or granules; the particles of the menstruum, at the same time, dissolving, and carrying off the iron.

The advantages that would attend this undertaking may be computed, in some measure, from the following calculation made at the copper mines at Arklow in Ireland, and inserted in the Philosophical Transactions for the year 1752. "One ton of iron bars immersed in the adit, produces, in twelve months time, one tun, and nineteen hundred and a half weight of copper-mud, or dust; now each ton weight of mud, when melted, produces sixteen hundred weight of the purest copper, selling at ten pounds per ton more than the copper extracted from the ore. In these mines the proprietors had at one time five hundred tons of iron, and might, with proportional advantage, have laid in as many thousands. The softest iron is best for this purpose." But it is not every stream coming from a copper lode that will produce such a surprising quantity of copper; but the experiment will certainly answer under proper directions.

It is also probable that silver might be found, if the lodes of copper ore were properly traced and examined; for the mines of Osloquee in Peru, were at the top almost wholly copper; and every spade's breadth, as the miners dug downwards, grew more and more rich in silver, till at length the silver was found without any mixture of other metal. And in the mines of Cornwall, silver has been frequently found in the pursuit of a vein of pure copper.

Gold has also been often found, though in small quantities, in the Cornish mines; and there is the greatest reason to think, that if a proper search was made by a diligent and skilful hand, a quantity of that precious metal, sufficient to repay the trouble and expence, would be discovered.

Iron and lead are also found in several parts of Cornwall, though there are no mines of the former yet worked in the county; and only two or three of the latter.

Of the PILCHARD FISHERY.

This fishery is almost peculiar to Cornwall, and therefore must not be omitted here. The pilchards come from the north seas during the summer months in immense numbers; and about the middle of July, reach the islands of Scilly and the Land's End of Cornwall, shifting their situation as the season prompts, and their food allures them; and thus, by a tour to the warm southerly coast of Britain, they strengthen and prepare themselves, and their young ones, to return to the great northern deeps, for the sake of spawning, and securing themselves during the stormy season. The pilchards continue off and on in the south channel, principally from Fowey harbour westward; and are taken sometimes in prodigious quantities, at Mevagissy, in the creeks of Falmouth, and Helford havens; in the creeks of St. Kevran, and in Mount's Bay: some pilchards are also taken in St. Ives' bay, in the north channel. They are taken in seyne and drift-nets; and the fishermen directed to the shoals of fish by persons posted on the highlands near the shore, who discover them by the colour of the water, and make signs to the boats where to cast their nets.

When taken, the fish are brought to a warehouse on shore, where they are laid up in broad piles, and salted, as they are piled up, with bay-salt. In this manner they lie soaking twenty or thirty days, during which time a great quantity of blood, dirty pickle, and bitter, drains from the fish. When taken out of the pile, there remains a great deal of salt, &c. at the bottom, which, with an addition of fresh salt, serves for another pile.

The next process is to wash them in sea-water, in order to clear off the dirt and blood; and when dry, they put them into hogheads, pressing them down hard to squeeze out the oil, which issues through a hole at the bottom of the cask; and in this state they are sent to market.

This fishery is of the greatest advantage to the county of Cornwall: it employs a great number of fishermen in catching the fish; and many more, besides women and children, in salting, pressing, washing and cleaning; in building boats, making nets, ropes, casks, &c. The poor are fed with the offals, the land enriched with the refuse of the fish and salt; the merchant finds the gains of commission and honest commerce; the fisherman the gains of the fish. Ships are often freighted to Cornwall with salt, and into foreign countries with the fish. By an exact computation of the number of hogheads exported annually, for ten years successively, viz. from 1747 to 1756 inclusively, from the four ports of Fowey, Falmouth, Penzance, and St. Ives, it appears that Fowey exported yearly one thousand seven hundred and thirty-two hogheads, Falmouth fourteen thousand six hundred and thirty-one hogheads and two thirds; Penzance and Mount's Bay twelve thousand one hundred and forty-nine hogheads and one third; St. Ives twelve hundred and eighty-two hogheads; amounting in all to twenty-nine thousand seven hundred and ninety-five hogheads. And every hoghead, together with the bounty allowed for every hoghead exported, and the oil made from each hoghead, amounted, one year with another, at an average, to one pound thirteen shillings and three-pence; so that the cash paid for pilchards exported, has, at a medium, annually amounted to the sum of forty-nine thousand five hundred and thirty-two pounds ten shillings.

BOROUGH, MARKET-TOWNS, and other Places of Note in Cornwall.

In our tour through Cornwall, we entered the county at Saltash, a borough town situated on the declivity of a steep hill, two hundred and twenty-six miles from London, but not more than three from Plymouth-Dock, to which there is a ferry over the Tamar, called the Crimble Passage. It was incorporated by a charter of king Charles II. and is governed by a mayor, and six aldermen, who are styled the council of the borough, and, with the burgeses, may chuse a recorder. The corporation claims the sole property of the oyster fishery in the whole river, except between Candlemas and Easter, which is considerable. The corporation have also jurisdiction on the river Tamar, down to the mouth of the port; and by virtue of that jurisdiction, demand anchorage and salvage from all foreign ships and vessels that enter the port; and raise a yearly revenue on boats and barges passing on the river. They have likewise all the profits of the Crimble ferry, together with the tolls of the markets and fairs, the manor of the borough being vested in them on their paying a reserved rent of eighteen pounds a year to the duke of Cornwall.

The harbour will receive ships of any burthen; and the inhabitants carry on a considerable trade in malt and beer. Some merchants here have also ships, which are used in the fishery at Newfoundland. The church is a chapel of ease to the parish of St. Stephen, in which it stands. Here is a handsome market-house, a town-house, and a free-school. The market, which is on Saturday, is well frequented by the inhabitants of Plymouth-Dock, who resort thither to furnish themselves with necessaries; for they chuse rather to go to Saltash market in the town boat, than by land to Plymouth, because provisions are much cheaper at the former than at the latter; and at the same time, the boat brings home what they purchase without any additional expence.

The borough of Saltash sends two members to parliament, a privilege it has enjoyed ever since the latter end of the reign of Edward VI. Here are two annual fairs, one on the second of February, and the other on the fifth of August, and both for cattle.

During our short stay at Saltash, we made a very agreeable voyage to Mount Edgecombe, the beautiful seat of lord Edgecombe. It is situated on the western side of the entrance of Hamoze, and is a noted sea-mark. It stands in the center of a delightful park, and the prospect from it is

beautiful beyond description. The many ships passing up and down the winding harbour below it, together with those going up and down the English Channel, at different distances, some near the shore, and others as far off as the eye can reach, afford a scene at once remarkably beautiful and pleasing.

About six miles from Saltash, and two hundred and twenty from London, is the borough of St. Germans, so called from St. Germanus, a bishop of Burgundy, who came into England to preach against the Pelagian herefy, and settled here. It has not long enjoyed the privilege of sending members to parliament, this honour being conferred upon it in the third year of the reign of queen Elizabeth.

The borough of St. Germans is situated on an irregular rock, in the form of an amphitheatre, and washed by the river Tide. It was formerly a considerable town, but now dwindled into a mean village, consisting chiefly of cottages, inhabited by fishermen; and the market, which was held on Friday, and well frequented, is now disused. There are, however, two fairs still kept here for the sale of cattle; the first on the twenty-eighth of May, and the second on the first of August. It is governed by a mayor, assisted by inferior magistrates. The mayor is also bailiff of the borough, and can make any house in the place the prison of the person he arrests.

St. Germans was once the see of a bishop, founded in honour of St. Germanus, above mentioned. In the year 936, one Conan is said to have been made bishop of this see by king Ethelstan; but the church was more amply endowed by king Canute: and about the year 1050, Leofric, bishop of St. German's and Crediton, having united both bishoprics in the church of St. Peter at Exeter, changed the seculars into regular canons, governed by a prior. At the suppression of monasteries, the yearly revenue of this priory was valued at 243l. 8s. The church, of which we have given a perspective view, is large, and not ill built, with an episcopal chair and stalls for the prebends.

In the year 1507, the family of Eliot purchased the priory house, naming it Port-Eliot, and in this ancient family it still continues. The above gentleman was a great benefactor to St. Germans; he endowed a public school, repaired the sessions-house, and beautified the church, where there is a fine monument of Italian marble erected to his memory by his widow.

The parish of St. Germans is the largest in the whole county, being twenty miles in circumference, and containing seventeen villages: it is also supposed to include more gentlemen's seats and lordships than any other in England.

Leskard, which we next visited, is about five miles from St. Germans, and two hundred and twenty-nine from London. It is an ancient borough, having sent members to parliament ever since the twenty-third of Edward I. It is governed by a mayor and burgeses, and endowed with the power of purchasing lands, and of holding them by perpetual succession. It was first incorporated by Edward earl of Cornwall, but the charter, by virtue of which it is now governed, was granted by queen Elizabeth.

In the reign of king James I. when Carew wrote his Survey of Cornwall, it consisted of little else than the ruins of ancient buildings, which sufficiently shewed it had once been a place of consequence. It had a strong castle, and a large structure, where the ancient dukes of Cornwall kept their courts; it also enjoyed several considerable privileges, especially by favour of the Black Prince, who, as duke of Cornwall, resided here. But since the time of James I. the town has greatly recovered itself, and is now one of the largest and best built places in Cornwall. It is seated on a hill, has a market on Saturday, well frequented; is the residence of many people of fashion, and one of the stannary towns for Cornwall. The church is large, and the town-hall a handsome building, erected on stone pillars, and on the top a turret, containing a clock with four dials. Here is likewise a curious conduit, a meeting-house, and a free school. A very considerable trade is carried on here with the neighbouring towns, in boots and shoes; and large quantities of yarn, for the clothiers of Devonshire, are spun here. Here are seven annual fairs, viz. on Shrove Monday, Monday se'ennight before Easter, Holy Thursday, August 15, St. Matthew, September 21, and December 10. for horses, oxen, sheep, cloth, and a few hops.

A few

A few miles to the north of this town, in the parish of St. Cleere, is a famous piece of antiquity, which they call "The other Half-Stone." This monument at present consists of two stones separated from one another, and fixed in the ground; but by mortises in each, seem to indicate that they were originally joined together. Both are curiously carved in drapery work; and on one of them is an inscription, in very antique characters, implying, that Dun-garth, or Doniert, (one of the kings of Cornwall, who was drowned in the year 782) gave this land for the good of his soul.

Not far distant from the above monument, is a pile of rocks placed one upon another, and called Wring-Cheefe, from some of them resembling large cheefes pressed by the superincumbent weight.

This remarkable pile of rocks, which attracts the admiration of all travellers, is thirty-two feet high; and the stones towards the top, being prodigiously larger than those in the middle, or nearer the foundation, project so far over the middle part, that it has been a matter of wonder how so ill constructed a pile could, for so many ages, resist the storms of this exposed situation. Some are of opinion, that this enormous pile is the work of art, but the generality of writers think it was formed by nature. The upper stone is said to have been formerly a logan, or rocking-stone, which, while it was entire, might be easily moved with a pole; but great part of the weight, which kept one end of it in an equipoise with the other, having long since been taken away, the upper stone is now immovable. On the top are two regular basons, but part of one of them is broke off. From these particulars there is great reason to think that this pile was formerly consecrated to some religious purpose; perhaps it was one of the rock deities of the Druids.

About a mile to the northward of the village of St. Cleere, and near the above pile of rocks, is another remarkable piece of antiquity, formerly consisting of three circles, marked out by stones in their peripheries, and having their centers in a right line; but many of the stones are now taken away. The country people call this monument the Hurlers, from a vulgar tradition that the stones were once men, thus transformed, as a punishment for their hurling (a sport common in Cornwall) on the Sabbath.

From the borough of Leskard, we passed near the banks of the river to East Loo, or Low, situated at the mouth of the river of the same name, about two hundred and thirty-two miles from London. This town is governed by nine burgeses, one of whom is annually chosen mayor, with a court of aldermen and recorder. It first enjoyed the privilege of sending members to parliament in the thirteenth year of the reign of queen Elizabeth. The manor is held by the corporation of the dutchy of Cornwall, at the annual rent of twenty shillings. The town stands in the parish of St. Martin's, and the church is only a chapel of ease. The inhabitants carry on a considerable trade, especially in pilchards, the fishery of which is here carried on to great advantage. The town has a wall next the sea, and on it a battery of four guns. Here is a market on Saturday, and two fairs; the first on the thirteenth of February, and the second on the tenth of October, both for cattle.

On the other side of the river is the borough of West-Low, which first sent members to parliament in the sixth year of Edward VI. These two boroughs are joined together by a bridge of fifteen arches, and one hundred and forty-one yards in length, built across the river, which is navigable for vessels of considerable burthen; and the harbour below the bridge commodious.

West-Low, which is also called Port Pigham, is governed by twelve burgeses, one of which is annually elected mayor, and a recorder. The corporation holds the manor of the dutchy of Cornwall at the annual rent of twenty-four shillings. Here was formerly a chapel of ease to the church at Talland, in which parish it stands; but the chapel having some years since, been converted to a town-hall, the inhabitants go to Talland to hear divine service. Here is a fair for cattle, &c. on the fifth of March.

In the neighbourhood of West-Low are the remains of a Roman work, called the Giant's Hedge. It is a large mound, extending from the valley in which this borough is situated, to Leryn, on the river Fowey. It is first visible

near West-Low, and in some places is seven feet high and twenty feet wide at a medium. This risbank or mound ranges up hill and down hill indifferently, has no visible ditch continued on any brow of a hill, as intrenchments always have; there is no hollow nor pass on one side more than the others; it is about seven miles long, and tends straight from Low to Leryn creek, in a direct line to Leftwithiel.

From Low we continued our tour to Fowey, or Fawey, a borough town situated on a river of the same name, two hundred and forty miles from London. It is governed by a mayor, recorder, eight aldermen, a town-clerk, and other officers. The corporation enjoy the tolls of the fairs, and quayage of the harbour, for which they pay a reserved rent of forty shillings per annum to the dutchy. It is a large and populous town, extending above a mile in length on the east of the river. The buildings are handsome, and many considerable merchants reside here, who carry on a pretty good trade, and have a considerable share of the pilchard fishery. The church is ancient, but elegant. Here is also a free school, and a public hospital.

The harbour of Fowey is safe and commodious, and had formerly a strong fort on each side of the entrance, built by Edward IV. with a chain extended from one to the other, quite across the river. The remains of the forts are still visible, and appear as in the view annexed; but the chain has long since been taken away. The entrance is, however, still defended by block-houses mounted with cannon.

This town was formerly in a very flourishing condition, there being at one time above sixty sail of ships of war and merchantmen belonging to it, with which the inhabitants signalized themselves during several reigns. In sailing by some of the cinque ports, and refusing to strike their colours, a battle ensued, in which the Fowey men were conquerors; and, as a memorial of their triumph, quartered the arms of all the cinque ports with their own. Fowey is still a member of the cinque ports, having obtained that honour by succouring some ships of Rye that were in distress. This borough has sent members to parliament ever since the thirteenth year of the reign of queen Elizabeth. It has a market on Saturdays, and two fairs for cattle, one on the first of May, and the other on the tenth of September.

Leftwithiel is a borough town about two hundred and thirty-nine miles from London, and five miles north-west of Fowey, situated on the same river, which was formerly navigable as high up as this town, but is now choaked up with sand, which has greatly lessened its trade. It was formerly the residence of the duke of Cornwall, and the ruins of the ducal palace are still to be seen on a rising ground at a little distance from the town. The place is well built, but not populous; and the church is a handsome structure, but the steeple still carries the marks of the civil war in the reign of Charles I. when the great hall and the exchequer, belonging to the dukes of Cornwall, were entirely defaced.

It is governed by a mayor, seven capital burgeses, and seventeen assistants, or common council; and enjoys the bushelage of coals, salt, malt, and corn, sold in the town of Fowey, together with the anchorage in that harbour, for which privilege it pays a reserved rent to the dutchy of eleven pounds nineteen shillings and ten-pence. A very considerable trade was formerly carried on here, when the river was navigable: at present, the principal part remaining is a branch of the woollen manufacture.

The place has, however, still some peculiar privileges. The common jail for all the stannaries, and their several weights and measures, are kept here: and for many years, a very remarkable cavalcade, in memory of the ancient splendor of this place, as the metropolis of a principality, was annually exhibited. The freeholders assembled on Low Sunday, when one of them, chosen by rotation, was superbly dressed in royal robes, with a crown on his head and a sceptre in his hand, and mounted on a horse richly caparisoned. In this stately manner he proceeded through the town, with a sword of state carried before him, and attended by the rest of the freeholders on horseback to the church, where he was received by the priest, and conducted to a seat erected for the ceremony. When the service was ended, he returned with the same pomp to a house appointed for the purpose, where an elegant entertainment was prepared for him and his attendants, at which he presided with

with all the dignity of royalty, being served upon the knee, with all the ceremony used to a sovereign prince. But this custom has been now laid aside many years. Here are three annual fairs for cattle, &c. viz. on the twenty-ninth of June, the twenty-fourth of August, and the second of November.

From Lestwithiel we proceeded to Grampond, and passed through the little town of St. Austle, which lies about midway between them, but has nothing remarkable. It has a small market on Fridays, and three annual fairs, viz. on Good-Friday, Whitfun-Tuesday, and the tenth of November, for horses, oxen, sheep, cloth, and a few hops.

Grampond is a borough town two hundred and fifty-one miles from London, and situated on the river Fal, over which it has a stone bridge. It is governed by a mayor, eight aldermen, a recorder, and a town-clerk. The corporation enjoys many privileges, particularly a freedom from toll throughout the whole county. These privileges are held of the dutchy, under a reserved rent of ten pounds eleven shillings and one penny *per annum*. It sends two members to parliament, a privilege it has enjoyed ever since the latter end of the reign of Edward VI. It is a very small place, consisting only of a single street, and has no church, but a chapel of ease to the parish church, which is at Creed, about a quarter of a mile from the town. A considerable manufacture of gloves is carried on here; and the market, which is on Saturday, is pretty well frequented. It has three annual fairs for cattle, viz. on the eighteenth of January, the twenty-fifth of March, and the eleventh of June.

Some think that this was the Voluba of the Romans, because it stands upon the same river, and that its name was changed into Grampond, or rather Grandpont, the great bridge, on building the bridge across the river. John of Eltham granted the corporation the whole vale of Grampond, and all the lands of Coytfala, or Falawood, still the name of some lands near the town, and within the precincts of the borough.

Proceeding to the southward, along the banks of the Fal, we came to Tregony, a borough town situated on the same river, two hundred and fifty-six miles from London. It was incorporated by James I. and is governed by a mayor, recorder, and twelve capital burgessees. The river is navigable from this town to Falmouth. We have already mentioned, that an attempt was made in the last century to render the river navigable from this town to Grampond, by one colonel Trevanion, and miscarried, when almost completed, for want of assistance. Here is a manufacture of ferges, which employs a number of hands. The manor belongs to the ancient and noble family of Boscawen, to whom it descended in right of Edward I. A market is held here on Saturday; and five annual fairs, viz. on Shrove Tuesday, the third of May, the twenty-fifth of July, the first of September, and the sixth of November, for cattle.

Keeping still on the same side of the river, we came to St. Mawes, a small borough town two hundred and eighty-two miles from London. It stands on the west side of the entrance into Falmouth haven, but is only a hamlet to St. Just, a town about two miles distant, without either market, church, chapel, or meeting-house. It consists only of a single street under a hill fronting the sea, and the inhabitants subsist wholly by fishing. It has however enjoyed the privilege of sending two members to parliament ever since the fifth year of the reign of queen Elizabeth. Here is a fortification called St. Mawes Castle, built by Henry VIII. for the security of Falmouth-haven; and on the opposite side another fortification, called Pendennis castle. St. Mawes castle has a platform of guns pointing across the channel, level with the water. It has a governor, a deputy, and two gunners. Pendennis castle, on the opposite side, is said to be the largest castle in England, is regularly fortified, and has generally a strong garrison.

From St. Mawes we crossed the harbour to Falmouth, a town situated at the mouth of the Fal, two hundred and eighty-two miles from London. It is governed by a mayor and aldermen, but sends no members to parliament, though the richest and best trading town in the whole county. It is so commodiously situated, that ships of any burthen

come up to its quay; and the harbour is so very capacious, that the whole navy of England may ride here in the utmost safety; being next to Milford-Haven, the best road for shipping in Great Britain. The town is well built, and its trade very greatly increased since the reign of king William III. when packet-boats were established here for Spain, Portugal, and the West-Indies. Great quantities of gold, both in specie and bars, are brought over by those vessels on account of the merchants of London, &c. but the Falmouth merchants now carry on a very considerable trade with the Portuguese in ships of their own. They have also a large share in that profitable branch of commerce, the pilchard fishery.

The church is well built, though formerly only a chapel of ease to the parish of St. Gluvias; but was constituted a parish church by an act of parliament passed in the sixteenth year of the reign of Charles II. The custom-house for most of the Cornish towns, as well as the head collector, is established here, where the duties, including those of the other parts, are very considerable. Here is a large market on Tuesday, and two annual fairs for cattle, viz. on the twenty-seventh of July, and the tenth of October.

About three miles from Falmouth, and on the same side of the river, stands Penryn, two hundred and sixty-four miles distant from London. It was incorporated by king James I. and is governed by a mayor, eleven aldermen, a recorder, and a common council, who are invested with the power of trying felons in their own jurisdiction.

The town is situated on a hill, surrounded with so many gardens and orchards, that it appears like a town in a wood. A branch of Falmouth harbour flows up on both sides of Penryn, where there is a custom-house, quay, and other neat buildings adapted to trade. The adjacent country is finely diversified with rivulets, which supply the town with water. Several reputable merchants reside in Penryn, where a considerable trade is carried on to Newfoundland, and in catching, salting, and exporting pilchards.

Some years since, a woollen manufactory was established here, by a company of public-spirited gentlemen, in order to manufacture the wool produced in the neighbourhood, which before had been sold, unmanufactured, to chapmen who travel about the country for that purpose; or, what was still worse, sent clandestinely to France, in exchange for tea and brandy; to the inconceivable advantage of our rival nation, and of the most pernicious consequence to our own. This manufacture has succeeded even beyond expectation, and employs, in its different branches, above a thousand people. The goods they make for sale, and which, by repeated trials, they find they can send to foreign markets as good in quality, and on equal terms with the manufacturers in other parts of the kingdom, are coarse broad-cloths, druggets, duffes of all kinds, bays, barragons figured and plain, watered grograms, corded and figured everlastings, figured and plain duroys, plushes, durants and shalloons; besides some other particulars, not considered as standing articles. By such a variety of particulars, they are at liberty to shift their hands from one kind of looms to another, till the greater part of their workmen become capable of almost every kind of weaving. This enables them to execute any extraordinary orders they may receive from their factors; and upon the decline of sales abroad for any one assortment, transfer their labourers to another branch. By this precaution they are under no necessity of discharging any of their people, and at the same time enabled to work up all the different sorts of wool which the country produces, to the great relief of the industrious poor.

Here was formerly a collegiate church, founded by Brovescomb, bishop of Exeter, in the year 1270; and the ruins of this structure, consisting of a tower and part of garden walls, are still remaining. It was dedicated to the Virgin Mary, and St. Thomas of Canterbury; consisted of a provost, a sacristy, eleven prebendaries, seven vicars, and six choristers; and was valued, at the suppression of monasteries, at two hundred and ten pounds, thirteen shillings and two-pence *per annum*.

The manor, together with the tolls of the fairs and markets, belong to the corporation, who hold them from the bishop of Exeter, under a small reserved quit-rent. The markets are on Wednesdays and Saturdays, and the fairs

fairs on the first of May, the seventh of July, and the twenty-first of December; all of them chiefly for the sale of cattle.

A very remarkable event happened here in the sixteenth century. The Spaniards, then at war with England, had found means to land in so secret a manner near Penryn, that the inhabitants had not the least intimation of their danger; but as they approached near the town, and were just going to put their cruel design into execution, the owners of a puppet-show, which happened to be then in the place, were just setting Sampson upon the Philistines; and the drums and trumpets, which were sounded on that occasion, being heard by the Spaniards, they imagined that the place was alarmed, and that a superior force was coming against them; upon which they retreated, with great precipitation, to their ships, and before another attempt could be made, were obliged to quit the coast.

Penryn sends two members to parliament, and has enjoyed that privilege ever since the first year of queen Mary's reign. King James II. in pursuance of his scheme for enslaving the nation, by putting all corporations under the power of the crown, granted this place a new charter, whereby the election of their members was vested in the magistracy only; but this was so evidently subversive of the liberty of the people, that it was never practised; and every inhabitant that pays scot and lot has a vote at the election of representatives.

From Penryn we made a pleasing voyage, by water, to the borough town of Truro. The country, on both sides, is beautifully pleasant, and finely diversified with hills, vales, and gentlemen's seats.

Truro is situated between two rivers, at the upper end of one of the arms of Falmouth Haven, two hundred and seventy-four miles distant from London. The two small rivers above-mentioned, which almost surround the place, form a large wharf, with a commodious quay for vessels of about an hundred tons burden. It was first incorporated by king John, and a new charter afterwards granted by queen Elizabeth; and is now governed by a mayor, four aldermen chosen out of twenty-four capital burgesses, and a recorder. The mayor of Truro is also mayor of Falmouth, and the quaying of goods shipped or landed there belongs to this corporation. When the mayor is elected, the mace is delivered up to the lord of the manor, till sixpence for every house in the town is paid, by way of acknowledgment, and then it is returned to the mayor by the lord's steward.

The streets of Truro are regular; and the church, which is very capacious, and of the old Gothic architecture, not inferior to any in the county. The market-house is large, and well adapted to the purpose; and the town-hall, where the quarter sessions of the peace for the south and north divisions are held, is a handsome building.

This is one of the towns for coining tin, and the lord warden of the stannaries holds his parliament here.

By a charter granted in the thirty-third year of Edward I. the tanners of Cornwall were made a distinct body from those of Devonshire; whereas, before that time, it was the custom for the tanners of both counties to meet on Hengiston-hill every seventh or eighth year, in order to consult the common interest of both parties. Two coinages yearly were also granted by this charter; and the tanners had the liberty of selling their own tin, unless the king insisted on purchasing it himself.

A further explanation of the Cornish privileges and laws was made in the fiftieth year of Edward III. and their liberties confirmed and enlarged by parliament in the eighth of Richard II. the third of Edward IV. the first of Edward VI. the first and second of Philip and Mary, and in the second year of Elizabeth; and the whole society of the tanners of Cornwall, till then reckoned as one body, was divided into four parts, and distinguished by the names of the principal tin-mines of that time. One general warden was constituted to do justice in law and equity, with an appeal from his decision to the duke of Cornwall in council only, or for want of a duke of Cornwall, to the crown.

The lord-warden appoints a vice-warden to determine

all stannary disputes every month: he constitutes also four stewards, one for each of the four stannaries, who hold their courts every three weeks, and decide by juries of six persons, with an appeal reserved to the vice-warden, thence to the lord-warden, and thence, finally, to the prince's council.

On this footing the stannary establishment continued till the reign of Henry VII. when Arthur, eldest son to that king, and consequently duke of Cornwall, made certain constitutions relating to the stannaries, which the tanners refused to observe; and indulging themselves in other irregularities inconsistent with their charters, Henry VII. after the death of Arthur, seized their charter as forfeited; but upon their making proper submission, granted them a new charter, by which all their former privileges were restored, and enlarged with this honourable and important addition, that no law relating to the tanners should be enacted without the consent of twenty-four gentlemen tanners, six to be chosen by each of the stannary divisions. This charter was confirmed by another in the twentieth of Elizabeth, when it being found inconvenient that the consent of the whole twenty-four should be required, it was declared, that, at the meeting of every convocation, or parliament of tanners, the consent of sixteen stannators should be sufficient to enact any law. Accordingly, when any more than ordinary difficulties occur, and either new laws for the better regulation of the tanners and their affairs, or a more explicit declaration and enforcement of the old ones becomes necessary, the lord-warden, by commission from the duke of Cornwall, or, if there be no duke, from the crown, issues his precept to the four principal towns of the stannary districts, viz. Launceston, Leitchwithiel, Truro, and Helston. Accordingly each town chooses six members; and the twenty-four so chosen, called stannators, constitute the parliament of tanners.

In the reign of queen Elizabeth, Sir Walter Raleigh being lord-warden, the tanners perceiving, that by the charter of Henry VII. no law could be enacted, unless the whole number of stannators concurred; proposed, that twenty-four other stannators should be chosen, six at each of the tin-courts held at every stannary, and returned by the steward: that these should be added to the former number, in order to make forty-eight members; and that the majority of that number, or as many as should assemble of that number, should be enabled to make laws. This proposal, however, did not take effect; but in the year 1674, some terms and claims insisted upon by the crown, meeting with great opposition, the stannators, who then laboured under great difficulties, named to the then vice-warden six persons for each stannary, and desired they might be summoned by the vice-warden to meet and consult with that convocation. Since that time it is usual, though not absolutely necessary, for every stannator to name an assistant; and these twenty-four assistants form a kind of standing council, and assemble in a different but adjacent apartment, in order to be at hand to inform their principals of the result of calculations, difficulties, and the state of things among the lower class of tanners, which the stannators might not otherwise be so well acquainted with. The stannators, for the more regular dispatch of business, choose their speaker, and present him to the lord-warden to be approved. Whatever is enacted by this body of tanners, must be signed by the stannators, the lord-warden, or, in his absence, the vice-warden, who then presides; and afterwards by the duke of Cornwall, or the sovereign; and when thus passed, has all the authority, with regard to tin-affairs, as an act of the whole legislature.

Such is the constitution and manner of enacting laws in the stannary parliament, which is generally held at Truro; and the many wise regulations that have from time to time been made in this court, have been of the utmost advantage to the miners and proprietors of the soil.

The chief trade of Truro consists in shipping off tin and copper ore, which abounds in the hills between this place and St. Michaels, where many mines have lately been opened, the trade for the ore of that metal having greatly increased since the copper companies of Bristol and Wales were formed.

About the end of the reign of Henry III. a convent of black friars was founded in Kenwyn-street, but there are no remains of the structure now to be seen. And at St. Probus, a little to the north-east of Truro, there was, before the conquest, a college of secular canons, which was given to the church of Exeter by Henry I.

Truro sends two members to parliament, and has enjoyed that privilege ever since the twenty-third year of the reign of Edward I. this being one of the five ancient boroughs of Cornwall. The members are chosen by the corporation, and returned by the mayor.

The markets are held here on Wednesdays and Saturdays; and the fairs, which are principally for the sale of cattle, on Wednesday after Mid-Lent Sunday, Wednesday in Whitfun-week, the nineteenth of November, and the eighteenth of December.

After viewing the ancient borough town of Truro, we returned by water to Falmouth, being desirous of visiting the famous point of land called the Lizard, the farewell cape to most ships going to the southward.

Accordingly we crossed Helford-haven, and in our way visited Kynan's Cave, situated about a mile and a half to the north-west of the Lizard point. The way down to this cave from the adjacent hill, is extremely rough and narrow, the path being only a single track made by the horses which carry sand. From this path you enter a most lonely cave, the sand of which is of a mixed colour, partly blue, and partly glittering. These sands are dispersed in many turning and winding passages, among rocks, and vast masses of the cliff, the foundations of which have been washed away by the sea, and separated from the adjoining high-lands. The sandy walks lead to many grottoes, which are polished too often by the tides to afford any cavernous plants; but at the foot of the rocks, many basins, or baths of crystal water, are formed in the sands by the eddy of the waves. In some places there is sprinkled a soft unctuous incrustation, resembling bees-wax, both to the sight and touch, of which the narrow crevices between the rocks are full. This incrustation does not appear to be an exudation through the pores of the rock, but rather washed out of the crevices, and returned by the waves, till it sticks fast, and forms a kind of enamel upon the sides of the rocks. On the eastern side of this cave, the rocks in general are more gritty and crumbling; and between them some few and small veins of a white and red marbled clay, one species of which is called soap-rock, and by naturalists steatites. It has indeed been said, that all the cliffs near the Lizard consist of this earth; but this is a mistake: some, as we have already observed, is found in Kynan's Cave, and possibly more may, on a more careful search, be discovered in the adjacent cliffs. But the most pure, and, at the same time, the greatest plenty of the steatites is found about a mile farther to the north, where descending into a narrow valley, about two hundred paces from the summit of the hill, we found, on our left hand, a straw-coloured, soft, greasy clay, mixed with a brownish red, and laid bare by the tumbling down of the sod, which originally covered it. This course of clay was about a yard thick, easily cut with a knife, and compressed by the hand. As we walked a few yards farther down, the left hand cliff became a perpendicular solid face of black hard stone, at the foot of which was a channel or vein about eight feet wide, of the soap-rock, of different colours, milk-white, straw-coloured, and veined with green, darkish red and purple. There are also, in this wide course, several stony substances, of no affinity to the steatites. As we came farther down, and nearer to the level of the sea, we observed the vein of steatites, contracted into a course of fourteen inches wide, but of a more uniform consistence, the solid rock making a smooth wall for it on either side. Besides this vein, there are two or three small ones in the side of the cliff.

We have already observed, that there are different kinds of the steatites, or soap-rock, but the white is most sought after. This is a close-grained glossy clay, of a pure white colour, and readily dissolves in water; is tasteless, sticks a little to the tongue, deposits a yellowish purple settlement at the bottom, above which a

cloud of the finest parts continues suspended; mixed with oil, it becomes greasy: 'tis also too fat to make a body of colour for painting in water, and makes no effervescence with aqua-fortis. It is very absorbent, and takes spots out of silk without injuring the colour. This is carefully selected from the other sorts of clay, barrelled up, and almost wholly engrossed by people employed by the managers of the porcelain manufactures.

The principal property of this slip-earth is, that it stands the fire in a wonderful manner; and though, when taken out of its bed, it often appears of different colours, yet the scrapings of almost every kind are white, glossy, transparent, and becomes white in the fire, and even increases in whiteness the longer it is continued there. This is doubtless owing to the different portions of talc and amianthos contained in its composition, which prevents its vitrification, and renders porcelain ware more tough and tenacious.

Having thus carefully viewed the veins of steatites, and the romantic cave of Kynan, we continued our route to the famous headland called the Lizard, from whence there is an unbounded view of the English channel; but nothing remarkable, except the light-houses, erected here for the safety of ships coming in or going out of the channel. These light-houses are built in the form of a cone, and the lantern, or upper part, consists of sash-lights of the best crown-glass; each pane being one foot nine inches and a half high, by one foot five inches and a half wide. On the floor of this lantern is fixed a substantial square iron grate, barred on each side, in which a large coal fire is lighted every night, and a pair of bellows, like those used by smiths, fixed in such a manner, as to blow the fire when wanted. The lantern is covered with a coving canopy roof, in the middle of which there is a large chimney for discharging the smoke. There is a gallery railed in round the lantern, by which the windows are repaired when broken. The whole building is plastered and painted white, which renders these light-houses a useful sea-mark by day, as the light of the fires does by night.

The borough town of Helston is about nine miles from the Lizard Point, and two hundred and ninety-four from London. It is situated on the river Lo, or Cober, near its influx into the sea; and has a tolerable good harbour, where many ships take in their lading of tin.

It is a large and populous place, consisting of four streets, built in the form of a cross, and a stream of limpid water running through each. At the intersection of those streets, stands the market-house, which is a large convenient building. Here is also a guild-hall, where the assembly for the western division of the shire meet. It is also one of the towns appointed for the coining of tin. The church is capacious, and has a steeple ninety feet high, which makes a good sea-mark.

Helston has enjoyed the privilege of sending members to parliament ever since the twenty-third of Edward I. being one of the five ancient boroughs of Cornwall, but was not incorporated till the twenty-seventh of queen Elizabeth, who appointed it to be governed by a mayor, chosen annually on the twenty-ninth of September; four aldermen, who are to be of the common council; and twenty-four assistants. The manor belongs to the prince of Wales, as duke of Cornwall. King John exempted the inhabitants of this place from paying toll any where, but in the city of London, and from being impleaded any where but in their own borough.

Here was formerly a priory and a castle, but few vestiges of either are now to be seen. The priory was dedicated to St. John the Baptist, and endowed, at the dissolution of monasteries, with an annual revenue of twelve pounds sixteen shillings and four-pence.

Helston has a market on Saturday; and seven annual fairs, viz. on the Saturday before Mid-Lent Sunday, Saturday before Palm-Sunday, Whitfun-Monday, the twentieth of July, the ninth of September, the eighteenth of November, and the second Saturday before Christmas day; all for the sale of cattle.

Marazion, or, as it is generally called, Market-Jew, is a small town; about eight miles west of Helston, and two hundred and eighty-four from London. It stands in
a bay

a bay of the sea called Mount's Bay, and has a harbour, very little frequented, being neither safe nor commodious. The place itself is inconsiderable, though it has a small market on Thursday, and two annual fairs for the sale of cattle, viz. on Saturday three weeks before Easter-eve, and on the twenty-ninth of September. In the reign of Henry VIII. this town was burnt by the French.

At Coluvian, a small hamlet, about a mile and a half from Market-Jew, is a chalybeate spring, remarkable for its cures in scrofulous diseases. It is diuretic, and passes off forcibly by perspiration. The bed through which the water flows, is a loose pebbly ground, mixed with a gravelly clay, blended with ochre and iron ore, whence both the taste and smell of the water proceed. It turns of a reddish purple on being mixed with a solution of galls; with green tea, a lighter purple; with oak-leaves, a blue-black, with a purple cast; and with syrup violets, it becomes a deep green. The water in the well is almost blood-warm; and when suffered to rest a considerable time, a film, or skin, of different colours, gathers on its surface.

From Market-Jew we passed over to St. Michael's Mount. This is a pretty high rock, separated by the tide from the main land. At the foot of the rock is a small town, and a pier, where ships may lie in safety. We have given a view of this famous mount on the copper-plate annexed, where the above-mentioned pier is seen. On the summit of the rock is an old castle, once a priory of Benedictine monks, founded by Edward the Confessor; but some time before the year 1085, it was annexed to the abbey of St. Michael's in Normandy, by Robert earl of Merton and Cornwall. After the suppression of alien priories, it was given first to King's College, Cambridge, by Henry VI. and afterwards to Sion Abbey in Middlesex, by Edward IV. At the dissolution of monasteries, it had possessions valued at one hundred and ten pounds twelve shillings and one penny *per annum*.

Being very desirous of viewing the islands of Scilly, so long famous in history, we embarked at St. Michael's Mount, on board a small fishing-vessel, and in twelve hours landed in St. Mary's, the largest of the Scilly islands. In our passage we passed near that famous and dangerous rock called the Wolf, either from its devouring so many vessels as split upon it, or, more probably, from the dreadful howlings which the waves continually make by dashing against it. It lies about eight leagues S. W. by S. of St. Michael's Mount; and nearly in the same tract, at the distance of five leagues from St. Michael's, lies another dangerous cluster of rocks called the Rundlestone.

St. Mary's is not only the largest, but the most populous and best cultivated of all the islands of Scilly. It is three miles long and two broad, contains about six hundred inhabitants, and pays an annual rent of three hundred pounds to the earl of Godolphin, the lord proprietor of these islands.

The old town, formerly the principal place in the island, is situated at the eastern angle of a small cove or creek. Behind the town, which is now decayed, consisting only of a few poor cottages covered with thatch, are the remains of a fortress, called the Old-Town Castle.

But the cove at Old-Town being small, rocky, and exposed to the south winds, the inhabitants removed to another situation, about a mile distant, where there is a large sandy pool, and a neighbouring peninsula, which seems to have been formed by nature for a fortification. The above pool is so very capacious, that an hundred sail of ships may ride safely in it: the anchorage is good, the bottom being soft and oozy. This pool opens into the road where the largest ships may ride. At the west end of the town is a fine pier, finished, in the year 1750, by lord Godolphin, at the expence of eleven hundred pounds. It is four hundred and thirty feet long, twenty feet wide in the narrowest part, twenty-three feet wide at the pier-head, and has sixteen feet depth of water on a spring, and ten feet on a neap-tide. Vessels of one hundred and fifty tons burthen may lie securely in this pier, even close to the quay, or along the strand.

Above the town, on a high piece of land running off into the sea, and termed the Hew, is a small fort called Star-Castle, from its shape. It was built about the year 1593, by Sir Francis Godolphin, who was governor of these islands in the time of queen Elizabeth. The standard is displayed upon the rampart, which is connected by a foss with the governor's house.

A wide terrace is extended from the castle to the barracks, situated at the entrance into the lines, which were originally intended to have been carried entirely round the peninsula. The magazine, in which the arms and military stores are deposited, is situated contiguous to one of the bastions.

Below these lines, the town above-mentioned, called Hew-town from the peninsula, is situated. The principal inhabitants and tradesmen live in this place, and here the custom-house is erected.

Besides the fortifications already mentioned, a fort was begun in the time of Henry VIII. on a hill above the pool; but the impropriety of the situation being soon discovered, it was never finished. We also observed, on all the shores of this island where it was possible for an enemy to land, the remains of block-houses, batteries, with breast-marks reaching from one to the other. These are all modern works, and were probably erected during the civil war of Charles I. There is, however, a very large structure, called the Giant's Castle, which owes its origin to more early times.

It is situated on a promontory, which, towards the sea, exhibits the appearance of a prodigious pile of rocks, heaped on one another. This stupendous pile has also a sharp declivity towards the land, and at the foot of it a ditch crossing a neck of land from sea to sea. Beyond this ditch is a low rampart in the same direction, next a second ditch with a higher rampart; and lastly, near the summit of the crag, a wall of stone encompassing the whole, except where the natural rocks rendered any farther security unnecessary.

Who were the builders of this structure, is now impossible to be known: perhaps it may be imputed to the Danes or Saxons, and was erected during the time of their invasions. The country people, however, will have it, that it was built by the giants, and thence call it the Giant's Castle.

On a rock adjacent to this castle, is an ancient temple of the Druids. The top of the rock is cleared from all protuberances by art, and on the surface the large stones, which form the temple, are placed: it is of an elliptical form, one hundred and seventy-two feet from north to south, and one hundred and thirty-eight from east to west. On the edges of the area are nine vast stones still remaining, together with several others of a smaller size, planted in the periphery of the ellipsis. There is no uniformity in the shape of the stones, nor are they placed at equal distances, as appears from some parts where none of the stones have been removed. One stone on the edge of this temple is seven feet ten inches high above the surface of the rock, and the inner front of it twenty feet long; it is forty feet in girt, and on its surface are thirteen distinct and curious basons sunk into it; and about five paces from it is a rude pillar fallen down. A few paces nearer the center of the ellipsis, is a flat rock, having three basons on its top; and in a right line, on the other side of the center, is another flat rock, with four basons on its top. In the transverse diameter, and about two thirds from the center, towards the south, is a third flat rock, with four basons on its surface; and, in all probability, there was originally a fourth, at the same distance from the center towards the north; so that something of design appears even among this heap of rude stones. What might be the use of these basons, cannot now be known; but doubtless they were subservient to the superstition of the Druids; for the floor of this antique monument sufficiently indicates, that it was once a place consecrated to religious worship, as it could not serve as a sepulchre. Perhaps they were intended to receive and preserve, in their utmost purity, the waters that fall from the heavens, in order to be used in religious rights: this seems the more probable, as not far from the Giant's Castle, and fronting a large groupe of rock-

rock-basins, there stands a prodigious rock, of a thin pyramidal form, twelve feet at the base, and thirty feet high; probably an object of the Druid devotion.

In a cove, called Porthelik, about a mile north-east of the Giant's Castle, the body of that great sea-captain, Sir Cloudesly Shovel, after his shipwreck in the year 1707, was found, naked, and not to be distinguished from the most common sailor; and in the sand, which naturally offered its bosom for a sepulchre, it was interred. The nature of the place would have rendered it doubly inhuman, not to have buried him, whoever he was. Accordingly Horace (Ode 28. Lib. 1.) makes this the first argument to bespeak the same friendly office after a like misfortune.

Stay traveller, and let thy generous breast
Guests the sad tale, and bear my bones to rest:
See where, at hand, these sports of wind and wave,
May find the wish'd for, tho' a sandy grave.

Some time after the body was taken up, and conveyed to Westminster-Abbey; but a small pit on the sandy green still marks the place of his first interment.

The ancient sepulchres are of two kinds, distinguished by the names of Caves and Barrows. Both are very numerous in all the Scilly islands; but the most remarkable of the former is called the Giant's Cave: the mouth of it is four feet six inches wide, thirteen feet eight inches long, and three feet eight inches high. The whole cave is covered, from end to end, with large flat stones, and upon this floor is a tumulus of rubbish. The sheep in the adjacent pasture take shelter in this ancient cave. All the barrows are constructed in the same manner. The outer circles are composed of large stones placed on their ends; and the heap, within this circle, consists of smaller stones mixed with earth and clay. Most of them have a cavity in the center, covered with flat stones, by which the weight of the materials above them is supported. In some the cavity is very small, and in others so large as to compose the principal figure in the whole monument.

At our return from viewing these monuments of antiquity, we visited the church, which is situated near the beach of the cove of Old Town. It is a decent structure, built in the form of a cross, though not so old as the reformation. It has no tower, but at the west end are two covered niches for two bells.

After viewing the island of St. Mary's, we crossed the channel, which is not two miles wide, and landed on the southern point of the island of Trefcaw, called by some writers St. Nicholas's island. It is about a mile and a half long, and a mile broad; contains about forty families, and pays eighty pounds a year rent to the lord proprietor.

The first object that engaged our attention, after landing in Trefcaw, was an old breast-work, of an irregular and uneven plan. It is called Oliver's Battery, but seems to have been the work of a more early age. Not far from this battery, is a most beautiful pool of fresh water, called the Abby-pond. It is near half a mile in length, and a furlong broad, and surrounded with a delightful turf, without either briar, thistle, or flag.

On a gently rising ground, fronting the southern extremity of this pond, stood the Abby-church. The structure is now in ruins, and the greater part of the materials carried off by the peasants, with which they have erected a few mean cottages below it. The door, however, with two handsome and capacious arched openings, and several windows, still remain. They are all cased with free stone like that found in the quarries of Normandy.

The next object we intended to visit was the old castle; but being informed by the persons who accompanied us, that there was a very remarkable stone, about a musket-shot from the castle, we walked to it, and found it to be a large prodigious rock, flat on the surface, and placed a little shelving. The length of it is nineteen feet, and the breadth seven feet six inches. Round this enormous stone is a trench edged with a bank composed of smaller stones, thirty-six feet in diameter; but whether it was originally an altar, or one of the rock deities of the ancient Druids, cannot now be known.

The old castle, now in ruins, was once a large pile of building, but very badly situated to answer the intention. From the square form of the doors, &c. it does not seem to be older than Henry VIII. We have already said, that the situation of this castle was badly chosen, the steep craggy hill on which it stands being alone a sufficient defence against any enemy's landing thereabouts; and there could be little danger on the land-side, where the lines of a fortification, regularly divided into curtain and bastions, are still remaining. The impropriety of this situation, however, seems to have been soon perceived, as this was suffered to decay, and another, nearer the water's edge, was erected out of its ruins.

This fort, which is now known by the name of Oliver's Castle, stands on the eastern point of the entrance into the harbour of New Grynsey. The principal battery is only a few feet above the water's edge, so that, with guns of nine pounders, it commands entirely the mouth of that harbour. Within this battery is a round tower, on the top of which is a battery of four pounders. The ensign staff is fixed in the side of the parapet, which is about six feet high.

The church here, as in all these little islands, is small, being only twenty-seven feet long, and fourteen wide; and seems to have been erected since the reformation. The inhabitants, however, from a notion of the superior sanctity of the abbey, bury all their dead in that church.

On this island we saw the vestiges of an ancient tin-mine, the only work of this kind, as our companions informed us, now remaining in all the Scilly islands.

Here we saw the inhabitants busied in making kelp, a kind of salt dross, which they export to Bristol, and other places where there are glass-houses, kelp being a principal ingredient in making glass: it is also used in the manufactures of soap and alum.

Kelp is made from the ashes of dry ore-weed, which grows in great plenty on the rocks surrounding these islands, and principally in the months of June and July; for after that time they think it wrong to cut any more ore-weed, but let it grow till the subsequent year.

Each island has its proper limits assigned for gathering the ore-weed, nor will they suffer any to cut it beyond his own proper bounds. They go off in their boats, sometimes to a considerable distance, and at low water cut the weed, &c. from the rocks with hooks, load their boats, and return with the tide. As soon as they land with their cargo, they spread it thin upon the beach to dry, where they turn it often; and when dry, if the weather is likely to prove wet, they cock the ore in the same manner as hay, but in much smaller heaps.

When the ore is thus prepared, they form a circular shelving-pit in the sand seven feet diameter, and three feet deep, lining the sides of the pit with stones, that while they are stirring the ore-weed, no earth or sand may mix with the kelp, which would greatly reduce its value. The pit being thus finished, they place a small bush of furze, lighted, at the bottom, and throw on very lightly some of the driest ore-weed. As the fire gains strength, they feed it with fresh ore; and when a sufficient quantity is laid on, and the fire very strong, the whole has the appearance of bright glowing embers. When it is in this state, they mix and stir it with iron rakes, from one side of the pit to the other, till it begins to run, and an imperfect kind of vitrification ensues; and when the whole mass is melted, they suffer it to rest, by which means it consolidates into a large lump at the bottom of the pit, as in a mould; and when cold, it is taken out, broken into proper lumps, and packed into casks for exportation.

Great quantities of kelp are made in these islands; and we were assured, that in the year 1751, the whole value of the kelp exported from hence amounted to five hundred pounds.

As there is nothing particular in the rest of these islands, except a light-house in the island of St. Agnes, we shall not trouble the reader with a description of them; but it may not be improper to observe, that the island of Scilly, from which the whole clustre takes its name, is a small island composed wholly of cliffs and rocks, whose barrenness will not suffer any animal, except birds, to inhabit

inhabit them. It forms the S. W. promontory of these islands, and from its great height, is generally the first land seen by ships coming from the southward.

The Scilly islands were doubtless much better inhabited in early times than they are at present, the whole number of inhabitants now on all the islands not amounting to more than twelve hundred. There is also great reason to think they were formerly much larger than at present, vast tracts of land having been swallowed up by the sea, as plainly appears from hedges of stone, and other ruins visible on the sands at low water, and upon which, at full sea, there are twelve feet of water. And as these lands were every where so well inclosed, and carefully divided, the islands must have been well peopled; and if they were well peopled, they must have had towns and villages, and these towns must have been in the lowlands, for the ruins in the higher are not sufficient to afford accommodation for great numbers. These islands, therefore, are greatly sunk from what they were in ancient times; their towns and lowlands are swallowed up by the ocean, and what remains can never reach their ancient improvement. But they should not, even in their present state, be neglected, as they are of the greatest importance to the trade of England, both in peace and war. Many things, indeed, which the present age considers as necessary, are here wanting; but the inhabitants, who are strangers to the modern luxury, want nothing either for their defence, their subsistence, or the means of procuring every thing necessary to render life agreeable and happy. Though, in all probability, they can never equal the inhabitants of these islands in remote times, yet they are greatly superior to what they were some ages ago; their country, as well as their condition, have been daily improving ever since these islands have been in the hands of the Godolphin family, who are still the worthy possessors.

The present inhabitants of these islands employ themselves in husbandry, fishing, and making kelp. Their situation for the first is extremely good, from their inhabiting such little islands, where the sea-sand, and the ore-weed, together with the manure from their cattle, with a soil good for every species of grain, except wheat, some of which, however, is cultivated in St. Mary's, and plenty of stones for fences, afford the greatest encouragement to industry.

But the want of mills is a great disadvantage. There is but one grist-mill in all the islands; and this moved by the wind; so that in long calms, and other necessary deficiencies, the inhabitants are obliged to grind their corn in hand-mills at home, a convenience which almost every house is furnished with. But should a storm happen between the time the blade appears, and the harvest, great damage is done to the crop, the salt spray of the sea being driven with such violence, that it breaks and burns up every thing that is tender.

They have roots of all kinds, as turnips, carrots, potatoes, &c. together with pulse and sallads. Dwarf fruit-trees also, such as gooseberries, currants, raspberries, and all other shrubs which do not rise above the hedges, flourish here.

Husbandry is not, however, the sole employment of the inhabitants; great part of their time is spent in fishing. They catch mackrel in great plenty during their season: they also take great quantities of excellent turbot, sole, plaice, and ling; the last they cure with salt, and send it dried to many parts of England. They have also some salmon, salmon-pele, cod, pollock, and other fish, particularly pilchards, which come into their coves some time before they reach the bays of Cornwall, and might be taken in prodigious quantities, cured, and sent to market, sooner than those taken by the Cornishmen. But this advantage is totally neglected, and only a few caught to supply the wants of the inhabitants.

The air of these islands is, in general, healthy, being constantly fanned by the sea-breezes, rising from every quarter, and uninfected by any large tracts of marshy grounds; but sea-fogs are more common here than where there are large tracts of land. In the months of June and July, when they burn their ore-weed for making kelp, the air is filled with a heavy disagreeable vapour,

which is not soon dispersed. During the summer, the air is very hot, occasioned by the large tracts of sand; and in the winter, the sand is blown up from the caves in such clouds, as renders walking abroad very disagreeable.

The water from the wells, in several of these islands, is very good, for they have no running water, except after great floods.

They have most of the useful birds known in England, particularly a small bird, not bigger than a lark, of an ash-colour, called a hedge-chicker, and thought by many not inferior to the ortolan. Every species of tame poultry they have here in great perfection. Sea-birds, especially puffins, are very numerous; they build among the rocks, and are of a fishy taste.

Their black cattle are, in general, small. Ore-weed is great part of their food; and such as have been used to it will not thrive, unless they have liberty to resort to the sea shore, and feed upon that vegetable.

Their horses are small, but lively, and fit for labour, their sheep, though not large, are extremely valuable, and their flesh of a fine taste. They will feed upon the ore-weed, as well as the bullocks.

There is neither viper, nor any other venomous creature, to be found in these islands. They have, however, a species of very troublesome fly, though not poisonous. They hide themselves during the day-time, but come forth in swarms by night, spreading themselves over the kitchen, pantry, &c. and devouring every eatable that comes in their way. This fly is called a cock-roche, and has four wings of a brown tortoise-shell colour. It is an American fly, and supposed to have been brought into Scilly, by opening a surgeon's chest in one of those islands.

All the ancient historians inform us, that these islands were once very famous for their tin; and Strabo tells us, that the master of a Phœnician vessel bound hither, perceiving he was followed by a Roman, ran his ship ashore, chusing rather to risk his life, ship and cargo, than admit a partner in this traffic, by shewing him the way to these islands. The Romans, however, by persisting in their resolution, at last accomplished their design. But there are now no tin-mines in these islands; they are therefore swallowed up by the sea, unless we suppose that the inhabitants had their tin from Cornwall; or that the ancients included that county in the general name of Cassiterides, an appellation they gave to the islands of Scilly.

Before we conclude our account of the Scilly islands, we must observe, that they were the last retreat of the royal party, in the late civil war. But Cromwell knew too well the value of these islands, to let them remain in any other hands; and accordingly admiral Blake and Sir George Aske were dispatched, at the head of a body of troops, to reduce them. They landed in Trefcaw without much opposition, the king's party retiring by night to St. Mary's, where there were at that time a thousand men more, and among them a great number of officers.

The royal party being thus retired from Trefcaw, the enemy made use of the old breast-work we have described in our account of that island, in order to erect an advanced battery that might command the road at St. Mary's. This battery covered their camp, which lay on a low neck of land about a mile to the north, and, at the same time, could effectually annoy all ships coming in or going out of St. Mary's; for when the winds or tides are any thing violent, the ships must either run upon the rocks, or come very near this battery.

In consequence of this skilful disposition of the parliament's forces, the king's party were so much distressed, that one Mr. Philips was sent, with an account of their situation, to the prince, then in Holland, and the cavaliers had leave to surrender upon the best terms they could procure. Accordingly eight hundred soldiers, together with officers sufficient to head an army, surrendered themselves on terms of capitulation.

These islands, with regard to ecclesiastical jurisdiction, are subject to the bishop of Exeter, as they were, before the see was translated to Exeter, to the bishop of Cornwall.

The present inhabitants of the Scilly islands are very civil to strangers, and remarkable for speaking good

English. The men, though at other times employed about husbandry, spend part of the year in boats and fishing, which renders them active and hardy; and being also much used to fowling in the winter, are good marksmen, and therefore would soon make excellent soldiers or sailors: And it is necessary to be remembered, that the security of these islands must chiefly depend upon the spirit and docility of the inhabitants; for their other defences are rather imaginary than real, the garrison consisting only of about forty invalids; and with regard to the difficulties of finding the way into these harbours, they are not so great as they appear at first sight: a little experience will be sufficient to surmount the difficulties, and pilots are not impossible to be procured.

The situation of these islands renders them of great advantage to shipping in general bound from the coast of England to the southward, but of peculiar benefit to all the channel traders passing between the English and St. George's channel; for being situated nine leagues to the westward of the Land's-End, the ships going from one of these channels to the other, must pass near Scilly; and if they are taken with a contrary wind, which is very often the case, they generally chuse to bear away for Scilly, as a place from which they can clear the headlands of England as soon as the wind changes. Accordingly they are greatly frequented, it being not uncommon to see seventy or eighty sail of ships in the pier and road of St. Mary's.

The inhabitants, who make it their business to pilot ships into these harbours and sounds, are very alert in their profession. As soon as any ships appear in the offing, they go out, ten or twelve together in one boat, and steering up along-side, one of them jumps on board the ship, and the boat proceeds to another, and a second pilot leaps into her, then to a third, &c. till there are only two men left in the boat, which then returns to the nearest creek, it being often impossible for the two men to bring her back to the place from whence she sailed. A stranger cannot behold this piece of dexterity without being in pain for the consequence; but custom has rendered it so familiar, that very few accidents happen.

But however useful the islands of Scilly may be to navigation in times of peace, they are still more so in war; for were they ever to fall into the hands of an enemy, the channel trade from Ireland, Liverpool, Wales and Bristol, to London, and the southern parts of England, could not subsist. For Scilly lying off the Land's-End of England, and looking into both channels, no ship could pass without being visited by privateers from some of these roads or harbours.

Accordingly, queen Elizabeth was so sensible of their importance, when at war with the Spaniards, the most powerful nation by sea then in the known world, that she ordered, and encouraged Sir Francis Godolphin, lord lieutenant of Cornwall, to improve and strengthen these islands. Accordingly Star-Castle, on the island of St. Mary's, was begun and finished in 1593: a curtain and bastions, on the same hill, were also erected, and others begun. By this means the harbour and pool, just below the castle, were pretty well defended. As soon as the castle was built and garrisoned, houses were erected below the lines on the edge of the pool, and inhabitants encouraged to settle there, as the place was very convenient for sheltering ships bound into either of the channels, and at the same time commodious for fishing, secure from pirates, and national enemies, and had plenty of both ore-wood and sea-sand for the improvement of the soil. This had the desired effect, and the islands of Scilly have, ever since that period, been continually increasing.

While the islands were in the hands of the royal party, during the latter end of the civil war, the parliament ministry fully experienced the consequence; for Whitlock tells us, that continual complaints were made to the managers of affairs at London, of the daily capture of ships by the privateers of Scilly. And this gave occasion for sending admiral Blake and Sir George Askue to dislodge the cavaliers from a post which gave them such opportunities of distressing the trade of England. At the same time, the Dutch were very desirous of being masters of these islands; tho' all their schemes, both for conquest

and purchase, became abortive. But the very attempt should teach us to set a proper value on the Scilly islands; and never suffer them to fall into an enemy's hand.

Having surveyed the islands of Scilly, and remarked every thing that seemed to merit attention, we returned back to St. Michael's Mount, but had not so good a passage as in our visit to these islands. The wind, which was fair, and blew an easy gale, when we left St. Mary's pier, died away when we were about the middle of the channel; where we continued during the whole night. When the morning appeared, the wind again sprung up; but before we reached Mount's Bay, blew so very hard, that it was with the utmost difficulty we reached the pier at St. Michael's Mount.

After refreshing ourselves a few days at the village on the strand of the Mount, we crossed over the sands to Market-Jew; for it should be observed, that the sands are dry at low water, on a spring-tide; so that St. Michael's is alternately an island, and a promontory joined to Cornwall by an isthmus of sand.

Penzance was the next place we visited in Cornwall. It is a market-town situated at the bottom of Mount's-Bay; two hundred and ninety miles from London. In 1595, it was burnt by the Spaniards, who, with four galleys, surprized this part of the coast, and set several villages and farms on fire. Penzance was, however, soon after rebuilt, and made one of the coinage towns. It is now a populous place, with a good trade, and has many ships belonging to it. This part of the coast abounds so much with lead, tin, and copper ore, that the veins of metal are visible to the utmost extent of the land at low water.

Penzance has a well frequented market on Thursday, and two annual fairs, viz. Thursday after Trinity Sunday, and Thursday before Advent Sunday, both for the sale of cattle.

In this parish, not far from Penzance, is St. Madern's Well, famous for its cures, particularly for lamenesses, and scrofulous disorders. It is of the chalybeate kind; and we were assured, that several persons had lately received very great benefit from drinking the waters. We could not indeed perceive that they were warmer than that of other springs, but the mineral taste was very perceptible.

At a little distance from this well, is a famous stone monument of the ancient Druids. It consists of three stones standing erect, and forming a triangle. One of these stones is thin and flat, and fixed in the ground on its edge: in the middle of it is a large hole, about fourteen inches diameter, and from thence is called Men an Tol, which, in the Cornish language, signifies, the holed stone. The other two stones are rude pillars, about four feet high; and near one of them is a stone, lying like a cushion or pillow, as if to kneel upon. It is not easy to determine the particular rite or ceremony to which this monument was appropriated; but the country people in the neighbourhood, even to this day, creep through the holed stone, when afflicted with pains in their backs and limbs. Young children also are drawn through it, as a cure for the rickets. At the same time, it likewise serves as an oracular monument, to inform them of some material incident they are desirous of knowing, either with regard to love or fortune. There are several of these kinds of monuments in this county, as well as many rocks of such amazing dimensions, remarkable shape, and surprizing positions, as leave no room to doubt of their being once the deities of the Druids, who were greatly addicted to the superstition of worshipping rocks.

The great road from London to the Land's-End lies through Penzance. We proposed to follow this road to view that remarkable promontory; but soon after our leaving the town, we turned off to the left, in order to inspect a stone monument, which, we were informed, was at Kerris, in the parish of St. Paul. It is an oval inclosure, called the Roundago, which is about fifty-two paces from north to south, and thirty-four from east to west. At the southern extremity stand four rude stone pillars, about eight feet high, at the foot of which lie some large stones, supposed to have formerly rested on these pillars.

Having satisfied our curiosity with regard to this antique monument, we continued our route to the sea-side, where there is a small village called Karn Boscawen, about five miles from Penzance. Here we saw another ancient monument, consisting of a large flat stone, one end of which rests upon the natural rock, and the other on three large stones, which form a firm and proper support for the weight of the horizontal stone. Between this canopy and its supporters, there is an opening seven feet wide at the top, but closing gradually into an acute angle at the bottom. The top-stone is too nicely supported to be the work of nature; and the opening underneath it is supposed to have been designed for the seat of some chief-priest among the Druids, from whence he might issue his edicts and decisions, his predictions, and admissions to noviciates; and indeed the mind can hardly form to itself a scene more striking and awful than this, which consists of vast rocks on either side above and below, fronting an immense ocean.

From Karn Boscawen we proceeded to Castle-Treyn, in order to view the famous logan, or rocking-stone, placed here. It is situated on a remarkable promontory, about three miles to the east of the Land's-End, and consists of three distinct piles of rocks. On the western side of the middle pile, near the top, lies a very large stone, so evenly poised, that any person may rock it; and yet the extremities of its base are at such a distance from each other, and so well secured, that it is impossible for any lever, however applied, to remove it from its present situation.

From this monument of antiquity, we proceeded along the coast to that remarkable promontory called the Land's End; and in our way, observed great numbers of birds, called the Cornish cough, the *pyrrhocorax* of authors. It is about the size of a jack-daw; its legs, toes, and bill, are of a strong vermilion colour; and the bony substance of these parts clear even to transparency. They are always yellow when the bird is young, and in the hen yellower than in the cock; but as they advance in age, the yellow changes gradually into a red. Its feathers are of a much richer velvet black than those of any other crow. It shrieks very loud at the approach of any thing strange or frightful; but when it applies for meat, its chatter is extremely soft and engaging, making its court to those who usually give it food. Its strength lies in its bill and neck rather than in its wings, and therefore not so warlike in the air as other crows; but on the ground it is very quarrelsome, whetting and darting its bill, not suffering any stranger to touch it, however tame. Very apprehensive of danger, it builds its nests in the cliffs, but neither at the top, as if its fears were only from below; nor at the bottom, as if all its fears were from above; but in the middle of the steepest precipice. It is very amusing when kept tame, docile, regular, and constant to its hour for meat; early at roost; in bad weather fond of shelter, and seldom seen; but when the weather is fine, it enjoys the air on the tops of houses; if tame; if wild, strutting stately along the hills by the sea-side. It seems delighted with any thing that has a glittering appearance, very agile, and meddling; and therefore not to be trusted alone, where fire, money, or papers of consequence lie, though not near so mischievous as the jack-daw. It is a great enemy to houses covered with thatch, dispersing the moist and rotten parts by its long bill in searching for worms: it will also pick out the lime pointing of walls, in searching for spiders and flies. We shall conclude this account of the Cornish cough with observing, that it is the most graceful, slender, and genteel bird, of the crow kind.

We also found among the rocks, at low water, that species of the buccinum which yields the beautiful purple, so greatly extolled by the ancients. It is a small shell fish of the snail kind; the shells are of various tincts, but most of them of a sandy colour. The colouring matter is contained in a small cist or bag, which appears like a part of the intestines; and when first extracted, is of a greenish colour; but if linen be wet with this fluid, the marks of it will, in a day or two, appear of a pale reddish colour; and when washed for the first time, is heightened into a palish purple;

every washing after exalts the colour, till it becomes strong and vivid; nor is it ever subject to fade or decay.

There are also found in these sands great quantities of the razor, cutler, or sheath-fish. This fish, which inhabits a cylindrical shell, resembling the round sheath of a knife, keeps itself always perpendicularly sunk in the sand, but in such a manner, that its head is constantly uppermost: its head is distinguishable, not by its figure, but by two tubes, which receive and eject water, necessary for its respiration. The lower part of the sheath-fish is that which serves for its progressive or perpendicular motion: this motion is confined to a foot and a half, or two feet perpendicular height, and is effected by means of a leg which is protruded from its shell. Having a power of varying the shape of the extremity of this leg, so as to make it somewhat pointed, in order to penetrate through the sand, or to swell it into the figure of a bowl, in order to increase the surface, and consequently the resistance from the sand, it can sink down or raise itself up, till the inferior part of the shell is even with the surface of the sand.

It is easy to make the sheath-fish perform these two motions; for when the tide is out, and has left the hole, where it lodges, bare, you need only throw into it a little salt, and the sheath-fish will immediately rise half out of the sand, and is then easily taken; but if you would see him sink back into his hole, the least touch will be sufficient, for he will immediately sink back below the sand; nor will any quantity of salt thrown into his hole, be sufficient to make him rise a second time. The fishermen in Cornwall, however, take these fish without the assistance of salt, by means of a small kind of spade; for the fish, unless disturbed, lying near the surface of the sand, they throw him out with great facility. Care must however be taken to approach the hole with great caution, that the fish may apprehend no danger; for if once disturbed, he sinks immediately beyond the reach of the spade.

Another singular species of bivalve shell-fish common among the rocks on this coast, is called the Pholis. This creature is destined to live its whole life in a hole in the rock, which it makes for its abode. This hole, by which it enters the stone, is at first very small, often not above the tenth part of an inch; but from this small aperture it keeps incessantly boring its way into the stone, till it has entered twelve or eighteen inches within the surface, and the fish is three or four inches long, and near an inch thick. The shell seems to be the instrument by which it excavates the stone, for the fore part of it on each side is armed with several sharp-edged protuberances like those of a rasp; at the same time the figure of the hole is exactly similar to that of the shell, and so nearly equal to it, that there is very little room for it to open. At the hinder part of the fish is a round fleshy substance often protruded from the shell, and about two inches long. This part has been called the proboscis of the fish, and considered as the instrument by which the cavity in the stone is formed. It is very singular, that though great numbers of these fish are often found in the same stone, yet they never infringe upon each other's cells, though the partitions are sometimes not more than a line in thickness.

We next surveyed that famous promontory called the Land's End, remarkable, as being the most westerly point of this kingdom; but has nothing besides, except its lofty cliffs, to recommend it to the observation of a traveller. There is a small place in the neighbourhood, called Senan, three hundred miles from London. Near it are several tin-works, which render the country full of people.

About a mile from the Land's-End, and between that and Cape Cornwall, is a remarkable cove, called Ponnanon. Under the clay and rubble which form the upper part of the cliff, are ranged horizontally many rows of large and small roundish pebbles of the granite kind. The covering of this pebbly stratum is fifty feet deep at the north end, but only twenty on the south, consisting of a rough yellow clay, charged here and there with large and small stones, all with thin angles on; whereas those of the same size and texture strewed on the

the strand below, are round; owing, in all probability, to their being tossed to and fro by the force of the tide. On examining the interstices of this pebbly stratum, we found many small black flatty stones, with their angles smoothed off, and between them sand of different kinds at different levels. This sand, though now fifteen feet higher than the full sea-mark, has every evidence that can be expected of its having come from the sea, and afterwards covered with a load of rubbish, from twenty to fifty feet deep.

Near the church of St. Just, and about a mile and a half from the above cove, is a remarkable ancient amphitheatre; and by the remains of it, seems to have been a work of more than usual labour and correctness. It was an exact circle of one hundred and twenty-six feet in diameter, inclosed with a bank, round which are benches of stone. The perpendicular height of the bank from the area within, is not seven feet, but the height from the bottom of the ditch without, ten feet. The seats consist of six steps, fourteen inches wide, and a foot high, with one on the top of all, where the rampart is about seven feet wide.

There are, in several parts of Britain, many theatres of this kind, and some that are semicircular. The latter form are doubtless best adapted to the instruction and information of the audience; yet, as they cannot be supposed, in these illiterate times, to have consulted the delight and instruction of the ear, so much as the pleasure and entertainment of the eye, it is not so commonly met with among the remains of antiquity as the amphitheatrical form, which being more capacious, was generally preferred to the former. In these amphitheatres the ancient Britons usually assembled to hear plays, and see sports and games. Here they also performed all their athletic exercises, for which the Cornish Britons are still remarkable; and when any single combat was to be fought on foot, no place was thought so proper as these inclosed circles.

From St. Just we pursued our tour to Lanyon, a village about three miles from St. Just, where there is a famous antique monument called a Cromlech. This sort of monument, of which there are many in various parts of England, Wales, Ireland, &c. consists of a large flat stone, placed in a horizontal position, and supported by other flat stones fixed in the ground. The situation generally chosen for this monument is the summit of a hill, doubtless in order to render it as conspicuous as possible. Sometimes it is mounted on a barrow or mound of earth; sometimes placed in the middle of a circle of erect stones, in which case it is supposed to have been erected on some extraordinary occasion; especially when the circle has a tall stone in the middle, the cromlech is placed in the periphery: the elevation of it is generally six, eight or more feet from the ground, though some are found quite inclosed, and, as it were, buried in the barrow. There are rarely more than three supporters to this monument, and these inclose an area of about six feet in length, and four in width.

The cromlech we visited at Lanyon, is placed on a bank of earth not two feet higher than the adjacent soil, but twenty feet wide, and seventy feet long, running north and south. The upper, or cover stone, is forty-seven feet in girt, nineteen feet long; and in some places two feet thick, and so high above the ground, that a man on horseback may stand under it.

At Molfra, about a mile from Lanyon, is another cromlech, placed on the summit of a round hill: the cover stone measures eight feet nine inches by fourteen feet three inches: the supporters, which are three in number, are five feet high, and the length of the incumbent stone placed east and west. It was evidently brought from a karn or ledge of rocks, about a furlong to the north-west, where there are several very large flat stones lying horizontally over one another. The stone barrow with which this cromlech is surrounded, is not above two feet high, but thirty-seven feet three inches in diameter.

The use and intention of these monuments appear to have been sepulchral, as is evident from several circum-

stances, particularly from the skeleton of a human body, together with several pieces of bones lately dug up under a monument of this kind in Ireland.

Having viewed these monuments of antiquity, we passed on to St. Ives, a borough town situated on the Irish sea, two hundred and seventy-eight miles from London. It sends two members to parliament, and has enjoyed that privilege ever since the first year of queen Mary. It is governed by a mayor, twelve capital, and twenty-four inferior burgesies, a recorder, town-clerk, &c. St. Ives has a harbour on the Irish sea, but is now almost choaked up with sand, the whole coast from this town to the Land's-End being a long tract of sand-banks, so that the inhabitants have been more than once obliged to clean their harbour. The town is now but little frequented, having decreased with its trade, which the badness of the harbour has greatly injured. The church, however, which is a chapel of ease to the parish of Unilant, is large and handsome, but stands so near the sea, that the waves often dash against its walls; a proof that the ocean has made here large encroachments on the land, even within a few centuries; for it cannot be supposed the church was erected so near the water. There is likewise a free grammar-school founded here by king Charles I. of which the bishop of Exeter, and the mayor and burgeses, are governors. The bay, in which this town stands, and thence called St. Ives Bay, is greatly exposed to the north and north-west winds, which have thrown such quantities of sand into it, that it is almost useless to ships of any burden. The Heyl falls into the bottom of this bay, and was formerly navigable much higher than at present, as we have already observed in describing that river. The land between the bottom of St. Ives Bay, and that of Mount's Bay, is not above three miles over, and the town of St. Ives so situated, that neither the British nor St. George's Channel are at any great distance. At the same time the islands of Scilly may be seen from the top of the adjacent hill, in a clear day. A very considerable trade was carried on here before the harbour was ruined by the sand; and twenty or thirty ships of considerable burden belonged to St. Ives; but at present the principal trade consists in pilchards, and the exportation of Cornish slate. Many vessels, however, still frequent this place, loaded with coals from the coast of Wales, for the use of the tin mines in its neighbourhood, and carry back copper-ore.

Here are two weekly markets held on Wednesdays and Fridays; and one annual fair kept on the Saturday before Advent-Sunday, for the sale of cattle.

On the top of the hill above-mentioned, from whence the islands of Scilly may be seen, is a very handsome cromlech: the top-stone is of the same dimensions with that above described at Molfra, and seems to have been brought from the same karn. The top-stone also points the same way, viz. east and west, and is eight feet ten inches from the ground. Beneath it is a stone chest, neatly formed, and fenced every way. The whole is surrounded by a stone barrow, forty-seven feet in diameter.

There are still great numbers of these artificial mounds or barrows in many parts of Cornwall; they are monuments of the remotest antiquity, and often of the highest dignity. They were originally intended for the more secure protection of the remains of the dead, and introduced by the practice of the Druids, who first burnt their dead, and then buried the ashes; though afterwards many were raised for other purposes. The materials of which barrows consist, are either a multitude of small and large stones, earth alone, or stones and earth mixed together, and forming a little hill or mound, called by the Romans Tumulus.

An earthen barrow of a wide circumference, and about five feet high, situated in a field at Trelowarren, not far from Helton, was opened in July 1751. When the workmen had dug half way to the bottom, they found a parcel of stones placed in some order, which being removed, a cavity was discovered in the very center of the barrow, about two feet in diameter, and the same in height. It was surrounded and covered with stones, and contained human bones of different sorts, intermixed with wood-ashes. At the distance of a few feet from

from this central cavity, there were found two urns, one on each side, with their mouths downwards, and filled with small bones and ashes. Among the earth of the barrow were found three thin pieces of brass, supposed to have been fragments of a sword, or some other instrument, which, after being placed on the funeral pile, was broke and thrown into the barrow, among the earth and other materials that were heaped together.

Some barrows discover greater art and exactness than that we have just described. Many are surrounded with a single row of stones, which form the base, and thence called stone barrows; others are surrounded with a ring or fofs of earth: some have a large flat stone on the top, now and then with, but oftener without any inscription. Some have a circle round the bottom, and another round the top; and where this custom prevailed, and no stones offered, trees were planted. When these barrows were not very large, and the burial-places of private persons only, they were situated near the public roads, to put travellers in mind of their own destiny. If they were the sepulchres of common soldiers, they were generally thrown up on the field of battle where the soldiers fell. These are always found in straight lines, stretched along the plains which have been the scenes of great actions, as regularly as the front of an army. The size also of these sepulchral monuments is various, but generally large in proportion to the quality of the deceased, or the vanity, affectation, and power of the survivors.

But though the principal cause of the erection of these barrows was to inclose either the ashes or bodies of the dead, they were afterwards applied to the solemnization of great actions, from that kind of veneration the ancients always paid to the sepulchres of the dead. Accordingly the Druids kindled their annual fires on the large flat stone found on the tops of many barrows. Where the earthen barrows are inclosed by a circle of erect stones, they are supposed to have served as altars for sacrifices. They were also probably used at times of inauguration, the prince elect standing on the top exposed to the view of all the people assembled together, and the Druid officiating close to the edge below. Judgment was also frequently pronounced from the same hillock, and the most important causes decided on the same sacred eminence.

We crossed the river Heyl, landing at a village called Philac, where vessels of a hundred tons may safely ride; and continued our journey to Redruth, a populous town situated among the tin-mines, two hundred and seventy-three miles from London. It has three annual fairs for the sale of cattle, &c. the first on the second of May, the second on the fifth of September, and the third on the first of October.

From Redruth we continued our journey, along the large road, to the borough town of St. Michael's, two hundred and sixty-one miles from London. This place has enjoyed the privilege of sending members to parliament ever since the latter end of the reign of Edward VI. It is governed by a portreve chosen annually by a jury of the chief inhabitants, out of the six chief tenants, called deputy lords of the manor, because they hold lands in the borough. It was formerly called Modishole, and has been tainted by a vulgar error, and its name changed to that of Michael. It was of considerable note in the Saxon times, but is now dwindled to a mean hamlet, to the parishes of Newland and St. Enidore, not consisting of more than thirty houses, inhabited by poor people, who have neither trade nor privilege, except that of sending two members to parliament. St. Michael's has no market, but two annual fairs, the first on the Monday after Michaelmas, and the second on the eighth of November.

About eight miles from St. Michael's is a famous spring, called Holywell. It is situated in a small sandy bay, where there are several caves wrought into the cliff by the sea. In one of these caves, at the north-east point of the bay, and at the foot of a high cliff, the well is found. The entrance is low, but by the help of some steps cut in the rock, you ascend about fifteen feet perpendicular, where the water, which distills from every part of the roof, is collected into a little basin, from

which proceeds a small rill about the bigness of a reed. Some short stalactites hang from the roof; and the floor of the rock, on which you tread, is covered with the same substance. The water is much commended in fluxes, and other disorders of the bowels; but we could not discover it contained any mineral properties, though we made several experiments for that purpose.

St. Columb is a small market town situated on a little river which falls into the sea at Port Glevan, two hundred and forty miles from London. It has its name from the church, which stands in the town, and is dedicated to St. Columba. The place is inconsiderable, though the justices of the southern division keep their sessions, and hold a court here once in three weeks, for determining all actions under forty shillings. It has a market on Thursday, and two annual fairs, held on the Thursday after the thirteenth of November, and the Thursday after Mid-Lent Sunday, both for the sale of cattle. Near the town is a hill, with a fortification on its summit, and a causeway leading to it, and was originally a Danish encampment.

About eight miles from St. Columb, lies the town of Padstow, called originally Petrock-Stow, from Petrocus, a British hermit, who resided here in his cell. It stands at the mouth of the Camel, in the Bristol channel, very convenient for carrying on a much greater trade with Ireland, Wales and Bristol, than there is at present, though it is now pretty considerable. But the harbour, though the best on the northern coast of Cornwall, and capable of receiving a considerable fleet of large ships, cannot be entered without great danger, except by a skilful pilot, as there is a ledge of rocks on the east side, and a shifting bar of sand on the west. The principal trade of this place, besides that already mentioned, consists in exporting slate, and the herring fishery, which come up the channel in October. Here is a market on Saturday, pretty well frequented; and two annual fairs for the sale of cattle, &c. on the eighteenth of April, and the twenty-first of September.

From Padstow we went up the Camel to Wadebridge, a structure already described in our account of that river. The place is small, but has three annual fairs for the sale of cattle, viz. the twelfth of May, the twenty-second of June, and the tenth of October.

From Wade-bridge we pursued our journey to Bodmyn, one of the ancient boroughs of Cornwall, two hundred and sixty-three miles from London. It is situated near the center of the county, and between two hills, which renders it less healthy than almost any other part of the county. It is governed by a mayor, twelve aldermen, twenty-four common council, and a town-clerk. The corporation are possessed of a toll and lands to the value of near two hundred pounds *per annum*.

Bodmyn consists principally of one street near a mile long, running from east to west, and containing about three hundred houses. The hill on the south side intercepts effectually the sun, as well as the current of the air; and the back buildings consist principally of kitchens, stables, and other buildings of that kind; and being built on the declivity of a hill, are ascended by steps, so that the filth is, by every shower of rain, washed down through the houses into the street.

The hill on the north side is not so steep, and therefore is not so very inconvenient to the houses; but the water which supplies the town is carried in an open trench through the church-yard, the common burying-place for both the town and parish.

The church is the largest in the whole county, and had once a lofty spire, which was destroyed by lightning in the year 1699. A church near this spot was originally built to the memory of St. Petrocus, and the episcopal see of Cornwall was placed here by king Edward the elder, about the year 905; and about the year 926, king Ethelstan is said to have met with old Saxon, or rather British monks, following the rule of St. Benedict, to whom he granted such great privileges and endowments, that he is considered as the founder of the monastery, the remains of which are still to be seen, together with those of the episcopal palace. About the year 1120, one Algar re-established this monastery, placing in it regular canons

of the order of St. Augustine, who continued till the general suppression of religious houses in the reign of Henry VIII. when this monastery was filed the priory of St. Mary and St. Petroc, and valued at two hundred and seventy pounds and eleven-pence *per annum*.

Besides the above ruins, there are many vestiges of large buildings, which abundantly shew it was once of much greater consequence than at present; and indeed, so lately as the time of Henry VIII. it was considered as the largest town in the county: it was also formerly one of the coinage towns, but that privilege has for many years been transferred to Lestwithiel. It was also formerly the staple for the yarn manufacture, but that branch of trade is now greatly decayed. It is, however, still the sheriff's prison for debtors; and has a free-school, partly maintained by the duke of Cornwall, and partly by the corporation.

On the south side of the market-place are still some remains of a house of Grey-friars, begun by John of London, a merchant of that city, but a native of Bodmyn, and augmented by Edmund earl of Cornwall. In the time of queen Elizabeth, the above priory was made a house of correction for this county.

Bodmyn has a market on Saturday, pretty well frequented; and four annual fairs for the sale of horses, oxen, sheep, cloth, and a few hops, viz. the twenty-fifth of January, Saturday after Mid-Lent Sunday, Wednesday before Whitfunday, and the sixth of December.

A very remarkable incident of wanton cruelty happened here in the sixteenth century. Immediately after the insurrection which happened in this county during the reign of Edward VI. had been quelled, one Sir Anthony Kingston, then provost marshal of the king's army, came to Bodmyn, and sent an order to the mayor, commanding him to cause a gibbet to be erected in the street, before his own house, by the next day at noon; adding, that he would then come and dine with him, that he might be present at the execution of some rebels, whom it would be necessary to punish capitally, as a sanction to the law, and an atonement to the state. The order was readily complied with by the mayor, who also provided a genteel entertainment for his guest, whom he received with the greatest respect, and took every method in his power to make him welcome. After this intrepid knight, or rather monster in the human shape, had been thus regaled by his unsuspecting host, and pledged by him in wine till he saw his spirits exhilarated, and his heart open; when he asked if the gibbet was ready? The mayor replied, it was; upon which Kingston, with a sneer of wanton and diabolical cruelty, ordered him to be immediately hanged upon it.

Near this town there was formerly a spring called Scarlet-well, but very improperly; for the film which gathered on the surface, reflected not the scarlet only, but all the colours of the rainbow. The water was said to be considerably heavier than that of common springs, and to keep, without losing either its scent or taste, the greater part of the year. Many miracles were pretended to have been performed by this water about the time of the reformation; but the neighbouring magistrates having detected the worker of these lying wonders, the miracle ceased, and the situation of the well is not now exactly known.

From Bodmyn we again directed our route towards the northern coast; and in our way, passed through the borough town of Camelford, so called from there being a ford over the river Camel. It stands on the banks of that stream, two hundred and fifty miles from London, and has enjoyed the privilege of sending two members to the British parliament ever since the latter end of the reign of Edward VI. but was not incorporated till the time of king Charles I. and is now governed by a mayor, eight aldermen, a recorder, and town-clerk. The town is neither large nor populous; and being an inland place, the trade principally consists in the resort of the tanners to purchase provisions, and other necessaries. It has a market on Friday; and four annual fairs, viz. Friday after the tenth of March, the twenty-sixth of May, the seventeenth of July, and the sixth of September, chiefly for the sale of cattle.

Bossiney, or, as it is otherwise called, Tintagel, was the next town we visited. It is situated on two rocks; one of which stands in St. George's Channel, and the other on the main land, two hundred and fifty-two miles from London. It has enjoyed the privilege of sending two members to the British parliament ever since the latter end of the reign of Edward VI.

The two rocks on which the borough town of Bossiney stands, were formerly joined together by a draw-bridge; but that structure was many years since destroyed by the fall of a large part of the cliff on the further side, which has filled up the space between the two parts of the town; but the passage is extremely troublesome and dangerous. The farthermost point of the cliff, formerly surrounded by the sea, is called Blackhead, and is very conspicuous at a considerable distance at sea. There is but one landing-place, situated on the east side of the town, and that very difficult and incommodious.

In the reign of queen Elizabeth, when Carew published his Survey of Cornwall, this town was encompassed by a wall, through which there was a passage, by an iron gate, to a steep and craggy passage, down the declivity of the rock; and underneath this rock or island, there was a cave, extending through it to the main land, on the other side of the draw-bridge, and was navigable for boats at full sea; but the farther end of it is now stopped up by the stupendous fragments of the rock that have fallen down; and when the passage was open, the subterranean darkness, and horrid aspect of the cavern, gave it so dreadful an appearance, that few ventured to pass through it. The place, at present, is very inconsiderable, being little more than the ruins of ancient buildings, most of which were of stone, and joined together by a cement so strong, that where the stone itself is washed away, this frequently remains.

On the top of the promontory are still the ruins of what is called Tintagel Castle: the fortifications stand partly on the peninsula, and partly on the main land. This castle was erected by the ancient Britons, and is celebrated for having been the birth-place of the famous king Arthur in the fifth century, at which time it was the seat of the dukes of Cornwall, and continued to be one of the castles of the earls of Cornwall to the time of Richard, king of the Romans, who entertained here his nephew, David prince of Wales. After the death of Richard, and his son Edmund, all the ancient castles went to ruin, and this among the rest. The castle, the manor, and the borough, were settled by Edward III. on his son the Black Prince, when he created him duke of Cornwall, and his heirs, the princes of the blood, for ever; and accordingly it is become a part of that duchy, and, as such, is held by the corporation, which consists of a mayor and burgessees. It has no market, but three annual fairs, viz. the fifth of August, the twenty-second of November, and the nineteenth of October.

At Denyhall, about two miles south of Bossiney, is a famous slate quarry, which produces the best slate in Cornwall, and indeed in all England, perhaps the finest in the world. The whole quarry is about three hundred yards long, and one hundred wide: the deepest part from the grass is about forty fathoms, and the strata lye in the following order. The green sod, one foot; a yellow brown clay, two feet; then the rock dipping inwards into the hill, towards the south-west, and preserving that inclination from top to bottom. At first the rock is in a lax, shattery slate, with short and frequent fissures, the laminæ of unequal thickness, and not horizontal. Thus the rock continues to the depth of ten or twelve fathoms, all which is of no use, and must be entirely taken away; then a firmer brown stone appears, and which becomes still browner in the air: this is fit for covering houses, and the largest size for flat pavements, never sweating like the cliff slate, which is exposed to the sea air. This is called the top-stone, and continues for ten fathoms deep, the stone improving the lower you go, till you reach the depth of twenty-four fathoms from the grass. Then rises what they call the bottom-stone, of a grey blue colour, and so close a texture, that, on being struck, it will give a clear sound, like a piece of metal. The masses are first raised rough from the rock

by wedges forced into the rock by large sledges of iron, and contain from five to ten, twelve, or fourteen feet, superficial measure, of stone. As soon as this mass is freed from its original bed by one man, another stone-cutter, with a strong broad chissel and mallet, is ready to cleave it into pieces of a proper thinness, which is usually about the eighth of an inch. The flivers are irregular, from two feet long and one foot wide, downwards, to one foot square, and sometimes, though seldom, dividing into such large flakes, as to make tables and tomb-stones.

In this quarry several parties of men work on separate stages or floors, some twelve fathoms from the grafs, some twenty, and others forty fathoms deep, according to the portion of ground belonging to each party. The small shattery stone, not fit for covering houses, serves to shore up the rubbish, divide the different allotments, and form the narrow path up and down the quarry. All the slate is carried, with no small danger, from the plat where it rises, on men's backs, to a distant part of the quarry, where they deposit it, and from whence it is fetched by the persons who purchase it.

The principal horizontal fissures which divide the strata, run from ten to fifteen feet asunder; they are, however, nothing more than chinks, or joints, and contain no heterogeneous fossil. The slate of this quarry is not subject to rot or decay, to imbibe water, or split with falling; but for lightness, and the property of enduring the weather, is generally preferred to any slate in Great Britain.

About three miles north-west of Boffiney, is a small market-town called Boscastle, originally called Bot-teteaux Castle, from a castle built here by a family of that name, the ruins of which are still to be seen. It was once a place of considerable note, but is now greatly decayed: it has, however, still a market on Thursday; and two annual fairs for the sale of cattle, viz. on the fifth of August, and the twenty-second of November.

About nine miles north-west of Boscastle, lies Stratton, a small market-town, surrounded with large and beautiful gardens and orchards, which render the situation extremely pleasant. It stands on a small river, which falls into the sea at a place called Bude-haven, formerly a considerable harbour for shipping; but the sea has thrown up the sand in such a manner, that there are hardly any vestiges of it remaining. Indeed the place that seems to have been anciently the harbour, is now a morass, and meadow-land, extending from the sea-side almost to the town of Stratton, about two miles in length, and nearly the same in breadth. Through the middle of this morass runs the river, which, with the tide, forms the present creek, and opens into the sea by a narrow passage.

Stratton lies two hundred and eleven miles from London, and has a market pretty well frequented on Saturdays; and three annual fairs for the sale of cattle, viz. the nineteenth of May, the eighth of November, and the eleventh of December.

This place is rendered famous in history by a bloody battle fought in its neighbourhood between the royal and parliament forces, on the sixteenth of May 1643. A few days before this battle, major Chudleigh, with a body of the parliament's forces, made an attempt upon Launceston; but not succeeding, retired to Kingston. This miscarriage induced the earl of Stamford to march into Cornwall, at the head of seven thousand horse and foot, and a large train of artillery. He encamped on a hill near Stratton, and detached Sir George Chudleigh, with twelve hundred horse, to surprize the sheriff of the county at Bodmyn. The Cornish loyalists, under lord Mohun and Sir Ralph Hopton, seized this opportunity to attack their infantry during the absence of their horse. Accordingly they formed their small army into four divisions, and attacked the hill in as many different parts. The contest was remarkably warm; but at last the royal party prevailed, the four divisions met upon the summit of the hill, disarmed major general Chudleigh, routed the parliament's forces, and took possession of their camp and artillery; while the earl of Stamford retired with precipitation to Exeter, and Sir George Chudleigh, at the head of his cavalry, took the same route from Bod-

myn, as soon as he was informed of the earl's disaster. Sir Edward Hopton was created a peer, with the title of baron Stratton; but for want of male heirs, it became extinct.

From Stratton we continued our journey, near the banks of the Tamar, to the borough town of Launceston. It is situated on a rising ground, on the river Atery, a little above its junction with the Tamar, two hundred and eight miles from London. This town includes two ancient boroughs, called Dunevet and Newport. The former has sent members to parliament ever since the twenty-third of Edward I. so that Launceston is one of the ancient boroughs of this county; but the borough of Newport, which is only a suburb of Launceston, has enjoyed that privilege no longer than the latter end of the reign of Edward VI. It was incorporated by queen Mary in the year 1555, and is governed by a mayor, recorder, and eight aldermen. The town is populous, and a considerable trade is carried on here, and might be greatly improved, if the Atery was made navigable, which might be done at a very small expence. Here is a woollen manufacture, though not in a very flourishing condition; and considerable quantities of yarn are spun here, and sold to the agents of the Devonshire clothiers. The parish church, which is dedicated to St. Mary Magdalene, and whose image is curiously cut in the side of the wall, is an ancient and capacious structure. The representatives in parliament for the county of Cornwall have been chosen here ever since the reign of Edward I. The winter assizes are always held here, as were also the summer, till by a late act of parliament, the lord chancellor, or lord keeper, was empowered to name any other place in the county for holding it; and since that time, the summer assizes have been held at Bodmyn. Here are still considerable remains of an ancient castle, which, from its great strength, was called Castle Terrible, and given by Richard I. to his brother, afterwards king John. In one part of this castle the assizes are held, and the lower part of it is used as the common goal. Here is a free school, founded by queen Elizabeth. Besides which, there are two charity-schools, for the benefit of poor children of both sexes. The girls, besides reading, are taught to sew, knit, and make blond-lace, and are allowed whatever they can earn. In the west suburb, under the castle-hill, was a priory for canons of the order of St. Augustine, founded by William Warlewaste, bishop of Exeter, and valued, at the general suppression of monasteries, at three hundred and fifty-four pounds and eleven-pence *per annum*. There are still some remains of this priory. In the thirty-second year of Henry VIII. an act of parliament was made for the repair of this, and other decayed Cornish boroughs, by which Launceston was endowed with the privilege of a sanctuary, though it does not appear that any claim was ever made of that privilege.

Launceston has two weekly markets, pretty well frequented, and held on Thursdays and Saturdays. It has also four annual fairs for the sale of cattle, cloth, and a few hops, viz. Whitfun-Monday, the fifth of July, the seventeenth of November, and the sixth of December.

This town gives the title of viscount to the prince of Wales, of whom the manor is held in fee-farm, it having been vested in the eldest sons of the kings of England ever since the reign of Richard II.

Kellington, which we next visited, is a borough town about nine miles from Launceston, and one hundred and ninety-nine miles from London. It stands about a mile from the river Lynher, and is much superior to the generality of Cornish boroughs. It consists of one large street, in which the buildings are elegant. It has a good market-house, and a neat church, which is a chapel of ease to Southill, and was rebuilt by serjeant Ashton. It has a good trade, and a very considerable woollen manufacture, which employs a great number of people. It has no charter of incorporation; but every year, at the court-leet of the lord of the manor, a portreve is chosen; and at the same time, the inhabitants, who have lived here twelve months, are admitted burgeses, and thereby qualified to vote at the election of members to represent the borough in parliament.

Kellington has not long enjoyed the privilege of sending members to the House of Commons, the power being granted in the twenty-seventh year of queen Elizabeth's reign. A weekly market is held here on Saturday; and three annual fairs for the sale of cattle, viz. the fourth of May, the nineteenth of September, and the twelfth of November.

Having thus surveyed the principal places in Cornwall, we proceeded towards Saltash, intending to cross the Crimble Passage into Devonshire; and in our way visited Pentillie Castle, the seat of James Tillie, Esq; It is pleasantly situated on the banks of the Tamar, about mid-way between Kellington and Saltash. The structure is neat and elegant, and the gardens well laid out; but we mention it particularly, on account of a very remarkable clap of thunder which happened near this seat, between one and two o'clock on the second of August 1757. At this time the owner of the above seat, with his neighbours and servants, were lying a-ground in a boat, on a sand-bank in the river Tamar, not half a mile from his own house, waiting the tide to throw a net for salmon, when a sudden peal of thunder broke over their heads. The grass in an adjacent meadow seemed on fire, and the whole field in a flame, when a ball of fire was observed to pass over the hedge, at the top of a very steep wood which hangs over the Tamar. The ball fell on the boat; and passing, in a direct line, from the south-west, entered the boat at the bow, and went out at the stern. Two persons who sat in the bow of the boat, both felt its effects, and one of them was deaf for some time. Mr. Tillie, who sat in the middle of the boat, plainly perceived the ball of fire pass by him, at about three feet distance: it was about five inches in diameter, somewhat sharp and pointed at the fore part. He was violently struck on the back part of his head by the current of air attending the ball; and the corner of his hat was carried away, as if half of a small bullet had been shot through it. One of Mr. Tillie's servants was near the stern of the boat, with his face towards the south-west, but not in the direct line of the fire-ball: he was, however, struck speechless, thrown backwards on the fishing-net, and remained insensible for two or three hours: his face was black, as if the priming of a gun had been blown by accident over it. At the same time, a tenant of Mr. Tillie was standing on the seat at the stern, with his face to the south-west, and had hardly done speaking, when the fire-ball struck him on his left temple, and he fell dead into the river. The day, when this remarkable thunder-clap happened, had been showery, neither hot nor cold; and the sun shone, though faintly, about ten minutes before the explosion.

As in surveying this county, we passed in general near the sea, we could not help observing some advantages and disadvantages attending the situation of this country, and which we shall now lay before the reader.

Remarks on the SEA, and SEA-COASTS of Cornwall.

This peculiar situation is of great utility with regard to the fishery. A great number of creeks are formed, and these, at the proper seasons, are filled with fish of different kinds: at the same time, all kinds of foreign merchandize are imported, at very little expence, at many places, no land carriage being necessary. The native products of the country, together with the fish caught on the coast, and the produce of the manufactures, are readily exported. The cliffs are so near the shore, on both sides of the county, that the draining of mines is, by that means, greatly facilitated. In a word, this maritime situation procures plenty, and promotes trade and commerce in many particulars utterly unknown to the more inland counties: at the same time, the many head-lands, jutting out on each side, necessarily form deep bays, and consequently augment the distresses of seamen in stormy weather. But what is still of worse consequence, is the shooting out of the land into the Atlantic ocean, in the form of a wedge, by which means ships often mistake one channel for another, or are drawn out of their true course by the inequality of the tides or currents. This irregularity of the tides is also

increased near the Land's-End, where the danger is greatest, by the Scilly islands, which, by rendering the channel narrower, increase the velocity of the current, and consequently promote a more than ordinary indraught into both channels.

Near the Land's-End, the tide rises, at new and full moon, from eighteen to twenty-four feet perpendicular; and in stormy weather, with the wind at S. W. it has been known to rise thirty feet. On the neap-tides, it rises only thirteen feet, and sometimes not above ten. At the Land's-End, the tide sets inward from the south, during the time of flood, near nine hours; but in most places between Scilly and the Land's-End, only eight hours; while the ebb continues only three or four hours when the current sets to the southward. This singularity, if not known, and properly regarded, is of dangerous consequence. At the same time, the head-lands are very inaccurately laid down on the maps and charts of this coast, and the latitude and longitude of many of them very erroneous. It is therefore no wonder that so many ships are lost on this coast, which, besides the many horrid rocks surrounding it, is rendered still more dangerous by the irregularity of the tides, and the errors of geographers.

We have already observed, that many of the harbours in Cornwall, particularly those on the north side of the county, are very liable to be choaked with sand. Too much care, therefore, cannot be taken, to prevent ships from throwing out their ballast in improper places, for otherwise the obstructions complained of will be greatly increased, and perhaps rendered too great to be removed. It would have given us pleasure to have remarked, that the attention paid to this particular was equal to its importance; but the contrary appeared in more places than one; and we could not help observing, that present conveniencies were more regarded than future consequences.

Of the INHABITANTS of Cornwall, their CUSTOMS, MANNERS, &c.

Cornwall, especially in the western parts, where there are many tin and copper mines, and the pilchard fishery principally carried on, is very populous. The inhabitants are of the middle stature, healthy, strong, and active; the alternate daily use of cold and heat, wet and dry, hardening their bodies equally against the different extremes of the weather.

Till about two centuries ago, they were distinguished by their language, a dialect of that common to all Britain before the invasion of the Saxons. It is so different from either the Welsh or Armoric, two other dialects of the same language, that they cannot converse with one another. The Cornish is reckoned less guttural than the Welsh, and, on that account, more pleasing to the ear. But this ancient language is now laid aside, and the English used in every part of the county.

Here are still some remains of the Druid superstition, particularly that of making bonfires in every village on the eves of St. John the Baptist and St. Peter. They also deck their doors and porches on the first of May with green boughs of fycamore and hawthorn, and plant the stumps of trees before their houses.

Among their general customs, the manly exercises of wrestling and hurling must not be forgotten. The former is too well known to need any description; but the latter being peculiar to Cornwall, a more particular account of it will be necessary.

Hurling is a trial of skill between two parties, each consisting of an equal number, and matched against each other in pairs. Two bushes are placed in the ground, at a considerable distance from one another, called goals, which one pair of each party is allotted to guard; the rest draw into the middle between the two goals, carrying with them the ball, which is a round piece of wood, about three inches diameter, plated over with silver: some indifferent person throws the ball up, and whoever can catch it, and carry it through his adversary's goal, wins the game. But as soon as it is caught, the pair of the opposite party, matched against the pair, one of which

which has caught the ball, immediately endeavours to stop him, or trip up his heels. They are not at liberty to strike him, but he is allowed to keep them off by thrusting them in the breast with his fist clenched, which they call butting. If he can outrun, or keep off those who assail him in his way, he has still those to contend with who keep the goal. If, in wrestling, any part of the player's body who has the ball touches the ground, or if, being overpowered, he cries Hold, he must throw up the ball, which being again caught, the same contest is repeated till the game is over, which seldom ends but with the day; for he that has the ball being always opposed by two, it is seldom carried through the goal: that side, however, which gave the most falls, kept the ball longest, and pressed the adversary nearest to his goal, carries off the honours of the day.

There are no stated times for the diversions of wrestling and hurling, but they are generally part of their festival entertainments. Every parish has its annual feast, instituted in memory of the dedication of the parochial church. The feast is held on the Sunday; but on the Monday and Tuesday following, all business is suspended, and the young men assemble to hurl, or wrestle, or both, in some part of their parish of the most public resort.

The tinnors hold some holidays peculiar to themselves, particularly the Thursday one clear week before Christmas, and which they call White Thursday, in commemoration of black tin being first melted and converted into white tin on that day; for till that time, they used to export into other parts the tin unmelted, or carry it to the engrosser's melting-house, however distant from the mines.

The tinnors also keep the fifth of March, in honour of St. Piran, who is said to have given their ancestors some very profitable instructions relating to the manufacture of tin.

The inhabitants of Cornwall are remarkably civil and courteous to strangers, and the old English hospitality is still kept up by the gentry of this county; but at the same time, they are reckoned litigious, owing partly to their own disposition, and partly to the result of their polity, and the various branches of trade to which their mining and fishery unavoidably expose them. The lower class are also greatly addicted to drinking, the source of many disorders among laborious people. They are also too much engaged in smuggling, and exchange their bullion and wool for tea and brandy.

Curious PLANTS in Cornwall.

The fir-leaved heath, with many flowers, *Erica foliis curios multiflora*, *J. B.* It grows plentifully near the Lizard, and on Gunhilly downs.

Blue, sweet-smelling toad-flax, *Linaria odorata monspessulana*, *J. B.* found along the hedges near Penryn.

Wood Sage, *Salvia agreffis, seu scorodonia*, *Ger.* growing near St. Michael's Mount.

Water Mint of a spicy smell, *Mentha arvensis verticillata folio rotundiore odore aromatico*, *Ray.* This is a scarce plant, but found under the hedges near St. Berian.

Roman Nettle, *Urtica pilulifera femine magno lini, seu Urtica Romana*, *Ray*, found in a shady ditch at Velintran.

Sheep's Sorrel, *Lapathum acetosum, repens, lanceolatum*, *Ray*, gathered on the north side of St. Michael's Mount.

Hairy Kidney-wort, *Cotyledon hirsuta*, *Ray*, found at Castle Treryn, in the parish of St. Levin.

Sun-dew, *Ros folis*, *Ray*, so called from a speck of water which rests in the middle of the leaf, even in the driest day. It grows in many shallow marshy grounds in this county, and is very prejudicial to the sheep. Mr. Ray observes, that it is of a fiery nature, and that the leaf, applied to the skin, raises an ulcer; that it is accounted hurtful to the sheep, and by the farmers sometimes called the red-rot. This pernicious quality, however, is not owing to the nature of the plant, but to an insect or worm, which feeding on the herb, lays its eggs on the leaf, fixing them there by some poisonous gum. The eggs are swelled with the flowers and leaf; and eluding the juices of the stomach, pass into the chyle, and circu-

late with the blood, till they are at last detained in the capillary vessels of the liver, where, meeting with the necessary degree of heat and moisture, they fecundate; the animalcules grow, and feed upon the liver, till it can no longer perform its necessary functions, and then the creature dies. The sheep are fond of this herb, and therefore the shepherd takes all possible care that they may not come near it.

Creeping; round-leaved; bastard Chickweed, *Alfina spuria, pusilla, ripens, foliis saxifragæ aureæ*, *Ray.* This plant is peculiar to Cornwall and Devonshire, but found more plentifully in the former.

Round-leaved marsh St. Peter's wort, *Ascyrum supinum palustre villosum*, *Ray*, found near the borders of springs, mostly near the Land's-End.

Tender ivy-leaved bell-flower, *Campanula palustre cymbalarie foliis*, *Ger.* found on moist and watery banks.

The least marsh-centaury, *Centaurium palustre luteum minimum*, *Ray*, found on a rotten, boggy ground, between St. Ives and Penzance.

Butterwort, with a small flesh-coloured flower, *Pinguicula flore minore carneo*, *Ray*, found in moist meadows and marshy grounds, especially about Kilkhampton.

Great yellow marsh eyebright, *Euphrasia-lutea latifolia palustris*, *Ray*, found in foggy places near the Land's-End.

Verticillate knot-grass with thyme-like leaves, *Polygonum serpyllifolium verticillatum*, *Ray*, found in watery places between St. Columb and St. Michael's, about Penzance, and near the Land's-End.

Samphire, *Crithmum, seu Fœniculum marinum*, *Ray*; found in plenty upon most of the cliffs near the Land's-End. In the islands of Scilly it is found in great quantities, and more luxuriant than in any other part of the kingdom.

Marsh asparagus, or sperage, *Asparagus palustris*, *Ger.* found on the cliffs at the Lizard Point.

Smooth-leaved rupture-wort, *Herniaria glabra*, *Ray*; found in plenty near the Lizard.

Lesser autumnal star-hyacinth, *Hyacinthus autumnalis minor*, *Ger.* found on the Lizard Point.

Rose-wort, *Telephium-roseum*, *Mor.* gathered among the rocks at the Land's-End.

Eryngo, or sea-holly, *Eryngium marinum*, *Ray*; found in great plenty on the sands, above the high-water mark, between Penzance and Market Jew.

Small sea-crane's-bill, *Geranium pusillum maritimum supinum betonicæ folio*, *Ray*, found in sandy places near Penzance.

Sea cud-weed, or cotton-weed, *Gnaphalium maritimum*, *Ray*; found on the gravelly shore between Penzance and St. Michael's Mount.

The English sea-pease, *Pisum maritimum Anglicum*, *Ray*; on the beach near Penzance.

Antique COINS found in Cornwall.

Among the ancient coins found in Cornwall, were a considerable number of pure gold, dug up in the month of June 1740, in Karnbre-hill, near Redruth. Some were worn, and very much smoothed, not by age, or lying in the earth, but by use, they having no alloy to harden and secure them from wearing. There were no letters discoverable on any of them; some were plain or flat, and others a little concave on one side, and convex on the other: the largest weighed no more than four penny-weights and fourteen grains, and therefore their intrinsic value was about eighteen shillings and fourpence. From the reverse of these coins, which was generally marked with the impression of a horse, some imagined that they were Phœnician, because a few colonies of that people were said to have chosen a horse for their symbol. The place where the coins were found seemed to countenance this opinion, because Cornwall, since the first mention of Britain in history, was famous for its tin, which the Phœnicians, from their superior skill in navigation, engrossed to themselves for many years. But there are coins found in Britain, produced by antiquaries, which are inscribed with British names, and are, with the greatest probability, believed to have

been the coins of princes coteemporary even with Julius Cæsar, on the reverse of which is the figure of a horse. It is, moreover, observed, that the coins found at Karnbre are too rude, and the designs too mean, to have been struck either by Phœnician, Roman, or Grecian artists; that coins of all the different sorts found at Karnbre, have been discovered in different places in Britain, and in no other country; and that those coins which are not inscribed, are probably older than coins of the same nation which are inscribed. From all these circumstances it is reasonably concluded, that the coins found at Karnbre are originally British, and older than the invasion of this island by the Romans.

In the side of the same hill of Karnbre were dug up, in the year 1744, several hollow instruments of brass of different sizes, called celts, together with a great many Roman coins. A vast number of celts have been found, at different times, in different parts of Europe, particularly in Britain. Antiquaries are of various opinions with regard to the design and use of these instruments, though they are generally allowed to be of Roman original. Perhaps they were originally British implements of war, used for the heads of spears, javelins, and arrows.

In the month of July 1749, near a pint of Roman copper-coins were dug up at the remains of the Roman camp on Karnbre-hill; and the year before, about a

quart of the same coin was found near the same place: Roman coins have also been found in and near the ancient tin-mines in this county, which must have been left there, either by the Roman miners, or by the officers appointed by that people for superintending and guarding the mines, which were probably worked by the natives.

At Castle Treryn, near the Land's-End, was found a brass pot full of Roman money: and, in a tenement called Condora, at Helford-haven, not far from Helston, twenty-four gallons of Roman brass money were dug up in the year 1735. All these coins were of the age of the emperor Constantine and his family, and had either the heads of those emperors, or were struck either at the city of Rome, or that of Constantinople. On the other side of Helford-haven, opposite to Condora, forty Roman crowns were found. At Mopas, near Truro, twenty pounds weight of Roman brass coin were dug up not many years ago; and at Trewardreth, near Fowey, many Roman coins have been found.

We shall conclude our account of Cornwall with observing, that it lies in the diocese of Exeter, and province of Canterbury; and sends no less than forty-four members to parliament, viz. two for the county, and two for each of the boroughs, which are twenty-one in number, as may be gathered from the foregoing accounts, where they are all described.

D E V O N S H I R E.

DEVONSHIRE, or the county of Devon, is bounded on the south by the English channel, on the north by Bristol channel, on the west by Cornwall, and on the east by the counties of Somerset and Dorset. It is about sixty-nine miles in length from north to south, sixty-six in breadth from east to west, and two hundred miles in circumference. According to Templeman's survey, it contains about two thousand three hundred and eighty-five square miles, or one million nine hundred and twenty thousand acres; in which are thirty-three hundreds, twelve boroughs that send members to parliament, forty market-towns, three hundred and ninety-four parishes, one thousand seven hundred and thirty-three villages, and near fifty-seven thousand houses. The center of this county is about one hundred and fifty-three miles west south-west from London.

R I V E R S.

This county is watered by a great number of rivers, the principal of which are the Ex, the Tamar, the Touridge, the Taw, the Oke, the Dart, the Plym, the Otter, and the Axe.

The Ex rises in a barren, boggy tract of land, called Exmore, in Somersetshire; and after being joined by several little streams, runs by Tiverton, where there is a stone bridge over the river. About nine miles below Tiverton, it is joined by a pretty large stream called the Colombton; and about two miles lower, by another stream formed by the junction of the Horton and Credy. With these additions, it washes the walls of Exeter. At Topsham, above four miles below Exeter, it receives another considerable addition to its stream; and two miles farther, it is joined by the Ken; and falls into the ocean at Exmouth, after a course of about forty miles. Ships of great burden go up to Topsham, from whence vessels of one hundred and fifty tons are conveyed to the quay at Exeter, by means of an artificial canal, which will be more particularly described in our remarks on the inland navigation of Devonshire.

The Tamar has been already described in our account of Cornwall, and therefore need not be repeated here. We must, however, observe, that about sixteen miles above Saltash, the Tamar receives the waters of the Lid, a small river rising a few miles above Lidford in Devonshire. This little river is particularly remarkable for its course, which is bordered on both sides with prodigious rocks and precipices; and for making itself so deep a fall into the ground, by its incessant friction against the bottom, that the water is scarcely seen from Lidford-bridge, or even the murmurs of it heard. The bridge is nearly level with the road; but the surface of the water is almost seventy feet perpendicular below it; so that it can hardly be seen by a spectator from the bridge.

About a mile above Lidford bridge is another phenomenon still more curious; we mean, a cataract, or fall of water, of more than one hundred feet in height. The water comes from a mill at some distance; and, after a course, upon a descent, of near an hundred feet from the level of the mill, it arrives at the brink of the precipice, from whence it falls, in a beautiful manner, on a projecting part of the cliff, by which it is divided, and falls from thence, in a wider cataract, to the bottom, where, striking the bottom with great violence, acquired by so prodigious a fall, it forms a deep basin, covered with foam, in the ground; thence it runs, in an easy current, to the river Lid, and passes under the bridge, in the deep channel already described.

This remarkable fall of water fills the atmosphere with such a cloud of aqueous particles, that the specta-

tor, on his approach towards the basin, finds himself involved, as it were, in a mist; and, at the same time, the air is so violently agitated by the fall, that it is not easy to approach or stand near the rim of the basin.

The Touridge rises at the foot of a hill near Wowlesworthy, about four miles from Hartland Point; whence it runs, in a south-east course, to a village called Iddlesly, where it is joined by the Oke; after which it is joined by several brooks, and passes, in a large stream, by Biddeford, and falls into Bristol Channel, about two miles below Appledore, where it is joined by the Taw. Ships of very large burden come up to Biddeford, and the river might easily be made navigable many miles higher, as we shall observe in another place.

The Taw rises near Throwley, in the hundred of Woonford; whence it runs, in a northern direction, to a small village called Nummet, where it is joined by a pretty considerable stream. Three miles below Nummet, it is joined by another brook; and, two miles farther, receives the waters of the Maul. With these additions, it becomes a considerable river; and about nine miles below, passes by Barnstaple, where it is joined by another small river; and about five miles below, falls into the Taw, as we have already observed in describing that river. Ships of small burden only go up to Barnstaple, though the river is very wide, but so greatly choaked with sands, that there is not water enough for large ships.

About two miles above Barnstaple, near a small village called North Taunton, is a pit of a large circumference, ten feet deep, from whence there sometimes issues a little bourne or brook, which continues to run for a few days, and then ceases. Many of the inhabitants, who are superstitiously inclined, imagine, that the flowing of this bourne is the forerunner of some public & fatal misfortune.

The river Dart rises at the foot of Dartmore hills, situated in a barren part of the county called Dart-moor, not far from Gidleigh; and, after a course of about fourteen miles, is joined by two considerable streams; whence it continues its course, about five miles, to Totness, where it is navigable for small vessels. About three miles below Totness, it is joined by the Hareborn; and, seven miles farther, falls into the sea at Dartmouth-haven.

The Plym rises in the parish of Shepiston, and, after a course of about seven miles, is joined by a small stream near Plymton, where it becomes navigable for small vessels; and, two miles below, falls into Plymouth Sound, a little below Plymouth.

The Otter rises at the foot of a range of hills on the borders of Dorsetshire, and, after a course of about eight miles, is joined by a considerable stream at St. Mary's Ottery; eight miles below which, it falls into the sea near Otterton.

The Ax rises near Chiddington in Dorsetshire, and enters this county at Ford; and, five miles below, is joined by a pretty large stream at Axminster, falling into the British channel at Axmouth, five miles below Axminster.

Remarks on the INLAND NAVIGATION of Devonshire.

Most of the rivers are navigable some distance from their mouths; but there is only one, viz. the river Ex, which has been rendered so by art. We shall therefore describe its navigation, before we consider the others, which owe this convenience to nature.

The principal stream of the river Ex was formerly navigable to the walls of Exeter; but, upon a difference between the mayor and the earl of Devon, on a very trifling occasion, namely, which of their purveyors should be first served with a dish of fish in the market, the

earl built weirs with timber, sand, &c. which choaked up the river, and entirely ruined the navigation; so that ships could come up no higher than Topsham, where they took in their lading, and where the goods consigned to Exeter were landed, and conveyed from thence, by land carriage, or in small boats, towed up by horses, against the current of the river. Upon this the citizens applied to the Court of Chancery for relief, and, at last, obtained a decree in their favour; but the earl's obstinacy was so great, that even this decree was never executed.

To remedy this inconveniency, the citizens obtained an act of parliament for cutting a navigable canal from Topsham to Exeter, and the work was finished about the beginning of the present century. By this canal ships of large burden go up to the quay at Exeter, where they load or unload with the greatest ease and safety. At the mouth of this canal are large flood-gates, which admit the tide of flood; but as soon as the water begins to fall, the gates shut of themselves, and keep up a body of water sufficient for the purposes of navigation, about the distance of two miles, the canal being so far on a level. The ships, therefore, enter these flood-gates with the tide, and go up the canal to the height above-mentioned, a little below which there is a second pair of flood-gates, which are shut as soon as the vessels are passed through them, and a third pair of flood-gates, opened about two hundred yards higher up. By the shutting of these gates, and opening the others, the water is raised about twelve feet, equal to the whole fall of the canal between Exeter and Topsham. The water being now on a level, the vessels pass over the rising ground, about two miles farther, to the head of the works, where there is another pair of flood-gates across the river, whereby the waste water, or that not wanted for the purposes of navigation, passes over a strong stone weir, into its natural channel. By this means a stagnant pool of water is formed above the upper flood-gates, where the vessels lie at their moorings, and load or unload at a quay adjoining to the city walls.

We have already observed, that there is no other inland navigation, either wholly made or assisted by art, in this county; but the mouths of many of the rivers are navigable, and some of them to a considerable distance.

The Ax is navigable only for small vessels to Axmouth bridge, but might be rendered navigable for barges to Axminster, which would be very advantageous to this part of the county, if the bay at the mouth of the river afforded the shelter to ships it did formerly; but having been neglected during the time the monks of Sion-Abbey were in possession of the place, it was choaked up with sand, and in that condition it still continues.

About mid-way between the Ax and Otter, is the small river Side, which rises at the foot of a hill about four miles from the English channel, and falls into the sea at a place called Sidmouth. The mouth of this river was formerly a considerable port, but being neglected by the monks of Sion Abbey, to whom it belonged, the harbour was choaked up with sand, so that there is now only water sufficient for vessels of small burden.

The Otter is navigable, for small vessels, to Otterton bridge; and the navigation might easily be continued to Ottery St. Mary's. It must, however, be observed, that as the water is shallow at the mouth of the river, and obstructed with sand-banks, ships of any large burden could not enter the river.

We have already observed, that the Ex is navigable, for vessels of considerable burden, to Topsham. The passage, however, at the mouth of the river, is but narrow, having rocks on the east side, and sands on the west; nor is the water on the bar more than six or seven feet deep at low water, but the tide rises fourteen or fifteen feet, so that it is deep enough at high water. When ships are within the bar, they may ride afloat at a place called Star Cross, about a mile and a half from the river's mouth; but those that go up to Topsham, lie a-ground on the ooze at low water.

About five miles farther to the S. W. is a small haven called Timmouth, at the mouth of the river Tin. There is not, however, above three feet water in this haven at low water; so that vessels of any burden must go in with

the tide, which flows up almost as high as Comb-bridge, within two miles of Newtonbushel.

The river Dart is navigable from its mouth to the bridge at Totness, where the water rises ten or twelve feet on a spring-tide. Ships of very large burden go up to Dartmouth, which stands about a mile above the entrance. It is, however, very dangerous going into Dartmouth-haven, unless the wind be very fair; for the entrance is narrow, and the land, on each side of the passage, very high, which occasion strong gusts of wind, when it blows from either of the shores.

About four miles to the westward of the Start Point, is a small harbour called Salcomb, formed at the mouth of a river of the same name. It is now navigable for vessels about three miles above its mouth, and small boats go up to Kingsbridge, near to Dadbrook. The entrance of the harbour of Salcomb is between two points of land, called the Praule and the Bolt-head. There is a bar of sand across the mouth of the haven, on which the water is only eleven feet deep at low water, but within the bar there is at least three fathoms. On the west side, about half a mile within the bar, is an old castle, with a ledge of rocks before it; and directly opposite, on the other side, is a remarkable rock called the Mewstone, which is covered at high water, but the top becomes dry about a quarter ebb.

The river Plym is navigable for boats about two miles from its mouth, within half a mile of Plymton.

The harbours of any consequence, on the north side of this county, are Biddeford, Barnstaple, and Ilfordcomb.

The harbour of Biddeford is at the mouth of the Touridge and Taw. Before the mouth of the harbour is a good road, called Biddeford Sound, or Barnstaple Bay. There is a bar at the mouth of the harbour, but water sufficient for a ship of three hundred tons burden at half flood. A little above Appledore, where there is a safe road for ships, the harbour divides into two branches, the western stream going to Biddeford, and the easternmost to Barnstaple: the former is navigable, for ships of three hundred tons burden, to the very quay at Biddeford, and for small craft, to Torrington Bridge; but the latter is almost choaked up with sand, so that small vessels only can come up to Barnstaple.

Ilfordcomb lies about twelve miles to the eastward of Barnstaple bay. There is a good road before the harbour, and water within the haven sufficient for ships of considerable burden.

AIR AND SOIL.

The air of this county is sharp upon the hills, and mild in the vallies, but in general healthy and pleasant. The soil is very various. About Tavistock, Bridgestow, Oakhampton, Holfworthy, Biddeford, Great Torrington, Chulmleigh, Chagford, Moreton, Hampsted, and all round the borders of Dartmore, as well as that large forest itself, it is very moory and fenny, and naturally barren, in some places producing only a dwarf kind of furze of little or no value. In other places, nothing grows but rushes, or a coarse four kind of pasturage, which the cattle will not eat, and therefore dies up, and withers into a sedge. The earth here is generally of a stiff clay, through which the water cannot find a passage: this renders the ground very unhealthy to cattle, especially sheep, which, in these parts, are of a small kind, and very subject to the rot, especially in wet seasons, by which great numbers are destroyed.

The principal, indeed the only profitable return the husbandman can make from these lands, is by breeding black cattle, for which they are very well adapted; and here many of those fine oxen brought up to Smithfield by the drovers of Somersetshire, are bred, and afterwards fattened in the fine pastures between Bridgewater and Wells.

The northern parts of the county are of a very different nature from the former: they consist, in general, of a dry, healthy soil, especially about Ilfordcomb, Southmoulton, and all along the borders of the forest of Exmore. These downs do not indeed afford luxuriant pasture,

ture, but are very good grazing lands for sheep, and, by the arts of the husbandman, produce tolerable crops of corn; we say tolerable, because they are by no means comparable to those produced in the eastern and middle parts of the county. In the latter, the soil is strong, mixed, and of a deep red colour, intermixed with loam, and produce very large crops of corn, and the best pease in England. Nor are these parts less valuable for their pastures, where great numbers of sheep and black cattle are fattened.

To the northward of Dartmouth are several villages, called the South-hams, where they make such large quantities of cyder, that a great number of the tenants pay their rents with the profits arising from that commodity only. The sea-captains find it very serviceable in their ships, and therefore take great quantities of it; for it has been found by experience, that one ton of cyder will go as far, if not farther, than three tons of beer; and, at the same time, is much more wholesome, especially in hot climates. We were assured, that ten thousand hogheads of cyder have, one year with another, been exported from this county to London, for many years past.

The reader must not, from what has been said, imagine, that the lands, in any part of the county, are all of the same kind, and equally valuable: downs, fens, rocks, and woods, are interspersed among the best lands; as there are also some good arable and pasture grounds among the most desolate and barren. The above general description, therefore, is intended to be taken in this limited sense.

HUSBANDRY of Devonshire.

The husbandmen of Devonshire are equal to any in the kingdom for care and attention, and take every method in their power to assist nature, and, consequently, to improve the profits of their farms.

Among other improvements which the art of husbandry owes to the farmers of this county, is that of cutting up the turf, which is afterwards dried and burnt, and the ashes spread over the surface of the soil, by way of manure.

This method of improving land, generally called Denfhering, or Devonfhering, from its being first practised in this county, is performed in the following manner:

When it is intended to break up any piece of waste land, the work should be begun in the winter, in order to get rid of the three principal obstacles, namely, water, stones, and such large roots as the paring-mattock, or, as it is called in Devonshire, the beating-ax, may not be strong enough to cut asunder. About the middle of March, therefore, the paring the ground should be begun, by a number of labourers, proportioned to the quantity of land intended to be pared.

The turfs cut up should be about a foot and a half long, a foot broad, and four inches thick. By cutting the turfs of this thickness, the matted roots of all the trash growing on the surface, will be inevitably destroyed; a circumstance absolutely necessary, for otherways they will make fresh shoots, injure the corn, and, in time, choak it entirely.

If the weather be dry, these turfs may be placed a little slanting, by resting one of the ends of one turf upon the extremity of the other; but if the weather should not be favourable, they must be piled up as fast as cut, or even placed upon their ends, two and two, meeting at the top, and being farther asunder at the bottom, like the roof of a house.

When the season is not too wet, the turfs will generally dry sufficiently in about three weeks, even without being turned; but in rainy years, they require a longer time, and must be turned more than once, to prevent their striking out new roots and shoots, which would hinder them from burning.

When the turfs are sufficiently dry, they must be piled up in round heaps, about ten feet high, and of the same diameter at bottom. The heathy, or grassy side of the turf, must be placed downwards, and the earthy side upwards. A small hole must be left in the inside, in order

to form a kind of chimney, the opening of which should face the wind. As soon as the heaps are finished, they should be set on fire, by putting a little lighted straw or heath, with an iron fork, into the chimnies of the furnaces. The dry heath, grass, and roots, will catch instantly, and, in a few moments, the fire will become so violent, as hardly to be approached. It may then be left, after taking proper precaution to prevent it from extending farther than intended, especially if it be near any hedge, wood, or heath, where it might do great mischief.

When the turfs are thoroughly burnt, the ashes are spread over the field, which is then sown in the common manner, and generally produces a large crop.

We have already described the method of using ore-weed and sea-sand as manures, in our account of the Cornish husbandry; and shall now add, that the same productions are also used in Devonshire; but they have improved the practice in some parts of the county, by making a compost dunghill with ore-weed, sea-sand, lime, and the dung of animals; these various substances, by being blended together, make an excellent and very profitable manure. Great part of the ground in the south-hams lies on a stratum of marble, which they break up and burn into lime, and dress their lands with it to great advantage. Sometimes the lime is previously mixed with mould, and afterwards spread upon the land. They also make use of marle, which is found in various parts of the county, for improving their farms, and are never disappointed in their expectations.

The grains chiefly sown here, are wheat, barley, pease, &c. of all which there are large crops in several parts of the county. The turnip husbandry is also introduced here, in several districts, with great advantage. Nor are the artificial pastures forgotten; lucern, burnet, the different species of clover, and other plants of that kind, being cultivated by some of the most intelligent husbandmen.

Of the MINES of Devonshire.

Devonshire was formerly famous for its mines of tin; and four stannary towns were appointed; viz. Ashburton, Tavistock, Plympton, and Chagford, all lying near the forest of Dartmore. In those towns the tin was coined, and the courts of the four jurisdictions were held. The stannators, who composed the parliament, like that still held in Cornwall, were chosen out of the principal inhabitants of these districts. But, by divers charters granted to the tanners by Edward I. and others, the parliament, or supreme court of the stannaries, was ordered to be held upon Crocken Torr, a famous hill situated in the middle of Dartmore, and far from any house. In this desolate place, where no refreshment can be purchased, destitute of any shelter from the weather, nor any seat, except a bench of moor-stone, the stannators assembled, in obedience to a writ issued for that purpose by the lord warden, who presides in the assembly; and this place of meeting was called the Parliament-house. It was, however, the custom, as soon as the stannators, or members of this parliament, were met together upon Crocken Torr, to adjourn the court to one of the stannary towns, generally Tavistock, where the business was dispatched. Here the price of tin was fixed, differences in relation to the works adjusted, and acts made for the regulation of every particular relating to the tanners and the mines. A large volume of the acts of this parliament was printed in the time of queen Elizabeth, when the earl of Bedford was lord warden.

In the time of king John, these mines produced such quantities of tin, that the coinage of it was let at one hundred pounds a year, when that of Cornwall was farmed at sixty-six pounds, eighteen shillings and fourpence. At present, the mines are greatly neglected; and though there are still some works here, yet the advantages arising from them all, except two or three lately opened, are very trifling and insignificant.

Here were also formerly mines of silver, which proved very advantageous to the crown of England; for we find, not only several grants made by Edward III. and other

H kings,

kings for carrying them on, with a reservation of the tenths to the church; but it even appears from the records of the Exchequer, that very large sums have been raised from the working of them: for in the year 1293, one William de Wymondham was overseer of these works; and, by his art and industry, three hundred and seventy pounds weight of fine silver were refined out of the lead ore; and this sum king Edward I. gave as a portion, with his daughter Eleanor, to the count de Barre.

The next year, five hundred and twenty-one pounds weight of silver were extracted, and sent to London, in order to be coined there; and the succeeding year, in which the Derbyshire miners were sent for to assist the above-mentioned William de Wymondham, he sent seven hundred pounds weight more to the mint, for the same purpose.

After this, more mines were discovered, and proper miners sent for again out of Wales, and from the Peak of Derby; but what advantages accrued from them, cannot now be known.

In the reign of queen Elizabeth, the mines were again worked by one Sir Beavis Bulmer, a curious refiner, who extracted large quantities of silver from the ore, and out of which he ordered two cups, very rich and capacious, to be made: one of these cups was presented to William Bouchier, then earl of Bath, and lord warden of the stannaries; and the other to Richard Martin, at that time lord mayor of London. We have no account of the weight of the former, but the latter weighed one hundred and thirty-seven ounces.

Some gold mines have also been discovered in Devonshire, but, for some substantial reasons, have never been worked to advantage.

There are also mines of lead, iron, and copper; but the first only are worked.

TRADE and MANUFACTURES.

There are in Devonshire very large manufactures of kerseys, serges, long-ells, shalloons, narrow-cloths, and blond-lace; in which, and in corn, cattle, meal, and sea-fish, particularly herrings and pilchards, the inhabitants carry on a very large trade. They have also ships in some of their ports, with which they trade to Portugal, Spain, the West Indies, and other colonies of America.

CITY, BURROUGH, and MARKET TOWNS.

The first place we visited in Devonshire, was Plymouth, where we landed from Saltash in Cornwall.

Plymouth is situated at the mouth of the river Plym; which, a little below the town, falls into a bay of the English channel, called Plymouth Sound. The town is situated on a point of land, having the river Plym, the mouth of which is called Catwater, on one side; and the Tamar, here called Hamouze, on the other, about two hundred and twenty miles from London. It was originally only a small fishing-town, but, by its fine situation, and the goodness of its harbour, it is now one of the largest places in the county, and sends two members to parliament. It is governed by a mayor, twelve aldermen, twenty-four common council-men, a recorder, and a town clerk. The election of the mayor, which is annual, as in other corporations, is carried on in the following manner: the mayor in office, and the aldermen, chuse two persons, and the common council chuse two others. These four persons, whom they call Alfurers, appoint a jury of thirty-six persons, and by this jury the mayor is elected. The officiating mayor, his predecessor, and the two senior aldermen, are justices of the peace.

Opposite to the town; and in the middle of the harbour, is a small island, called St. Nicholas. It is surrounded with rocks, and has a strong castle on it, which commands both the entrance into Hamouze, and also that into Catwater. On the opposite shore, over against St. Nicholas's island, is the citadel of Plymouth, erected in the reign of king Charles II. The walls of this citadel are three quarters of a mile in circumference, and for-

tified with five regular bastions, on which, and the curtains, are mounted one hundred and sixty-five large pieces of ordnance. The citadel is surrounded with a deep ditch, out of which all the stone used in the works was dug. There is also a battery of large cannon, lying almost level with the water's edge, and called the Old Fort. These fortifications, with another fort near the water, on Mount Edgcombe, form a sufficient security for the ships, either in Hamouze or Catwater.

The town of Plymouth stands above the citadel, on a gentle declivity of the same rock, sloping towards Catwater, where there is a kind of natural mole, or haven, called Sutton-pool, from the ancient name of the town; with a quay, and other conveniencies for loading and unloading ships: nor is the trade carried on here inconsiderable.

Here are two handsome large and well built parish churches, one dedicated to St. Andrew, and the other to the memory of king Charles I. These churches, though there are several meeting-houses in the town, have each a very large cure of souls. The profits of the pews go to the poor. Here is a charity school, four hospitals, and a work-house; in all which above one hundred children are clothed, fed, and taught. Colonel Jory gave a charity to one of the hospitals, for the maintenance of twelve poor widows. He also gave a mace, worth one hundred and twenty pounds, to be carried before the mayor; and six good bells to Charles's church, valued at five hundred pounds.

Till queen Elizabeth's reign, the town of Plymouth suffered greatly for want of fresh water; but has been, since that time, well supplied by a spring seven miles distant, the water of which was conveyed hither at the expence of the famous Sir Francis Drake, a native of Plymouth.

This town has a good pilchard fishery, a custom-house, and carries on a very considerable trade to the Streights and West Indies.

About two miles up Hamouze, or mouth of the Tamar, are two docks, one wet and the other dry; with a basin, two hundred feet square, hewn out of a mine of slate, and lined with Portland stone. The dry rock is formed after the model of a first rate man of war, and the wet dock will contain five first rates. The docks and basin were constructed in the reign of king William III. Here are also magazines of all kinds of naval stores, with every conveniency for building and repairing ships. In a word, the whole forms as complete, tho' not so large an arsenal as any in England.

The harbour is very capacious, and greatly frequented, both in times of war and peace.

In the reign of Edward III. the French landed and burnt part of the town, but were soon repulsed, by Hugh Courteney, earl of Devon. In the reign of Henry IV. they landed again, and burnt six hundred houses.

The toll of the markets, corn, yarn, &c. together with the profits of the mill, which form a very considerable sum, belong to the corporation; and the revenues of the shambles, farmed at one hundred and sixty pounds a year, are appropriated to the mayor's kitchen.

Between Plymouth and the sea, is a hill called the Haw, on the summit of which is a delightful plain, affording an enchanting prospect, and a curious compass is placed here for the use of mariners. On the brow of this hill is a fort, built by king Charles II. which at once awes the town, and defends the harbour; for it must be remembered, that Plymouth, during the last civil war, adhered to the parliament, and, by an obstinate resistance, did more injury to the royal cause than any other town in the west of England; the king's army being obliged to raise the siege, after having invested the place several months.

In the reign of Edward I. when this town first sent members to parliament, it was divided into two parts, called Sutton Vojtert, and Sutton Prior. It continued to send members to the British parliament till the fourteenth of Edward III. after which the practice was discontinued till the twentieth of Henry VI. when the privilege was renewed.

Here are three well frequented weekly markets, viz. on Monday, Thursday, and Saturday; and two annual fairs,

fairs, held on the twenty-fifth of January, and the twenty-first of September, for horned cattle and woollen cloth.

Being desirous of viewing the light-house built on the famous rock called the Eddystone, we procured a small vessel to carry us thither. The Eddystone lies about four leagues S. by W. from Ramhead, the western cape of Plymouth Sound. Many ships were formerly lost upon this dangerous rock, which is covered at half tide, and such a depth of water close to it, that ships often struck upon it when no danger was apprehended.

In order to prevent these dreadful accidents for the future, the ingenious Mr. Winstanley undertook to erect a light-house on it. He finished the task in the year 1696, and the work was so well performed, that it stood firm, for some years, against all the attacks of storms. The able artist often visited this structure, and, at different times, added new works to strengthen it; till he was so confident of its firmness and stability, that he usually said to those who doubted of its standing in bad weather, that he only desired to be in it when a storm should happen.

His wish was unfortunately fulfilled; for in the dreadful tempest which happened on the twenty-seventh of November 1703, he was in the light-house, and made signals of distress, but no vessel could venture out to his relief; and, when the morning appeared, no remains of the light-house were to be seen; it was demolished the preceding night, and every soul in it perished. A few days after this unfortunate accident, a ship called the *Winchelsea*, homeward bound from Virginia, not knowing the light-house was down, ran upon the rock, and was lost, with all her lading, and the greater part of her crew.

To prevent the like misfortunes for the future, the corporation of Trinity-house procured an act of parliament in the fifth year of the reign of queen Anne, for building another light-house on the Eddystone; and a second was, soon after, finished; but this also shared the fate of the former; and a third has been lately erected by the ingenious Mr. Smeaton, on a much better plan than any of the preceding, and bids fair to resist the fury of the most violent tempest ever known in this country.

The prospect from this light-house, in fine weather, is very beautiful; the number of ships passing up and down the English channel, together with those coming in and going out of Plymouth Sound, form a moving picture, remarkably pleasing. At the same time, the surge of the waves, in calm weather, against the rock at low water, or against the sides of the light-house, when the rock is covered, sufficiently intimate the horror that must fill the mind, from the howling of the wind, and the savage impetuosity of the waves, foaming and dashing against the structure, during a violent tempest, when all possible relief is cut off, and safety depends entirely on the strength of the building.

After viewing this ingenious piece of architecture, we returned to Plymouth, and crossed Catwater, in order to visit Plympton, an ancient borough town, situated on a small stream which falls into the river Plym, two hundred and eighteen miles from London.

This town is called Plympton Maurice, or Earl's Plympton, to distinguish it from Plympton St. Mary's, a town half a mile distant. It first sent members to parliament in the twenty-third year of the reign of Edward I. and is one of the stannary towns. Here are still the ruins of a castle, once the seat of the ancient earls of Devon; and the tenure, called Castle-guard, for defending and repairing the walls of the above castle, continues to this day.

It is a populous town, though it consists principally of two streets, of ordinary houses. There is, however, a guild-hall, supported by stone pillars, where the corn-market is kept. It has also the best free-school in the whole county. The school-house, which, like the guild-hall, stands upon stone pillars, was built, in the year 1664, by Sir John Maynard, one of the trustees of Elizeus Hele, Esq; of Cornwood, who left fifteen hundred pounds a year to such uses.

Plympton was incorporated in the reign of queen Elizabeth; and is governed by a mayor, recorder, eight

aldermen, or principal burgesies, who are called common council-men, a bailiff, and a town-clerk.

Here is a weekly market on Saturday, pretty well frequented; and four annual fairs, held on the twenty-fifth of February, the fifth of April, the twelfth of August, and the twenty-eighth of October, for horned cattle and woollen cloth; a very considerable manufacture of serges, and other woollen goods, being carried on in this town.

Plympton St. Mary's is almost joined to the town we have just described, and was once the mother church. It had a college, consisting of a dean, four prebendaries, and three ministers, founded by one of the Saxon kings. But this society was dissolved by William Warlewast, bishop of Exeter, who settled here, in the year 1121, a priory of canons regular, of the order of St. Augustine, dedicating it to the apostles St. Peter and St. Paul. Its yearly revenues, by the benefactions of earl Baldwin de Redveris, and others, exceeded any in the diocese of Exeter, being valued, at the dissolution of monasteries, at nine hundred and twelve pounds, twelve shillings and eight pence.

Leaving Plympton, we continued our tour, through a very pleasant country, and crossed the rivers Yalme and Arme, stopping at

Modbury, a small market-town situated on a stream that discharges its waters into the river Arme, two hundred and twenty-three miles from London. It was once a borough town, and sent members to parliament in the reign of Edward I. but is now a small place, and famous only for its ale, though there is a tolerable manufacture of serges carried on here.

It has a small market on Thursday, besides an annual fair, held on the twenty-fourth of August, for the sale of cattle.

Here was a cell of Benedictine monks, belonging to the abbey of St. Peter sur Dieu, in Normandy, as early as the reign of king Stephen. It was founded by one Ruan, and dedicated to St. George. It was valued at about seventy pounds *per annum*. Upon the dissolution of the alien priories, Henry VI. gave this cell to the college of Eaton; Edward IV. gave it to Tavistock-abbey; and, lastly, it came to King's college in Cambridge.

The next town we visited was Kingsbridge, situated on the river Salcomb, which is here navigable for boats, two hundred and one miles from London. It is a pretty considerable town, though the church is only a chapel of ease to Chifton. Here is a charity-school, founded by Mr. Crispin of Exeter; and a stone bridge over the Salcomb. The market is held on Saturday; besides which, there is an annual fair on the twentieth of July, for the sale of cattle, cloth, and shoes.

In the neighbourhood of Kingsbridge is another small market-town, called Dodbrook. It is situated on a small stream, called the Dod, near its influx into the Salcomb. Here is a charity-school, and the place is remarkable for paying the parson tythe of a liquor called White Ale. It has a small market on Wednesday, and an annual fair on the Wednesday before Palm Sunday, for the sale of cattle, cloth, &c.

From Dodbrook we continued our journey towards Dartmouth, stopping at a small village called Brixham, about three miles from that town, in order to view a remarkable curiosity formed by the hand of nature, and called Lay-well, famous for its ebbing and flowing.

This celebrated spring is situated on the declivity of the hill, about three quarters of a mile from the sea, and considerably above the level of the water on the highest spring tide. The form of the well is nearly round, and about six feet in diameter. There is a rim of stone round it, and about an inch and a half difference in the height of the water, at its different periods of flowing and ebbing. There is very little irregularity in the time of its performing these different motions of flux and reflux; for both together generally happen in six minutes, or ten times in an hour. If holes be dug in the earth near the well, the water in them will rise and fall in the very same manner; and these holes, we found by experiment, were filled and emptied by turns; and it was pleasing to see the water at first rush in through several passages, till the hole was full, which little flood would continue near

three minutes, when the water would begin to ebb, and so continue for something more than three minutes, till the hole was dry, and we could see the fluid run away through a number of small ducts: in a little time the water returned again, flowed and ebbed as before, and so on continually, without any material variation. The waters of Lay-well supply a stream about five feet wide; and, what is very remarkable, we observed, that the waters of the stream ebbed and flowed with the well, about half an inch perpendicular. It is abundantly evident, from the very situation of the well, that it does not derive its waters from the sea; because it is very considerably higher than the high-water mark of the highest spring tide, but from waters collected in subterraneous basons, situated in the side of the hill above the spring. These basons, by the help of natural syphons, cause this famous spring to ebb and flow in the manner we have already described. The water of this spring is remarkably clear, and very cold in summer, though it never freezes in the winter: the neighbouring inhabitants esteem it medicinal in some kinds of fevers.

About three miles from this remarkable spring is the borough town of Dartmouth, situated at the mouth of the river Dart, one hundred and ninety-two miles from London. It was incorporated by king John, and formed out of three distinct towns, Dartmouth, Clifton, and Hardnefs. It was called Clifton from the cliffs on which most of the houses were situated, and out of which many of them were dug. It is governed by a mayor, twelve magistrates, called Masters, twelve common councilmen, a recorder, town-clerk, bailiff, and high steward. The three last are chosen by the mayor and magistrates, who have also the power of making freemen. The mayor, bailiff, and coroner, are chosen annually. Here is a court of sessions, and a water bailiff's court, holden by a lease of three lives from the dutchy of Cornwall, for which the corporation pays fourteen pounds a year reserved rent.

The town, which is a mile in length, stands on the side of a craggy hill, with very irregular streets, being sometimes two or three, one above another; yet, notwithstanding this, the houses, in general, are very high.

The harbour is so capacious, that five hundred sail of large ships may ride in it with safety: at the same time, it is defended with three castles, besides forts and block-houses, and the entrance may, upon occasion, be shut up with a chain; so that it is a safe retreat in time of war.

Here is a large quay, and before it a spacious street, inhabited principally by merchants, who carry on a great trade to Portugal and the Plantations, especially to Newfoundland, where they catch large quantities of fish, which they carry to Spain, Portugal, and Italy. Here is also the greatest pilchard fishery of any in the west, except Falmouth in Cornwall; and the shipping, and trade of this town in general, are the most considerable of any in the county, except Exeter and Plymouth. Here are three large churches, besides a meeting-house.

King John, who incorporated Dartmouth, also endowed it with the privilege of sending members to the British parliament; and they are now chosen by seventy-eight freemen, and the return made by the mayor. By a grant of Edward III. the burgeses are toll-free throughout England; and in the reign of Richard II. they obtained the exclusive right of exporting tin, in consideration of their having assisted him with ammunition and provisions in his war with France. Edward IV. to reward their courage against the French, translated the port hither from Fowey, and gave them twenty pounds a year in fee-farm; to which Richard III. and Henry VIII. added twenty pounds more.

Dartmouth was burnt by the French in the reign of Richard I. and afterwards, in the time of Henry IV. They attempted it a third time, but were repulsed, and chiefly by the bravery of the women, who fought like Amazons, destroyed great numbers of the enemy, and took M. Caste!, the French general, three lords, and twenty-three knights, prisoners. Here is a weekly market, very well frequented, on Friday; but no annual fair.

From Dartmouth we pursued our journey to Totness, a considerable town, situated on the Dart, one hundred

and ninety-five miles from London. The river is navigable to this town for boats, the tide rising here ten or twelve feet. Here is a fine stone bridge over the river, leading to Berry-pomeroy. It is a borough by prescription, and the oldest in the county, having sent members to parliament ever since the twenty-third of Edward I. King John made it a corporation, consisting of fourteen burgo-masters, one whereof is mayor, who, with his predecessor, and the recorder, are justices of the peace. The common council consists of twenty-eight members, besides which, there are a few freemen, chosen by the mayor and masters.

The church is spacious and elegant, adorned with a fine tower, crowned with four pinnacles, ninety feet high. The town-hall and charity-school are both good buildings.

The town itself consists chiefly of one broad street, three quarters of a mile in length, situated on the side of a rocky hill declining to the river. It was formerly walled in, and had four gates; but the south gate only, and some small parts of the rest, are now remaining. Here are also the ruins of a castle, which was once of considerable strength. The chief trade of the town is the woollen manufacture, but here are more gentlemen than tradesmen of note.

This place is noted for the peculiarity of its loyal address to king George I. upon the union of Charles VI. emperor of Germany, with the king of Spain, by the treaty of Vienna; when the members of the corporation assured his majesty, they were ready to grant him, not only a land-tax of four shillings in the pound, but, if his service required it, to give the remaining sixteen shillings.

Salmon, and other fish, are very numerous in the river Dart, especially near this town, where they have a peculiar method of catching them, by means of a spaniel trained for that purpose. On the south side of the river, and on a narrow cut or channel formed on purpose, stands a corn-mill; the mill-tail, or floor for the water below the wheels, is wharfed up on either side with stone, above high-water mark, about twenty or thirty feet in length below the mill. At the lower extremity of this wharfing is a grating of wood, the cross bars of which are sharp at the end, and stand pointing towards each other, like the wires of a mouse-trap.

When the tide flows upwards, the fish can easily pass between the points of these cross bars; but the gates of the mill being shut, they can go no higher; and, when the tide ebbs away, are left behind, being unable to pass the points of the grating; so that they are left at the bottom of the channel, in about a foot and a half of water. In order to catch the fish thus left behind by the tide, they fix a shove-net at one end of the stream, and put in a spaniel, properly taught, at the other, and he drives all the fish into the net, by which means they are taken without any further trouble. We were informed, that it is no uncommon thing to take fifty salmon at a time, from seventeen to twenty inches in length.

They have also very excellent trout here, which, with the cheapness of other provisions, induce many persons of small fortune to settle at Totness, where they can live very elegantly at a little expence.

Here is a well frequented market on Saturday; and four annual fairs, held on Easter Tuesday, the first of May, the twenty-fifth of July, and the twenty-eighth of October, for the sale of horses, sheep, black cattle, and cloth.

On the other side of the bridge, already mentioned, is Berry-pomeroy, where there is an ancient castle built by the descendants of Radulph de Pomeroy, who held this, and about fifty other lordships, in the time of William the Conqueror.

About three miles to the westward of Totness, is Brent, a small market town situated on the river Arme, one hundred and ninety-eight miles from London. It has a manufacture of serge, a small market on Saturday, and two annual fairs, viz. the thirteenth of May, and the tenth of October, for cattle.

Ashburton lies about ten miles, upon a small stream, about half a mile above its influx with the Dart, and one hundred and ninety-one miles from London. It is an ancient

ancient borough by prescription, and governed by a chief magistrate, called a Portreve, who is chosen annually at a court of the lords of the manor, and is the returning officer at the election for members of parliament. The town consists chiefly of one large street, and has a handsome church, built in the manner of a cathedral, and adorned with a tower ninety-one feet high, on which is a spire covered with lead. The chancel of this church is very large, and has several stalls in it, like those in collegiate churches. Here is also a chapel, which was formerly a chantry, but now used as a school, as well as for the meetings of the parish, and the election of members to serve in parliament. It is a great thoroughfare, standing on the principal road leading from London to the Land's End, and about half way between Exeter and Plymouth. It is one of the flannary towns, has a good manufacture of serges, and remarkable for having several mines of tin and copper in its neighbourhood. Here are two weekly markets, held on Tuesdays and Saturdays; the former for wool and yarn, and the latter for provisions: besides which, here are four annual fairs for the sale of cattle, viz. the first Thursday in March, the first Thursday in June, the tenth of August, and the first of November.

At Buckfastleigh, a village about three miles from Ashburton, was an abbey of the Cistercian order, founded in the year eleven hundred and thirty-seven, by Ethelward, son of William Pomeroy. It was dedicated to the Virgin Mary, and its annual revenues, at the suppression of monasteries, amounted to four hundred and sixty-six pounds, eleven shillings and two pence.

In the fourteenth year of the reign of Charles I. there happened at Withicomb, a village in the neighbourhood of Ashburton, a violent storm of thunder and lightning, during which, a ball of fire broke into the church where the people were assembled at divine service, killed three persons, wounded sixty-two, and did so much damage to the church, that the repairs amounted to above three hundred pounds.

From Ashburton we passed to Newton Bushel, sometimes called Newton Abbot, a market-town situated on the river Teign, one hundred and eighty-seven miles from London. It is a large town, but the buildings very mean and irregular. It has a manufacture of serge, and a weekly market on Wednesday, very well frequented; and three annual fairs, viz. on the twenty-fourth of June, for black cattle; on the first Wednesday in September, for cheeses; and on the twenty-sixth of November, for woollen cloth.

At Stoke, a village near Newton-bushel, John de Stanford obtained leave from king Edward III. to found a religious house in honour of the Virgin Mary and St. Andrew, for a warden, and several chaplains, to whom he gave licence of Mortmain to hold the manor of Stoke, together with the advowson of the church; but it does not appear, whether this religious house was ever built and endowed according to the donor's intention.

Near the mouth of the river Teign, on which the town of Newton-bushel is situated, are two villages, called East and West Teignmouth, or Tingmouth. The former is famous for the landing of the Danes, in their first expedition to England, in the year 970, in order to view the country previous to their invading it. The French burnt this village in queen Anne's war; but the inhabitants, by means of a brief, were soon after enabled to rebuild their houses in a more substantial manner.

East Teignmouth is situated near the above, and was formerly a borough, which disputed its antiquity with Exeter.

On the other side of the Teign, in the road between Newton-bushel and Exeter, is Chudleigh, a market-town, one hundred and eighty-two miles from London. Here is a manufacture of serge, and a market, pretty well frequented, on Saturday; and two annual fairs, one on the eleventh of June, for sheep; and the other on the twenty-first of September, for black cattle. The bishops of Exeter had a sumptuous palace here before the reformation, built by one of those prelates in the reign of Edward III. "That," as the bishop expresses it in his

will, "his successors might have a place to lay their heads, if the king should seize their temporalities."

The city of Exeter, which we next visited, is situated on the river Ex, one hundred and seventy-two miles from London. It was incorporated by king John, and made a county of itself by Henry VIII. It is governed by a mayor, twenty-four aldermen, four bailiffs, a recorder, a chamberlain, a town-clerk, and four stewards. At all public processions, the magistrates are attended by a sword-bearer, carrying a sword given by Henry VII. four serjeants at mace, and four staff-bearers. The mayor and officers hear, try, and determine all pleas and civil causes, with the advice of the recorder, aldermen, and common council of the city; but criminal and crown causes are determined by eight aldermen, who are justices of the peace. Here are also twelve companies of incorporated trades, who, on public occasions, follow the mayor.

Exeter is considered as one of the chief cities of England, both with regard to buildings, wealth, extent, and number of inhabitants. It is two miles in circumference, including its suburbs, and encompassed with a stone wall, fortified with turrets. On the top of the walls is a delightful walk round the city, the spectator having the pleasure of seeing a fine open country, decorated with woods, arable lands, orchards, gardens, villages, and gentlemen's seats. It has six gates, and four principal streets, all centering in the middle of the city, thence called Carfax, a contraction of the old Norman word Quatre-voix, four ways. One of these, called the High-street, is very grand and spacious; the houses, in general, are of the antique form, but erected on a good plan, large, commodious, and not inelegant. This street is full of shops, well furnished, and trade of every kind appears brisk and lively. The bridge over the Ex is of great length, and has houses on both sides, except in the middle, where there is a vacancy. The guild-hall is a stately structure, and decorated with the pictures of general Monk, and the princess Henrietta Maria, youngest daughter of king Charles I. that princess being born here.

In the northern angle of the city, stands Rugemont castle, once the residence of the West Saxon monarch, and afterwards of the earls of Cornwall. It is not very large, but of a square figure, encompassed with a high wall and deep ditch. On the north side of this castle, and which was formerly its counterscarp, is a beautiful terraced-walk, bordered by a double row of fine elms, and extending quite round one quarter of the city. The prospect from thence is enchanting, and equal to any thing of that kind in England. This castle is now greatly decayed, a part of it only being kept in repair, for holding the assizes, quarter-sessions, and country-courts, together with a chapel for divine service.

This city is well supplied with water, partly from springs, and partly from the river Ex. The former is brought in pipes, from fountains in the neighbourhood, to several conduits; among which is one particularly remarkable, situated in the center, where the four streets meet, erected by William Duke, who was mayor in the time of Edward IV. The supply of water from the river is raised by means of an engine, worked by a water-wheel turned by the current. The water is first thrown into a reservoir, raised about twenty feet above the ground, and situated in the highest part of the city, adjoining to the guild-hall; and thence dispersed in pipes to the different parts of the city; so that every inhabitant of the principal streets may have the water laid into his own house.

Exeter is the see of a bishop, removed hither from Crediton by Edward the Confessor, who, with his queen Editha, enthroned Leofric in this cathedral in the year 1050.

The cathedral, which is dedicated to St. Peter, is a very curious, magnificent, and elegant structure, though the different parts of it were built at different times, during a period of above three hundred years: for Robert Warlewast, who was consecrated bishop of Exeter in 1150, built the choir; Peter Quivil, who filled the see in 1280, erected the body of the church; John Grandison, consecrated in 1327, built the two last arches at the west end, and covered the whole roof; and Peter Cour-

tenay, bishop of this see, and afterwards translated to Winchester, finished the north tower in 1485. Yet, notwithstanding this, the whole forms one uniform structure, and appears as regular as if begun and finished by one and the same architect. The whole edifice, which is vaulted throughout, is three hundred and ninety feet long, and seventy-four broad. In one of the towers is a very large bell, weighing sixty hundred weight; and in the other, a ring of ten large bells. The organ is very remarkable, being supported by a tetrastyle of very beautiful Gothic columns; and the large pipes in the instrument are fifteen inches diameter, and of a proportional height.

The most remarkable piece of antiquity in this cathedral, and which is, perhaps, equal to that of the see itself, is the bishop's throne in the choir. At the dissolution of episcopacy at the end of the reign of Charles I. it was removed; but such care taken of the several parts, that it was afterwards replaced, without any apparent defect in the whole. The Gothic carvings about the canopy are very curious, and at least sixty feet high; and the whole workmanship is executed in a masterly manner.

The ancient monuments that more particularly deserve attention, are those erected to the memories of Humphry Bohun, earl of Hertford; Hugh Courtenay, earl of Devon, and his lady; lord Chichester; Sir Peter Carey; Sir Thomas Specke; Sir Richard Stapleton; the bishops Leofric, Stafford, Beanscombe, Oldham, Bradbridge, Lacy, Carew, and others, particularly that of bishop Stapleton, founder of Exeter college, in Oxford; and that society, some years since, in grateful remembrance of their benefactor, repaired and beautified this monument, which, with regard to some of the carvings, is, perhaps, equal to any thing of so old a date, executed in the Gothic manner.

The altar-piece, painted above one hundred years ago, is a perspective view of the inside of the cathedral, finely executed: it received some injury from the swords of the parliament's party in the time of the last civil war; but, in all other respects, it is very well preserved. Nor did the painted glass, with which the windows are decorated, escape the fury of the same pious reformers, who, after taking possession of this edifice dedicated to religion, broke great part of these paintings, and irretrievably ruined all the pieces of scripture history there represented. The statues of the patriarchs, prophets, kings, &c. of which there were many, were also objects devoted to destruction by their enthusiastic zeal; and several of these mutilated figures are still to be seen.

On the south side of the high altar are three seats, or alcoves, adorned with carvings in the Gothic manner, twenty-five feet high, supported by brass pillars. These alcoves were erected by Edward the Confessor, for enthroning Leofric, the first bishop of this see.

The four dignitaries of this cathedral are the dean, chantor, chancellor, and treasurer; and to these are added the four archdeacons of Exeter, Totness, Barnstaple, and Cornwall. The houses of the dean and chapter are erected in a circuit near the cathedral, called the Close, from its being inclosed, and separated from the city by walls and gates. Within this inclosure are two churches for the service of the cathedral.

Besides the cathedral, there are twenty parish churches within the city and its liberties. The church of St. Paul is a modern structure, but has nothing remarkable.

In the city and suburbs are prisons, both for debtors and malefactors; a work-house, several alms-houses and charity-schools; and in the year 1701, an hospital was founded here, for the sick and lame poor of the city and county, upon the model of the infirmaries of London and Westminster. The building is very well adapted to the intended purpose, and near three hundred feet in length.

We have already observed, in describing the inland navigation of Devonshire, that the river Ex is made navigable to this city, and that ships of one hundred and fifty tons may load and unload at the quay. This has greatly increased the foreign commerce of this place; and the great number of woollen manufactures established in the city, and its neighbourhood, have rendered it very populous, and its traders very rich, it being computed,

that their traffic in ferges, perpetuanas, long-ells, druggets, kerseys, and other woollen goods, amounts to six hundred thousand pounds a year at least.

Here are three weekly markets, held on Wednesday, Friday, and Saturday; two for provisions, and one for woollen-yarn, kerseys, and serge. The latter was established by Henry VIII. In this market, said to be the greatest in England, except the Brigg-market at Leeds in Yorkshire, the value of the ferges frequently sold in one day, amounting to sixty, eighty, or a hundred thousand pounds; for besides the vast quantities of woollen goods shipped for Portugal, Spain, and Italy, the Dutch send large commissions for purchasing ferges, perpetuanas, and other kinds of woollen stuff, for Holland and Germany.

Besides the above markets, here are four annual fairs, held on Ash Wednesday, Whitsun Monday, the first of August, and the sixth of December, for the sale of black cattle, horses, and almost every commodity; but that on the first of August, generally called Lammas fair, is by far the greatest, being frequented by mercers, haberdashers, &c. from London; it lasts three whole and two half days.

This city sends two members to parliament, elected by the magistrates and freemen, who are said to amount to twelve hundred at least.

Exeter was, for some time, under the jurisdiction of the Romans; but, on their leaving England, the Saxons drove out the Britons, obliged them to retire into Cornwall, and surrounded the city with a ditch, and a stone wall. The Danes sacked it in the year 875; and afterwards, to revenge the general massacre of their countrymen by the English, Swain, one of their kings, came hither, with a powerful army, put the men to the sword, ravished the women, massacred the children, burnt the city, and demolished the walls.

A considerable time after this, but before it had entirely recovered from its deplorable situation, William the Conqueror besieged and took it. Afterwards, it was again besieged in the reigns of king Stephen and Edward IV. Perkin Warbeck also blocked it up, and battered the walls in a furious manner. The inhabitants, however, defended the place with so much resolution, that he was obliged to raise the siege. This gallant behaviour of the citizens was so agreeable to Henry VII. that he came hither in person, and presented to the city a cap of maintenance, together with the sword he then wore, in order to its being carried before the mayor. In the month of July 1544, it was smartly cannonaded by the rebellious commons of Cornwall and Devonshire, who also broke down the bridges, and cut off the water, in order to force the inhabitants to surrender: but they were mistaken; the citizens defended themselves with the utmost bravery, till they were relieved by John lord Russell, who forced the rebels to raise the siege on the sixth of August. The queen of king Charles I. was here delivered of Henrietta, afterwards dutchess of Orleans, this city being garrisoned by the royal party, till they were obliged to surrender to lord Fairfax upon articles. When the prince of Orange landed at Torbay, a detachment of soldiers were sent to take possession of this city: they were received but coldly by the inhabitants; and, though they knew themselves incapable of making any resistance, and were fully sensible of the danger they were in from arbitrary power, yet they were unwilling to join in any attempt that might be construed a rebellion to their lawful prince. In a word, the city of Exeter, by constantly adhering to its motto, *Semper fidelis*, has been applauded by all historians for its inviolable fidelity to its sovereigns, whether they held the crown by hereditary or parliamentary right.

Exeter, from the great number of monks in the city, was called Monkton by the Saxons; and there is no doubt, but a city so famous as this was in the times of the Romans, Britons, and Saxons, must have many religious societies, both of men and women, soon after the conversion of the country to christianity; but the silence of our historians renders the account of the old religious houses here very imperfect. It is not certain, whether this was the seat of the famous monastery of Adestan-cestre, in which St. Boniface, the apostle of the Germans,

mans, who was born at Crediton, in this county, received his education under abbot Wolfherd, about the year 690. But however that be, we are told, that within the precincts of what is now called the Close, there were no less than three religious houses; one was a nunnery, now the deanery house; the second a house of monks, imagined to have been built by Ethelred in the year 868; and the third a monastery of Benedictine monks, founded in 932 by king Athelston, who dedicated it to the Virgin Mary and St. Peter, and endowed it with twenty-six villages. The monks, however, soon deserted this monastery, for fear of the Danes; but they were replaced by king Edgar in 968. They were again forced to fly, upon the devastation of the city and country by the Danes in 1003, and again restored by king Canute, who confirmed their lands and privileges in 1019; but, upon the translation of the episcopal see from Crediton to this city in 1050, only eight monks were remaining in this monastery, and these were translated to Westminster Abbey by Leofric, who placed regular canons in their stead. The chapter of the cathedral, which consists of a dean and twenty-four prebends, was not fixed till the year 1225; and, at the dissolution of monasteries, the revenues of this bishoprick were valued at one thousand five hundred and sixty-six pounds, fourteen shillings and sixpence *per annum*.

The church of St. Olave, in this city, was given by William the Conqueror, or, as some say, by his son, William Rufus, together with some lands adjoining, to the abbey of Battel, in Suffex; and not long after, a priory of six Benedictine monks, dedicated to St. Nicholas, was built upon this foundation, the yearly revenues of which, at the dissolution, were valued at one hundred and forty-seven pounds twelve shillings.

The old collegiate church, or free chapel, for four prebendaries, in the castle of this city, dedicated to the Virgin Mary, was given by William Avenell to the priory of Plympton, in the reign of king Stephen.

Baldwin de Riveris, earl of Devonshire, gave, some time before the year 1146, the chapel of St. James, situated without the walls of this city, together with its tythes, and other estates, to the head monastery of St. Peter at Cluny, in France, and to the abbey of St. Martin de Carpis, near Paris, on condition that a prior, with a certain number of monks of the same order, might be settled here; this was accordingly done, and it became subordinate to the abbey of St. Martin de Carpis; but, as it was an alien priory, its revenues were often seized by the kings of England, when they were at war with France, and at last totally suppressed. It was, however, after its suppression, as an alien priory, made part of the endowment of King's College in Cambridge, by Henry VI.

Without the south gate of this city, there was a lazaret-house, dedicated to St. Mary Magdalen; for in the year 1163, bishop Bartholomew Iscanus made an addition to its revenues.

Gilbert and John Long, merchants of Exeter, were considered as the founders of a priory, or rather an hospital, dedicated to St. John the Baptist, and erected about the year 1239, just within the east gate of this city. It was of the order of St. Augustine, consisted of five priests, nine choristers, and twelve poor; and, at the dissolution, was valued at one hundred and two pounds, twelve shillings and nine-pence *per annum*.

On the north side of the cathedral was a house of Dominican, or preaching friars, built in the reign of Henry I. and, at the dissolution, was granted to John lord Russell, ancestor to the duke of Bedford, and is now called Bedford-house.

In a plain called Freren Hay, situated between the north and west gates of this city, was a house of Franciscan friars; but they were removed, in the time of Edward I. by bishop Buton, to a house he had erected for these mendicants, without the south gate, where they continued till the dissolution.

Here was also formerly an alms-house, for twelve poor men, and the same number of poor women, and called *Fratres Calendarum*: but this house was converted into a college for the vicars-choral of this cathedral, in the

fourteenth century, by John Grandison, bishop of Exeter. These vicars were afterwards incorporated, and had, at the time when the monasteries were dissolved, a clear revenue of two hundred and four pounds, nineteen shillings and threepence *per annum*, which was divided among them; they were twenty in number.

About a mile and a half without the east gate of Exeter, is the parish of Heavy Tree, so called from the gallows erected there for malefactors; and near it is the place where these criminals are buried, purchased for that purpose, in the reign of Edward VI. by the widow of Mr. Tuckfield, sheriff of Exeter: she also left a sum of money to buy them shrouds.

Leaving the city of Exeter, we proceeded, through a very pleasant road, to Topsham, the port town to Exeter, about three miles distant from that city, and one hundred and seventy-five from London. It is a populous town, almost encompassed by the Ex, and a small stream called the Clift. It has a weekly market, very well frequented, on Thursday; and a pretty large fair for cattle, &c. on St. Margaret's day.

About a mile below Topsham, on the other side of the river Ex, is a very fine antique seat, called Powderham-castle, the seat of the Courtenay family, descended from the earls of Devon of that name. It was built by Isabella, daughter of Baldwin de Redveris, and widow of William de Fortibus, in the reign of Henry III. It is constructed in the form of a castle, and justly considered as one of the grandest pieces of antiquity in this county.

From Topsham we directed our course towards the sea-side, and crossed the river Otter at Otterton Bridge, a small village, where there was formerly a cell to a monastery in Normandy; but afterwards, in the reign of Henry IV. it was given to the abbey of Sion. At the dissolution, one Richard Duke procured the manor, which has since continued in a layman's hands.

Sidmouth is a small town, situated at the mouth of a little river, called the Side, which once formed a considerable harbour for ships; but while the manor continued to be the property of the abbey of Sion, the entrance was so choaked up with sand, that all attempts to improve it have proved abortive: it is, however, still one of the principal fishing-towns in the county, and coasting vessels of small burden often put in here, when overtaken by contrary winds or stormy weather.

Ottery St. Mary's was the next town we visited. It is situated on the river Otter, about seven miles above its influx into the sea, and one hundred and sixty-one from London. It is a large town, and belonged formerly to St. Mary's, a monastery in Normandy; but afterwards purchased by Grandison, bishop of Exeter, who, in the tenth year of the reign of Edward III. made it a quarter college, placing therein secular priests, and other ministers, to whom he gave the whole manor, parish, tythes, fines, spiritual profits, &c. which amounted to three hundred and four pounds, two shillings and ten-pence *per annum*.

The church is an old and venerable structure, and has several antique monuments; but their inscriptions so defaced, that they are not legible. The windows are both small and low, and the glass so loaded with the arms of various benefactors, that the church is dark, and has thence a very gloomy appearance.

The weekly market, which is on Tuesday, is pretty well frequented; and the annual fairs, which are held on the first Tuesday se'ennight before Easter, and the Tuesday in Whitfun-week, are for the sale of cattle.

Honiton is a borough town situated on the river Otter, five miles above Ottery St. Mary's, and on the high road to Exeter, one hundred and fifty-six miles from London. The country round this town, and even as far as Exeter, is remarkably fruitful, and presents the spectator, from the hill near Honiton, with one of the finest landscapes in the world. The town is large, populous, and well built, consisting principally of one large street, remarkably well paved with small pebbles, on each side of which runs a little rill of pure water, with a square dipping-place at each door. At the extremity of this street is a good stone bridge over the Otter. About half a mile from the town, is the parish church, situated on the summit

summit of a hill, the declivity of which being difficult and troublesome to ascend on foot, the gentry used to go to church on horseback, or in coaches, and stables were accordingly built near the church-yard for the reception of their horses; but the church has not been so much frequented since the year 1743, when a new chapel was erected in the town. A charity-school for thirty boys was opened here at Christmas 1733.

On the nineteenth of July 1747, a sudden and dreadful fire broke out in this town, and continued raging, with the utmost violence, till four the next morning, whereby near three quarters of the town were reduced to ashes, notwithstanding the conveniency of water already mentioned; for the calamity happened so sudden, and the flames were so violent, augmented by a high wind, that the fire extended its ravages several ways at once, to the utter ruin of many hundreds of the poor labouring inhabitants, very few being able to save any part of their effects, or even their working-tools, on which their subsistence depended. The loss amounted to above forty-three thousand pounds.

The first serge manufacture in Devonshire was established in this town, and there are still very considerable works of that kind; but many of the inhabitants are employed in a manufacture of lace, which is made here of a greater breadth than in any other part of England. Here is a well frequented-market on Saturday: and an annual fair for the sale of cattle, &c. on the first Wednesday after the nineteenth of July.

About a quarter of a mile out of town, in the road to Exeter, stands an hospital with a handsome chapel, originally founded and endowed for four lepers, by one Thomas Chard, an abbot. At present the patients are admitted by the rector, churchwardens, and overseers of the parish; and by a regulation made in the year 1664, other poor patients are admitted as well as lepers.

Axminster was the next place we visited in our survey of Devonshire. It is situated in the great road to Exeter, on the river Ax, near the borders of Dorsetshire, one hundred and forty-six miles from London. It has its name partly from its situation on the river Ax, and partly from a minster established here by king Athelstan, who endowed it for the maintenance of seven priests, to pray for the souls of persons slain in a battle near this place by the Danes. These disturbers of the public repose landed near the mouth of Ax, whence they marched to a place called Kingsfield, near this place, where they were met by king Athelstan's army, commanded by himself in person, having under him two dukes, and the bishop of Sherburne. A terrible battle ensued, in which six thousand of the Danes were killed on the spot, and great numbers wounded; and the rest obliged to repair to their ships with the utmost precipitation. Nor was the battle gained without loss, by the English; for besides a great number of soldiers, two dukes, and the bishop of Sherburne were killed, and buried in the minster erected by king Athelstan, in memory of this victory. Their monuments are still to be seen in the church, placed under arches, two of which have been lately filled up.

It is a considerable town, the streets clean, and many of the houses well built; a considerable trade is also carried on here in kerseys, druggets, and other articles of the woollen manufacture; the town is also well supplied with provisions, especially fish, which are sent in great quantities from the sea coasts in its neighbourhood.

Here is a weekly market on Saturday, and three annual fairs, viz. on St. Mark's day; twenty-fifth of April; first Wednesday after the twenty-fourth of June, and the first Wednesday after the twenty-ninth of September; all principally for the sale of cattle.

In the neighbourhood of this town lies Ford-abbey; formerly a stately fabric, lofty, and very magnificent; adorned with curious carvings and embellishments in the Gothic taste; some of these decorations still remain, together with a considerable part of this ancient structure. It was founded by Adeliza, daughter of Baldwin de Briouisi, baron of Oakhampton, in the year 1140, and dedicated to the Virgin Mary, for Cistercian monks. At the dissolution of monasteries it was valued at three hundred and eighty one pounds, ten shillings, and eight pence half-penny per annum.

The manor of Axmouth, situated at the mouth of the Ax, about eight miles below Axminster, was given to the abbey of St. Mary's at Mountborow, in Normandy, by Richard de Redveris, earl of Devonshire, in the time of Henry II. and sometimes reckoned as a distinct alien priory; at others, as part of the estate of the Lodors, a priory near Bridport in Dorsetshire; but this priory of Lodors was itself a cell to the monastery of Mountborow. After the dissolution of foreign religious houses, Axmouth was bestowed upon the monastery of Sion; and was so much neglected, that the harbour, formerly capable of receiving ships of burden, was so choaked up with sand, that when Henry VIII. at the dissolution, gave it to Walter Earl, Esq; it was found impracticable to remove the sand-banks.

Columpton, the next town we visited, is situated on the river Columb, one hundred and sixty-six miles from London. It is a pretty large town, and has a spacious church, the roof of which is curious and richly gilded, and still preserved as an ornament, though the image worshipped in the time of popish superstition has been long removed. This town has a very considerable trade, and the woollen manufacture carried on here employs a number of people. It has a weekly market on Saturday; and two annual fairs for the sale of cattle; viz. the first of May and twenty-eighth of October.

Crediton, or as it is vulgarly called Kirton, stands on the river Kredon, one hundred eighty-three miles from London. In the Saxon times it was the see of a bishop, and which was afterwards translated to Exeter. The cathedral, which is still standing, continued long after the removal of the see, a collegiate church, under the patronage of the bishop of Exeter, and at the dissolution was valued at three hundred and thirty two pounds, seventeen shillings and six-pence, *per annum*.

On the fourteenth of August, 1743, a terrible fire broke out in this town, which, in less than ten hours consumed four hundred and sixty dwelling houses, besides the market house, wool chambers and other public buildings; eighteen persons perished in the flames; more than two thousand were reduced to the most deplorable distress, and the damages in houses and goods not insured, were computed at sixty thousand pounds. Since this disaster the town has in a great measure recovered itself, and the houses are built in a much more regular manner than before. The trade of this place, which is very considerable, consists in the woollen manufacture, by which the greater part of its inhabitants are employed. Here is a charity-school, a weekly market on Saturday, and three annual fairs for the sale of cattle, viz. the eleventh of May, the twenty-first of August, and the twenty-first of September.

About five miles west of Crediton, lies Bowe, a small market town, said to have its name from its crookedness. It is one hundred and eighty seven miles from London, and the dutchy court of Lancaster is commonly kept here. It has a small market on Thursday, and two annual fairs, viz. on Holy Thursday, and the twenty second of November; both for the sale of cattle.

Moreton, or Moreton-Hampstead, is a market-town, irregularly built, but has a considerable manufacture of serge. It is situated in the forest of Dartmore, a place formerly famous for its tin-mines, one hundred and seventy nine miles from London. This forest is very extensive, being twenty-miles in length, and fourteen in breadth. Near one hundred thousand sheep are pastured here every summer, besides a proportional number of black cattle; but in the winter it exhibits a dreary prospect, and the roads are hardly passable. On the top of one of the hills on the borders of this forest, is a remarkable plain, nearly of a circular form, and almost a mile in diameter, full of little springs, which often cover the whole plain with water, and form many small rivulets trickling down the sides of the hill. And near this hill are two very high cliffs, called Æther rocks, from whence there is a very extensive view of Torbay, and the country for several miles round; about a quarter of a mile from these cliffs, is a large heap of rocks, and among them one about eight feet long, two broad, and three and half thick, so equally poised as to be easily moved up and down with the little

finger

finger only. There are several of this kind in Cornwall, as we have already observed in our survey of that county, where they are called logan or rocking-stones.

Moreton has a small market on Saturday; and four annual fairs, viz. the first Saturday in June, the eighteenth of July, St. Andrew's day, and the thirtieth of November, all for cattle.

About three miles to the west of Moreton, lies Chegford, remarkable for being one of the stannary towns, but a very poor, inconsiderable place. Perhaps it was in a more flourishing condition when the tin-mines in this forest were properly worked. It has still four annual fairs, viz. the twenty-fifth of March, the fourth of May, the twenty-ninth of September, and the twenty-ninth of October, all for cattle.

Okehampton, vulgarly called Ockington, which we passed through in our route from Bowe to Tavistock, is situated on the river Oke, one hundred and ninety-three miles from London. It is an ancient borough and barony, governed by a mayor, eight capital burgeses, and as many assistants, a recorder, a justice, and a town-clerk. The mayor has a principal part in the election of a successor, it being his province to nominate two persons among the burgeses, one of which is elected mayor by the burgeses, and their assistants. Here is a town-hall, and a chapel, but both very mean buildings; though one Trelawney, in the reign of James I. added a small neat tower to the chapel, which gives it the form of a church. The mother church stands on the top of a hill, a mile from the town; and near it are the ruins of a castle, erected in the reign of William the Conqueror. It sends two members to parliament, and has a considerable manufacture of ferges, by which the poorer sort of the inhabitants are maintained; but its principal support is the road between Launceston, in Cornwall, and Crediton; and accordingly, the best houses in the town are inns. It has a market on Saturday; and four annual fairs for the sale of cattle, viz. the second Tuesday after the eleventh of March, the fourteenth of May, the first Wednesday after the fifth of July, and the fifth of August. But it must be remembered, that if both, or either of the fairs of the fourteenth of May and fifth of August, fall on a Sunday, the fair is held on the Tuesday following.

Bearlston, Beralston, or Boralston, is a small town, situated on a little river called the Taw, three miles from Tavistock, and two hundred from London. It is an ancient borough by prescription, and governed by a portreve, who is chosen annually. All persons who pay three-pence or more a year to the lord of the manor, as an acknowledgment of land held in the borough, are called burgage-holders, and are the only voters for representatives in parliament, who are returned by the portreve. This place, however, though it sends two members to parliament, is only a hamlet to Bearferis, and lies near two miles from its parish church. It did not send members to parliament till the twenty-seventh year of the reign of queen Elizabeth, when many other mean places were favoured with the same privilege. It consists of about an hundred ordinary houses, but has a small manufacture of ferges. It has a weekly market on Thursday, but no annual fair.

Tavistock, or Tavestock, is a pretty large town, situated on the banks of the Tave, two hundred and one miles from London. It is an ancient borough by prescription, having sent members to parliament ever since the reign of Edward I. It was never incorporated, but is governed by a portreve, chosen annually on Michaelmas day, by twenty-four freeholders, at the court of the lord of the manor. It is one of the stannary towns, well built, and has a handsome parish church, covered with slate. It has two alms-houses, and a flourishing manufacture of ferges. Here are still some stately ruins of its famous abbey, begun by Ordgar earl of Devonshire, in the year 961, and finished by his son Ordulf. It was dedicated to the Virgin Mary and St. Rumon, and its abbots were barons in parliament. At the dissolution of monasteries, it was endowed with nine hundred and two pounds, five shillings, and seven-pence *per annum*. Several books were printed here in the old Saxon, and a school established for teaching that language.

Here is a stone bridge over the Tave, called Guile-bridge, of which the following account has been handed down by tradition. One Childe, owner of the manor of Plymstock, gave, by will, those lands to the church where his body should be buried. Soon after, being hunting in the adjacent forest, he lost both his companions and his way; in this forlorn condition he wandered for some time, till the piercing severity of the weather obliged him, as his last resource, to kill his horse, in order to screen himself from the cold in the belly of the animal; but this soon failing, he perished. After some search, the body was found by the inhabitants of Tavistock, and by them carried away towards their abbey, in order for interment; but the people of Plymstock, unwilling to lose so rich a legacy, lay in ambush for them at a bridge, over which they apprehended the others must pass with the body. In this, however, they were deceived; the religious of the abbey, to secure so considerable a revenue, built a slight bridge on purpose, over the Tave, in the place where the other now stands, and over this temporary bridge the body was conveyed to the abbey, and there interred.

Tavistock has a weekly market, well frequented, on Friday; and five annual fairs for the sale of cattle, viz. the seventeenth of January, the sixth of May, the ninth of September, the tenth of October, and the eleventh of December.

Near this town is Buckland priory, founded by Amicia, daughter of Gilbert de Clare, earl of Gloucester, and wife of Baldwin de Redveris, earl of Devon. It was dedicated to St. Mary and St. Benedict, and filled with monks from the Isle of Wight, in the year 1278. At the dissolution, it was valued at two hundred and forty-one pounds, seventeen shillings and nine-pence *per annum*, and given to Sir Richard Greenvile; but, in the reign of queen Elizabeth, it became the possession of the famous Sir Francis Drake, and in that honourable family it has ever since continued. We have given a perspective view of this priory on the copper-plate annexed.

In the church of Lamberton, two miles S. W. of Tavistock, are the effigies of Nicholas and Andrew Tremaine, twins, born in that parish. The features, stature, voice, and every other particular of these persons, so exactly resembled each other, that those who knew them best could not always distinguish them. But this similitude of person, however uncommon, was less wonderful than the sympathy which subsisted between them; for, even at a distance from each other, they performed the same functions, had the same appetites and desires, and suffered, at the same time, the same pains and anxieties. Nothing farther is related of these remarkable persons, except that, in the year 1663, they were both killed together at Newhaven, in France; but in what manner, or on what occasion, is not known.

After viewing Tavistock, and the most remarkable places in its neighbourhood, we directed our course to the northward, and passed through Lidston, a market-town in Mr. Camden's time; but the market is now disused, and the town has nothing to engage the attention of a traveller.

Houlsworth is situated near the borders of Cornwall, on a brook that falls into the river Tamar, one hundred and ninety-four miles from London. It has a manufacture of ferges, a market on Saturday, and three annual fairs for the sale of cattle, viz. the twenty-seventh of April, the tenth of July, and the second of October.

Hatherly is a small market-town, situated on a branch of the river Touridge, near its conflux with the Oke, one hundred and ninety-four miles from London. The manor formerly belonged to Tavistock Abbey, but has been in lay-hands ever since the dissolution of religious houses. Here is a weekly market on Friday; and four annual fairs, viz. the twenty-first of May, the twenty-second of June, the fourth of September, and the eighth of November, for the sale of cattle.

Chimley is a small market-town, situated on the river Tave, about mid-way between Exeter and Barnstaple, one hundred and eighty-four miles from London. Here was once a free-school, founded by the earl of Bedford, but has long since come to nothing. It has a small market on Thursday, but no annual fair.

Tiverton was the next place of note we visited. It stands between the rivers Ex and Loman, and has a stone bridge over each of these streams. Before these bridges were built, there were two fords here, one over each of the above rivers, and hence the town was called Twyfordton, the town upon two fords, and thence, by abbreviation, Tiverton. It is the greatest manufacturing town in this county, Exeter only excepted: it is also very populous, wealthy, and all the inhabitants employed.

Tiverton sends two members to parliament, and is governed by a mayor, twelve principal burgessees, and twelve inferior burgessees, or assistants, a recorder, and a town-clerk of the peace. The mayor, by the charter of incorporation, which was granted by James I. is gaol-keeper, and accordingly the gaol-delivery is always held before him and the recorder.

This town has been remarkable for its sufferings by fire. On the third of April 1598, being market-day, a fire broke out, about one in the afternoon, in the west part of the town; and burnt with such violence, that the whole place, consisting of above six hundred houses, was consumed, the church and two alms-houses only escaping the fury of the flames. It was hardly rebuilt, when it was again totally destroyed by fire, on the fifth of August 1612; but the church and alms-houses were again preserved. On the fifth of June 1731, another terrible fire happened here, which destroyed two hundred of the best houses in the place, together with most of the manufactures. The loss, upon this occasion, was computed at one hundred and fifty thousand pounds. The year following, an act of parliament passed for rebuilding the town, by which it was enjoined, that the new built houses should be covered with lead or tile instead of thatch; that no trade likely to occasion fires should be exercised in the public streets, nor any stacks of corn, straw, or hay, erected there; that fire-engines should be provided; that houses should be demolished to stop any future fire; and that particular houses should be pulled down, for widening the streets and other passages.

The succeeding year, viz. 1733, another act was passed for making a chapel, built by the subscription of the inhabitants of Tiverton, a perpetual cure, and for providing a maintenance for the ministers who shall officiate in it; for, as the preamble to the act observes, the parish-church was far from being sufficiently capacious to receive the inhabitants of the parish.

But the glory of Tiverton is the free-school, situated at the east entrance of the town; a noble building, but a much nobler foundation. It was erected by one Peter Blondel, a clothier, and a lover of learning. He often used the saying of William of Wickham to the king, when he founded the noble school at Winchester: "If I am not myself a scholar, I will be the occasion of making more scholars than any scholar in England." Mr. Blondel has endowed this school so liberally, that the master has at least sixty pounds a year, besides a very good house to live in, and the advantage of scholars not on the foundation. The usher has likewise a proportional salary. This generous founder also laid out two thousand pounds in the purchase of lands, to maintain six scholars at Oxford and Cambridge, to be elected out of the scholars of this school. There are now eight, and placed at Baliol college in Oxford, and at Sidney college in Cambridge. He also left an allowance for a yearly feast on St. Peter's day, in remembrance of him.

This school is the principal nursery for the young gentlemen in these western parts of the kingdom. At the same time, the profits arising from boarders, and the liberal benefactions of parents, added to the salary settled by the founder, render this preferment worthy the acceptance of a person celebrated for his parts and learning; and, as the trustees are gentlemen of the strictest honour, it is generally disposed of to the most worthy candidate.

In the church of this town was formerly a chapel, built by the earls of Devonshire, for their burial-place. In this chapel, which is now demolished, there was a monument erected to the memory of Edward Courtnay, earl of Devonshire, and his countess; with their effigies in alabaster, richly gilt, and the following inscription:

Ho, ho, who lies here?
'Tis I, the good earl of Devonshire,
With Kate, my wife, to me full dear:
We liv'd together fifty-five year.
That we spent, we had;
That we left, we lost;
That we gave, we have.

Tiverton sends two members to parliament; has two weekly markets, held on Tuesday and Saturday; and two annual fairs for the sale of cattle, &c. the first is held on the Tuesday fortnight after Whitsunday, and the second on the tenth of October; but if the latter happens on a Sunday, the fair is kept the Tuesday following.

At Legh, a village a little to the north-west of Tiverton, Walter Clavell, in the reign of Henry II. founded a monastery for canons of the order of St. Augustine, who were changed by Maud de Clare, countess of Hereford and Gloucester, in the beginning of the reign of Edward I. into an abbey of nuns, or canonessees of the same order. It was dedicated to the Virgin Mary, St. John the evangelist, and St. Etheldreda; and valued, at the dissolution, at which time there were about eighteen religious in this monastery, at one hundred and ninety-seven pounds, three shillings and a penny *per annum*.

Bampton, or, as it is vulgarly called, Baunton, both being corruptions of Bathampton, is a small market-town, situated in a bottom encompassed with hills, on a branch of the river Ax, one hundred and sixty miles from London. It formerly sent members to parliament, but that privilege has been lost many years. It is, however, still governed by a portreve, chosen annually, and has a flourishing manufacture of serges, a good market on Wednesday, and two annual fairs, viz. on Whitsun-Tuesday, and the twenty-fourth of October, both for the sale of cattle.

South Moulton was the next town we visited. It stands on the river Moul, and has the epithet South, to distinguish it from North Moulton, situated on the same stream, a few miles farther to the northward. It was anciently a royal demesne, and was at last purchased by the corporation of queen Elizabeth; and they are now lords of the manor, paying a certain fee-farm rent to the crown.

South Moulton is one hundred and eighty-three miles distant from London, was once a borough town, and sent members to parliament in the reign of Edward I. It is governed by a mayor, eighteen capital burgessees, a recorder, town-clerk, and two serjeants at mace. It has a noble and spacious church; a charity-school, where thirty boys are taught and clothed by subscription; and a free-school, which was built and endowed in the year 1684, by a native of the place, but a merchant of London. The chief manufactures of this town are serges, shalloons, and felts; and great quantities of wool, brought from different parts of the country, are bought up here every Saturday, that being the weekly market. But there are two Saturdays in the year, when the markets are much larger than at other times, being then furnished with different sorts of cattle, wares and merchandize, viz. the Saturday after the thirteenth of April, and the Saturday before the first of May. There are also here four annual fairs for the sale of cattle, held on the Wednesday before the twenty-second of June, the Wednesday after the twenty-sixth of August, the Saturday before the tenth of October, and the Saturday before the twelfth of December.

From South Moulton we passed on to Barnstaple, a large borough town on the river Taw, one hundred and ninety-four miles distant from London. It is pleasantly situated among hills, in the form of a semicircle, the river being the diameter. It is an ancient borough by prescription, ever since the twenty-third year of the reign of Edward I. The streets are clean and well paved, and the houses built of stone. It was formerly walled, defended by a castle, and enjoyed the privileges of a city; but these privileges being lost, it was incorporated by queen Mary, and is governed by a mayor, twenty-four common council-men, of whom two are aldermen, a high steward, a recorder, a deputy recorder, and other officers.

officers. It has a stately stone bridge over the river Taw, built, according to some writers, by one Stamford, a merchant of London; but, according to others, by the inhabitants, from the profits of the ferry; except three of the piers, which were erected by subscription of the maidens of Barnstaple.

The river Taw was formerly deep enough to bring up ships of great burden to the key at Barnstaple; but the navigation is now so greatly injured, by a vast number of sand-banks, extending, in several places, quite across the river, that only ships of small burden can now come up to the quay. This has greatly lessened the trade of Barnstaple, though it is still very considerable, especially to America and Ireland, it being an established port for the importation of wool from the latter. It has also a very considerable trade with the clothiers of Tiverton and Exeter, who come hither to purchase fish, wool, and yarn, great quantities of the latter being spun in the town and its neighbourhood. Here are two charity-schools, one for fifty, and another for thirty girls.

We have already observed, that the navigation of the river is greatly impeded by sand-banks; these not only prevent ships of burden from coming up to Barnstaple, but also impede the current of the river; by which means the waters swell so high on spring-tides, that the adjacent meadows are overflowed; and the town itself appears, to a spectator on the neighbouring hills, to be situated on a peninsula.

Here are still some remains of the ancient castle, which, some say, was built by king Athelstan; and others, by one Indael of Totnes. In the eastern part of the town was a religious house, erected by Joel, son of Alured, earl of Brittany: it was dedicated to St. Mary Magdalen, for monks of the Cluniac order; and the founder himself intended to have spent the latter part of his life among them, but was prevented by death. This monastery was, for some time, a cell to St. Martin's in the Fields, near Paris; and, at the dissolution, at which time one Robert Thorn was prior, it was valued at two hundred and twenty-three pounds, six shillings and sevenpence *per annum*.

Barnstaple has a large weekly market on Friday; and four annual fairs, viz. the twenty-ninth of September, the Friday before the twenty-first of April, and the second Friday in December, all for the sale of cattle. The two latter are indeed rather large markets than fairs, there being no charter for holding them.

At Pilton, a village joined to Barnstaple by a bridge over a small stream, called the North-Yeo, was a Benedictine priory, founded by king Athelstan, and dedicated to the Virgin Mary. It was accounted a cell to Malmesbury Abbey, in Wiltshire; and, at the time of the dissolution, consisted only of a prior and three monks, though the yearly revenues were valued at three hundred and thirty-two pounds, seventeen shillings and five-pence.

From Barnstaple we crossed the Taw, over the stone-bridge already mentioned, and directed our route towards Farrington; and, in our way, visited Tavistock-house, the seat of Sir Bourchier Wrey, baronet; and said to be the largest and best finished structure of this kind in the county. From a small hill in the park, there is a view of the best manor, best mansion, and best rectory, in Devonshire.

Near this seat, on the other side of the river Taw, is a small town called Bishops Tauton. It was the first bishop's see in this county, but did not long enjoy that honour; for two bishops only sat here when the see was removed to Crediton, and afterwards to Exeter.

Torrington, or, as it is often called, Great Torrington, to distinguish it from another, but much smaller town, situated in the neighbourhood, but on the other side of the river, is an ancient borough, situated on the Touridge, one hundred and ninety-two miles from London. It sent members to parliament in the reigns of Edward I. II. and III. but not since. It was incorporated by queen Mary, and is governed by a mayor, eight aldermen, and sixteen burgesses. The petty sessions, and other meetings of the gentlemen and justices of this part of the county, are generally held here. It has two churches, one of which is very spacious, has several antique monuments,

and a library belonging to it. Margaret countess of Richmond, mother to Henry VII. lived here for some time, and gave the manor-house, together with the lands belonging to it, to the rector of Torrington, and his successors; for, before that time, the parsonage-house was situated at a great distance from the church. The river Touridge is navigable, for small vessels, to this town, by which means a very considerable trade is carried on to Ireland, Wales, Bristol, and other places. The town is rich and populous, the inhabitants being employed in the woollen manufacture, several branches of which are carried on here. Here is a good stone-bridge over the Touridge; and several alms-houses, whose inhabitants are intitled to a right of commonage on a large piece of waste land called the common, given, for that purpose, by William Fitz-Robert, baron of Torrington, in the reign of Richard I. Here are still some remains of a castle, formerly of considerable strength, and from whence several knights fees were held.

Torrington has a large weekly market on Saturday, for corn, provisions, &c. and three annual fairs for the sale of cattle, held on the fourth of May, the fifth of July, and the tenth of October.

From Torrington we passed over the stone bridge already mentioned, in our way to Hartland, a market-town situated on a promontory, shooting out a considerable distance into the sea, and called Hartland-point, one hundred and ninety-seven miles from London.

Hartland is a populous town, frequented by the people of Cornwall, being situated on the borders of that county; and also by the fishermen of Biddeford, Barnstaple, and other places on the coast; for their vessels find shelter under the rocks near this town, from the south-east and south-west winds; and, when the winds blow too hard for them to venture out, the seamen come ashore here, and purchase provisions. At the same time, Hartland itself has a very considerable share of the herring fishery on this coast, and the cod taken here is said to be the best in the world, though not near so plenty as on the banks of Newfoundland. Some time since, a pier was erected at Hartland, by virtue of an act of parliament obtained for that purpose, and where vessels of considerable burden find shelter in bad weather. There is also a good quay here, but the descent to it is very steep, being cut out of the cliff. The church was formerly famous for containing the relics of St. Nectan, to whom it is dedicated, and still called Stoke St. Nectan. Giltha, the countess of earl Goodwin, built an abbey here, and dedicated it to the above St. Nectan, whom she highly revered, from a persuasion, that by his merits her husband escaped shipwreck in a dangerous tempest. This abbey was delightfully situated in a valley, where some vestiges of the structure still remain. At the dissolution, it was valued at three hundred and six pounds, three shillings and two-pence *per annum*.

Hartland has a weekly market on Saturday; and two annual fairs for the sale of cattle; the first held on Easter Wednesday, and the second on the twenty-fifth of September.

After viewing the town of Hartland, we embarked on board a small fishing-vessel in the pier, and sailed to Lundy island, which lies about eleven miles to the northward of Hartland-point, in the Bristol channel: most writers indeed, by a strange mistake, say, the distance is fifty miles. It is five miles long, and two broad; but so encompassed with inaccessible rocks, that there is only one landing-place, and that so remarkably narrow, that hardly two men can walk a-breast. It had once both a fort and a chapel, but they are now both in ruins. At the northern extremity of the island is a remarkable rock, at some distance from the shore, called the Constable. The soil, in the southern parts of the island, is pretty good, and affords pasture for great numbers of black cattle, horses and sheep: the northern parts are not so fertile, but feed many goats, and plenty of rabbits. It is very remarkable, that though Lundy is entirely separated by the sea, it has several perennial springs of fine fresh water; and the inhabitants affirm, that no venomous creature will live in the island; at least, that there are none at present, nor ever have been any in the memory

of man. Wild-fowl frequent this island in prodigious flocks; and their eggs lie so thick on the ground, at the proper season, that it is difficult to walk without treading upon some of them. In the reign of Henry VIII. one William Morisco having failed in an attempt to murder that prince at Woodstock, fled to this island, which he fortified, turned pirate, and took many vessels in the channel. The island was, however, at last taken by surprise, and Morisco, with sixteen of his accomplices, put to death.

From Lundy we returned to Hartland in the same vessel, and continued our route to Biddeford, a large town situated on the river Touridge, a little above its junction with the Taw, one hundred and ninety-seven miles from London. It is governed by a mayor, aldermen, a town-clerk, serjeants at mace, and other officers; and has a peculiar court, to which civil actions are brought, and determined for any sum. It is a clean, well-built, populous town; and the street, running parallel with the river, is three quarters of a mile in length, decorated with the custom-house, an elegant building; and a noble quay before it, where ships load and unload in the very heart of the town. Besides this, there is another street of considerable length, and as broad as the high-street at Exeter, adorned with good buildings, and inhabited by wealthy merchants.

This town has a large church, and a handsome meeting-house, together with a noble bridge over the river Touridge, built in the fourteenth century, consisting of twenty-four beautiful and stately Gothic arches. The foundation is still very firm, though the structure shakes with the least step of a horse. This edifice was erected by subscription, which was greatly increased by the enthusiastic notions that then prevailed. It seems that various attempts had been made before to erect a bridge over the river, that the many fatal accidents continually happening at the ferry, might, for the future, be prevented; but no firm foundation could be discovered for erecting a structure of this kind. While they were engaged in these fruitless attempts, one Sir Richard Gomer, then priest of Biddeford, was informed in a vision, that a solid foundation would be found near a rock, which he would find rolled from the higher ground upon the strand. In the morning, on visiting the place, he found a prodigious rock upon the sand, which nothing but supernatural power could have placed there. This dream he told to the bishop of the diocese, who immediately issued indulgences, with licence to collect the benevolence of all persons in the bishoprick. This had the desired effect, and multitudes of well-disposed persons contributed liberally towards finishing a work, in favour of which, they were persuaded, heaven had interested itself. By these subscriptions, the undertakers were not only enabled to finish the structure, but also to purchase lands for keeping it in repair. The rents of these lands are still received, and laid out, or otherwise accounted for, by a bridge-warden chosen by the corporation.

The trade of Biddeford is very considerable, both foreign and domestic. Ships of very large burden come up to the quay, so that the merchants are enabled to carry on their business with the West Indies, the colonies on the continent of America, Newfoundland and Ireland, from whence it is an established port for wool, as well as Barnstaple. Between sixty and seventy sail of large ships belong to this port, many of which are employed in the Newfoundland fishery. Besides these, ships are continually sending to Liverpool and Warrington for rock-salt, which they melt here in sea-water, and then boil the brine into a fresh salt: this they call salt upon salt, and use it in curing herrings, which are taken in great quantities in the bays and creeks near this town.

Biddeford has a very good weekly market, held on Tuesday; and three annual fairs for the sale of cattle, viz. the fourteenth of February, the eighteenth of July, and the thirtieth of November.

Near Biddeford, at a place called the Burrows, on the north coast of Barnstaple bay, are an amazing quantity of very large and beautiful pebbles, so regularly veined, and variegated with such elegant colours, that they appear to be the work of art rather than nature. This

bank of pebbles is near three miles long, and of a very considerable breadth and depth: they are as smooth as marble, of an oblong form, and, in general, from six to twenty inches in diameter, the shortest way, and twelve to twenty-four the other.

From Biddeford we passed along the banks of the Touridge, to Appledore, where we crossed the river, and passed on to Ilford-comb, a rich and trading sea-port town, situated at the mouth of a harbour of the same name, one hundred and seventy-eight miles from London. Here is a very good harbour and road for ships trading to Ireland, and other parts of St. George's Channel; and here the merchants of Barnstaple carry on great part of their business. On a southern point of land, at the entrance of the harbour, is a light-house, for the direction of seamen in the night.

The harbour of Ilford-comb was maintained formerly at the private expence of the ancestors of Sir Bouchier Wrey, baronet, lord of the manor. The pier and quay, which is upwards of eight hundred and fifty feet in length, and above forty in depth, the warp-house, light-house, pilot-boats, and tow-boats, belonging to the port, were at first built, and constantly repaired and maintained by that worthy family, without any other assistance than a small acknowledgment paid to them as lords of the manor. But, by length of them, and the violent attacks of the sea, the quay was greatly sunk and impaired; the warp and warp-houses, by long usage, were gone to decay; and the boats used for piloting and towing the ships in and out of the harbour much out of repair; at the same time, the small duties and acknowledgments paid to Sir Bouchier, sinking, and being frequently unpaid, it became necessary to find out some adequate remedy to these disorders. Accordingly, an act of parliament was passed in the year 1731, for repairing and keeping in repair, and enlarging the piers and harbour, and for the support of the light and light-house, the warp and warp-house, and the pilot and towing-boats above-mentioned; so that by this means the harbour of Ilford-comb is likely to continue the useful and convenient port it has been for so many years past, till this kingdom ceases to be a trading nation.

Ilfordcomb is a large and populous town, consisting chiefly of one street of scattered houses, near a mile in length. It is governed by a mayor, bailiffs, and other officers, and has very good conveniences for building and repairing ships. It has a market, well frequented, on Saturday, but no annual fair.

Somewhere in the neighbourhood of Ilfordcomb, perhaps in that very harbour, the Danes, under the command of Hubba, their king, landed in the year 872, and attacked the castle of Kenwith; but before they could make themselves masters of the place, Odun, earl of Devonshire, appeared at the head of a small army he had raised in those parts. A bloody battle ensued; the Danes were totally defeated; their king, with twelve hundred men, slain on the spot, and their royal standard taken. This standard was called Reufan, from its having the figure of a raven embroidered on it by the three sisters of Iva and Hubba, on purpose for this expedition, and which, they were persuaded, would render them invincible. Historians add, that the Danes, after this defeat, buried the body of Hubba in the sand, piling on him a heap of stones, according to the custom of the northern nations, and which thence obtained the name of Hubba-stone. But neither the place of this monument, nor the situation of Kenwith castle, are now exactly known.

About four miles to the eastward of Ilfordcomb, is the town of Combmartin, situated at the mouth of a cove, on the Bristol channel, one hundred and seventy-four miles from London. It has its name from Kum, an old British word, which signifies a bottom, or low situation; and Martin the family name of those who were lords of it for many ages. The cove already mentioned has not water sufficient for large ships of burden; but small vessels sometimes find shelter here, and it affords a good landing for boats. In the neighbourhood of this town, the silver mines, mentioned in our account of the mines of Devonshire, are situated; and we shall only add here, that though a new audit has been lately dug at the
expence

expence of five thousand pounds, the mines have not been worked since. The best hemp in this county grows in the fields near Combmartin, and considerable quantities are cultivated, to the advantage both of the farmer and landlord. This town has a weekly market, held on Tuesday, but no annual fair.

Remarks on the SEA COASTS of Devonshire.

The land bordering on the sea-coast of the English Channel, and extending from the mouth of the Ex to Plymouth Sound, is, in general, very high, and full of cliffs towards the sea; and affords several good roads for ships, when the wind is on any point of the compass between the north and S. W. but the easterly winds blowing directly upon the coast, there are very few places, the harbours excepted, where they can ride in safety. The bay before Sidmouth harbour affords a good road, where ships often come to an anchor, when taken with a S. W. wind, which there blows off the shore.

The bay before the mouth of the Ex affords another good road, where ships may ride safely, there being from three to seven fathoms water, and very good anchorage. A little farther to the westward is a small bay, at the bottom of which is a little village called Dolage, before which small vessels may ride close to the beach.

The mouth of Tinmouth harbour we have already mentioned in describing the inland navigation of Cornwall; but it is necessary to add here, that about two miles to the westward of Tinmouth, is a small cove, called Babacon, from a village of that name situated on the strand. In this cove small coasting vessels often find shelter, it being secure from all winds, except the N. E. but it is too small, and the water too shallow, for ships of any burden. There is, however, a very considerable bay, about a mile to the westward of the above cove, where there is both room and depth of water sufficient for large ships. A point of land called Bob's Nose, the eastern cape of Tor-bay, affords a shelter to ships riding in this bay from the southerly winds.

About two miles from the land, near Bob's Nose, lies a large rock, or rather small island, called the Mewstone, from the great number of sea-mews that lay their eggs upon it. The water is near twelve fathoms deep close to the side of this rock, which would be very dangerous to seamen, if it were not visible at a considerable distance; but being very high land, it is seen soon enough to be avoided, unless the night be very dark, or the weather foggy.

Tor-bay is about eight miles broad from Berry-point, its southern cape, to Bob's Nose, its northern point; and about six miles deep. It is one of the finest roads for ships in England, and was the general station of our fleets during the whole time of king William's war with France; and has, since that time, been often the rendezvous of the British navy. It was in the southern part of this bay that the prince of Orange, afterwards king William III. landed on the fifth of November 1688.

This fleet consisted of about fifty sail of men of war of the line, twenty-five frigates, as many fire-ships, and between three and four hundred victuallers and transports, having on board four thousand horse, and nine thousand foot. Admiral Herbert led the van of the fleet; the prince commanded in the center, with a flag flying at his main top-mast-head, on which were displayed his own arms, surrounded with this motto, "The protestant religion, and the liberties of England;" and underneath, the words "Je maintiendrai," the device of the house of Nassau.

This fleet met with very tempestuous weather in its passage, and was obliged to put back to refit. On the third of November, however, the Dutch armament entered the channel, and lay between Calais and Dover; and in the evening, was off the Isle of Wight, and orders were given not to go to the westward of Dartmouth during the night; but in the morning, they had the mortification to find they were beyond both Torbay and Dartmouth. The wind, however, suddenly shifted to the south, and in less than two hours, the whole fleet were in Torbay; and the whole army landed safely on the

fifth of November, on the beach, near the village of Brixham, where there is a small redoubt mounted with cannon. Admiral Herbert, for his singular services on this occasion, was created earl of Torrington, and considered as one of the principal instruments in the delivery of his country from despotism and popish superstition.

But though this bay affords an excellent road for shipping, when the wind is any way to the westward between the south and north; yet it is very bad riding here in easterly winds; when it blows hard from that quarter, ships are either obliged to put out to sea, or stand away to Dartmouth.

There are two small piers in this bay, where small vessels lie a-ground at low water; one at Brixham, and the other at Tarkey; the former situated in the southern part, and the latter in the northern part of the bay. Before the pier of Tarkey is good anchor-ground, in four or five fathoms water.

To the westward of Dartmouth, the harbour of which we have already described in our remarks on the inland navigation of Devonshire, is a large bay, called Start-bay, where there is good anchoring in six or seven fathoms water, before a small village called Start-crofs.

Beyond the Start-point, to the westward, is the harbour of Salcomb, already described, there is a road, where ships may ride very safe in northerly winds.

About seven miles to the westward of Salcomb, is a small tide-haven, called Bigberry. Before the entrance lies a small island, on which there was formerly a castle. The entrance is also dangerous, from a number of rocks lying on both sides; so that it is very rarely frequented except by fishermen, and small craft belonging to Salcomb, and other places in the neighbourhood.

The whole coast, from Bigberry to the mouth of Plymouth Sound, is very rocky, so that very few ships come to an anchor there; especially, as Plymouth Sound is so near, where shelter may be found in all winds.

About half a mile from the southern point of the river Yalme, which is navigable near a mile from its mouth, lies a large rock, called the Mew-stone, the top of which is always dry; but it is surrounded with a number of sunken rocks, which render the passage into the river Yalme very dangerous. This passage, which is not above a quarter of a mile broad, lies between the Mew-stone and the southern point of land; but much nearer to the latter, a large ledge of rocks, extending near a quarter of a mile from the Mew-stone.

Plymouth Sound terminates the sea-coast of Devonshire on the English channel. On the other side, or that next Bristol channel, there are few roads. Barnstaple-bay, or, as it is sometimes called, Biddeford-sound, is the principal. It is a good road in southerly winds, and there is water sufficient for the largest ships, it being from five to twenty fathoms deep. Within the harbour of Biddeford there is an excellent road, off the little town of Appledore, sufficiently safe in all winds; but the bar, that stretches across the mouth of the harbour, prevents large ships from entering it.

A little to the eastward of Biddeford-sound, is Mort-bay, where ships often come to an anchor. There is also a good road in the bay, before Ilfordcomb.

These are all the roads on the north coast of Devonshire, except the island of Lundy, on the east side of which there is a very good road, where ships may ride safely in westerly winds; but the ground, on the west side of the island, is foul and rocky.

The inhabitants of Devonshire who live near the sea-coasts, enjoy very great advantages from their fishery: the rivers supply them with salmon, trout, &c. in great plenty; and vast quantities of almost every kind of sea-fish are caught in the bays and coves on both sides of this county; particularly herrings and pilchards, which afford a very advantageous branch of commerce.

The water rises, in both the English and Bristol channels, from seventeen to twenty-four feet perpendicular, on spring-tides; and on neap-tides, from ten to fourteen.

On the coast is found plenty of ore-weed, & a very rich species of sand, which prov's of singular service to husbandry, and is accordingly used in every part of the county not too far distant from the coast, as we have

already observed in our account of the husbandry of Devonshire.

Of the INHABITANTS of Devonshire.

Diodorus Siculus, speaking of the inhabitants of these parts, says, "They are a civil and courteous people, considering the barbarity of the times; strong and robust, like the soil itself, and emboldened by the roughness of their country: at the same time, they are so powerful, that they were not subdued by the Saxons till the year 465." Nor have they deviated from the virtues of their ancestors; they are still a bold, hardy, and intrepid people: they are quick of apprehension, and easily instructed in any employment. Queen Elizabeth said of the Devonshire gentlemen, that "they were born courtiers." The same thing may still be said of the gentlemen of that county; nor are the merchants, clothiers, and principal tradesmen, inferior to the gentry in good manners or good actions. The lower class of people are very robust, very diligent, and very industrious; but, at the same time, very clownish in their behaviour and manner of speaking. They are also too much addicted to drinking, especially in the manufacturing towns, and those near the sea-coasts bordering on the English channel, too much inclined to the pernicious trade of smuggling French goods, the greater part of which they fetch from the islands of Guernsey and Jersey.

Curious PLANTS found in Devonshire.

Sapphire, *Cribrum, seu Faeniculum marinum, Ray*, found on many of the cliffs, and in great plenty on the southern parts of Lundy island.

Creeping, round-leaved, bastard Chickweed, *Alfine, spuria, pusilla, ripens, foliis saxifragæ aureæ, Ray*, found in several parts of this county, to which and Cornwall it seems peculiar.

Great yellow marsh Eyebright, *Euphrasia lutea latifolia palustris, Ray*, found in several boggy places of Dartmoore.

Eryngo, or Sea-holly, *Eryngium marinum, Ray*, found on various parts on the sea-coasts, particularly near the beach in Barnstaple-bay.

Adders-tongue, *Ophioglossum*, found in plenty in the moist meadows near Biddeford.

Hemp-agrimony, *Eupatorium Cannabinum, Park*, found under the hedges, and in woods in various parts of the county, particularly in the neighbourhood of Exeter,

Sweet-cane, *Acorus, vel Calamus aromaticus*, found in watery ditches near Biddeford.

Dwarf-elder, *Ebulus, vel Sambucus caule herbaceo, ramoso*, found in various parts of the county, particularly in the fields near Torrington.

Glass-wort, *Salicornia*, found plentifully in most of the salt-marshes of this county, particularly near Barnstaple.

Horned-poppy, *Chelidonium, Torn.* found in plenty on the sea-beach, in various parts of the county, particularly in Barnstaple-bay.

Sea-lavender, *Limonium, Torn.* found in marshy places overflowed by the sea.

Ash-coloured Liverwort, *Lichen terrestris cinereus, Ray*, found on many of the commons and open heaths of this county, especially in the neighbourhood of Okehampton.

Madder, *Rubia, Torn.* This plant is found wild in many parts of Devonshire, and has been cultivated lately in some parts of the county, for the use of dyers.

Valerian, *Valeriana, Torn.* found on the mountains in various districts of the county, particularly on the hills near Crediton.

Job's Tears, *Coix seminibus ovatis, Hort. Cliff.* found under warm hedges, on the southern declivities of the hills near Biddeford.

Meadow-saffron, *Colchium, Tourn.* found in the meadows near St. Mary's Ottery, and other parts of the county: the country people call the flowers Naked Ladies, because they come up naked, without any leaves or covering.

Fig-wort, *Scrophularia*, found under hedges in various parts of the county.

Antique COINS found in Devonshire.

A gold coin of Nero, one of the Roman emperors, was dug up at Exeter; another of Theodosius, at an old castle in the neighbourhood of Barnstaple. Besides these, a considerable number of silver coins of Severus, and other Roman emperors; and, a great many of brass have been dug up in several parts of this county.

Devonshire lies in the diocese of Exeter, and province of Canterbury; and sends twenty-six members to parliament, two knights of the shire for the county, two citizens for Exeter, and two burgeses for each of the borough towns of Totness, Plymouth, Okehampton, Barnstaple, Plympton, Honiton, Tavistock, Ashburton, Dartmouth, Beeraston, and Tiverton.

S O M E R S E T S H I R E.

SOMERSETSHIRE, or, the county of Somerset, is bounded, on the north-west, by Bristol channel; on the north-east, by Gloucestershire; on the east, by Wiltshire; on the south, by Dorsetshire; and on the west, by Devonshire. It is a very extensive county, being about sixty miles in length, from east to west; fifty miles in breadth, from north to south; and two hundred miles in circumference. According to Templeman's survey, it contains thirteen hundred and thirty-five square miles, or one million seven hundred and fifty thousand acres; forty-two hundreds; three hundred and eighty-five parishes; thirty market-towns, and seventeen hundred villages. Somerton, from whence the county derives its name, though now only a market-town, situated near the middle of the county, lies one hundred and twenty-nine miles almost due west from London.

R I V E R S.

The principal rivers in this county are the Avon, the Bry, and the Parret, or Pedred.

The Avon, (called the West Avon, to distinguish it from another river of the same name, which falls into the Severn near Tewksbury, in Gloucestershire) rises near Tetbury, a market-town in Gloucestershire, and enters this county not far from a village called Claverton, about four miles from the city of Bath. Near its entrance into this county, it is joined by the Frome, a considerable river, which rises from Gournay-lake, about six miles from Wells. Augmented by this stream, it passes by the cities of Bath and Bristol, separating this county from Gloucestershire; and falls into the Severn-sea at King Road, about nine miles below Bristol.

The Bry, called also the Bru and the Brent, rises in a large wood or forest in the eastern part of this county, near the borders of Wiltshire, called Selwood, and from whence the adjacent parts of the country were formerly called Selwoodshire. Hence it runs, in a western course, near the middle of the county, passing about a mile to the southward of Glastonbury; and in Godney Moor is joined by several small streams, one of which rising near Shipton-mallet, passes about half a mile to the southward of Wells. Augmented by these brooks, it pursues its course through Brent Marsh, and falls into the Bristol channel in Bridgewater-bay.

The Parret, or Pedred, has its rise in the southern part of the county. Near Langport, it is joined by the Ordred, augmented by the Ivel; and, about four miles from this junction, it is joined by the Tone, or Thone, a pretty large river, rising among the hills in the western parts of this county. About two miles below the junction of the Tone, the Parret receives another considerable stream; and, thus augmented, it passes by the town of Bridgewater, and falls into the Bristol channel in Bridgewater-bay.

Besides the above rivers, there are several smaller streams, which, after watering different parts of the county, fall into the Bristol channel. The principal of these are the Ax and the Torr: the former rises near Wells, passes by the town of Axbridge, and falls into the Bristol channel near Uphill: the latter rises near Lytton, passes by Wrinton, and falls into the British channel near St. Thomas's Head.

Remarks on the INLAND NAVIGATION of Somersetshire.

Two only of the rivers in Somersetshire are navigable any considerable distance above their mouth, we mean the Avon and the Parret.

The Avon is navigable, for ships of very large burden, to Bristol, at high-water. About two miles above the mouth of the river, is Hung-road, where ships often

ride; and near it, on the south side of the river, are two small arms or branches of the sea, called Crocken Pill, and Morgan's Pill, where many ships are laid up, and small vessels generally come to an anchor, to wait either for the tide or a fair wind. On the northern side of the river, opposite to Crocken Pill, king William III. landed at a place called Shirehampton, on the sixth of September 1690.

About a mile above Crocken Pill, and on the south side of the river, is another small branch, called Chapp Pill: and, about half a mile above Chapp Pill, on the north side, is another branch, called the Dock, where many large ships are laid up.

A little above the Dock, the river is carried, as it were, in a deep trough, for about two miles. The rocks, on both sides of this channel, are rough, craggy, and romantic in their appearance, almost beyond description. Several of them are very high, and exhibit very grotesque figures, but pretty beyond imagination. In some places, the cliffs hang over in an astonishing manner, and some of them covered with shrubs, tufts of grass, and short trees, in such a manner, that they appear like small hanging woods, and afford a prospect remarkably pleasing.

Near the western extremity of these rocks, and on the north side of the river, the Hot-well is situated, and of which a more particular account will be given hereafter.

Just below the city of Bristol, the Avon is joined by the Froome, whose southern bank forms the quay of Bristol. Above this junction, the Avon divides Bristol into two parts, which are connected by a bridge, near which is a large quay called the Back, where small ships and coasting vessels take in and discharge their loading.

From Bristol, the river Avon is navigable, for barges, to Bath, which is about twelve miles, by means of locks erected on the river for that purpose. The tide flows up nearly to Keynsham-bridge, about three miles above Bristol; but, after passing the lock near this bridge, the barges, in their passage to Bath, have no farther assistance from the tide, but go from thence against the current of the river, which renders that part of the passage somewhat tedious. There is a very commodious quay just below the bridge at Bath, where the barges load and unload.

This navigation is of the greatest advantage to both these cities, and goods are conveyed, at a very small expence, from one to the other. It might, doubtless, be very greatly improved, by digging a canal along the valley, near the river, from Bath to Keynsham-bridge; by which means the barges would go up and down, on a still water, with very little trouble; but this would be attended with a considerable expence, perhaps more than the advantages flowing from the alteration would compensate.

The Parret is navigable, for ships of two hundred tons, to Bridgewater, where the water rises twenty-two feet on a common spring-tide; and runs up, to its junction with the Oudred, near ten miles above Bridgewater. At the new and full moon, the head of the tide of flood, or, as it is called, the Boar, comes roaring up the river in such an impetuous torrent, that it would do great damage to the shipping, if the seamen, who hear it coming for some time, were not on their guard. The cause of this uncommon phenomenon is the heightening and shallowing of the river, by which means the tide has flowed a considerable time in Bristol channel, before it enters the mouth of the Parret, the waters of which, when the tide is out, are absorbed by the sands; so that the water in Bristol channel is considerably higher than that in the river, before the flood-tide can find a passage over the bar, when it flows up in the most impetuous manner.

This

This remarkable rise of water is not, however, peculiar to the Parret; it is also known in the Severn, the Trent, and the Ouse.

In the reign of king William III. an act passed for making the river Tone navigable to Taunton; and which was accordingly carried into execution, to the great advantage of that place; for, by this means, coals are extremely reasonable, being brought to Bridgewater by ships, from Swansey and Neath, in Wales, and from Bridgewater to Taunton in barges. By the same conveyance, all sorts of heavy goods are brought thither from Bristol, such as iron, lead, oil, wine, flax, pitch, tar, grocery, dying drugs, and the like. This navigation is supported by means of a toll paid by the barges at each lock erected on the river. There is no doubt, but this navigation might be considerably improved, by connecting some parts of the river, where the stream is rapid, and, in consequence of that rapidity, the course very crooked, by canals cut from one part to the other; and, perhaps, when the modern improvements in inland navigation are better known, this may be attempted. In the meantime, this navigation, in some measure, answers the intention, and increases the trade, both of Taunton and Bridgewater.

Besides the above rivers, there are tide-havens at the mouths of several others, affording shelter to small vessels, but have not water sufficient to admit ships of burden.

A I R A N D S O I L.

The air of this county is considered as the mildest in England. In most places it is very healthy; and, in the hilly parts, exceeding fine. In the marshy and boggy parts, it is, indeed, loaded with heavy vapours, which render those places unhealthy, especially in the spring and autumn, when intermitting fevers are very frequent, and often prove fatal to strangers. The soil is various; the eastern and western parts of the shire are mountainous and stony, but yield great quantities of corn, by which many markets are amply supplied.

Wood thrives here better than in any other part of the kingdom; while the oxen bred and fattened here, are as large as those of Lancashire or Lincolnshire, and the grain of the flesh said to be finer. The lower grounds, except those which are boggy or fenny, afford pasture for a prodigious number of black cattle; and the higher, for amazing flocks of sheep.

Of the HUSBANDRY of Somersetshire.

The husbandmen of Somersetshire are very diligent in their occupation, but very late in the modern improvements; they pursue the course pointed out by their forefathers, without regarding what has lately been written on this subject, and which, if properly put in practice, would prove of the utmost advantage to many parts of the county. The turnip husbandry is not practised so much as it deserves; and the cultivation of madder hardly known, though there is a great call for that necessary plant in most of their manufacturing towns. The rent of lands is very various in different parts of the county; in some districts, fetching twenty shillings per acre; and in others, not more than five and six. Their course of crops, taken in general, is, 1. fallow; 2. wheat; 3. barley; 4. clover. In some parts, near Bristol channel, they use ore-weed and sea-sand for manure; and some of the more intelligent farmers make a compost dunghill with ore-weed, dung of animals, earth, and sea-sand; by which means these various substances are blended together, and form an excellent manure. Marle is used in some parts of the county, and in others lime; and we remember to have seen, in some particular districts, clay burnt, and spread upon the land to great advantage. The clay is burnt in a kiln in the same manner as lime, and spread upon the land as soon as cool; for, the sooner it is laid on the land, after the burning is completed, the better. About fourteen common cart-loads were, we were informed, sufficient for an acre; and that it proved an excellent manure, for either meadow, pasture, or

arable land: it will last a very considerable time on the two former, but in the latter, its efficacy will cease after three crops. It must, however, be remembered, that this manure is principally adapted to stiff clayey soils; for, in the light and sandy, it will be rather prejudicial, by rendering the soil still lighter. They also Denshire their lands in many parts of this county, and generally to good advantage.

* In the neighbourhood of Winton we saw large tracts sown with teazle, a species of thistle, the heads of which are used by the clothiers in dressing their cloth. This plant, so necessary in the woollen manufacture, is cultivated in very few places, the teazles raised near Winton supplying the principal manufactures of this kingdom. The teazle succeeds best in land of a thin sweet surface, and marly bottom, though a clay or stony bottom will do, and produce large crops. Rich loam, or strong clay, is very improper, as the plant is apt to grow luxuriant, and the heads to be large and coarse hooked; and, in a moist summer, subject to mildew, and rot before they are fit to cut.

The expence of a crop of an acre of teazles generally amounts to something more than thirteen pounds, rent of the land included; and a full crop usually sells for about twenty-two pounds: but, it must also be remarked, that a very considerable crop of beans may be procured on the same ground, without any injury to the teazle crop, and which will frequently pay the expence of labour attending the whole.

That ingenious farmer, Mr. Willy, of South-Petterton, whose lands we viewed with great satisfaction, has made several improvements in drilling beans and turnips: the former are sown in double rows, about ten inches apart, and about two feet intervals. These intervals are plowed from and to the beans, when about six inches high: this is done by means of a small plough, called, in that country, a Sull, drawn by one horse, which will plow three acres in a day: the latter are also sown in double rows, and succeed extremely well. It gave us great pleasure to see that his neighbours followed so judicious a practice, and readily adopted the drill husbandry, according to the modern improvements.

The price of labour, during the winter and spring, is one shilling, and one shilling and two-pence, a-day; and in hay and corn-harvest, mowing and reaping, one shilling and six-pence, with a dinner and beer.

Of the MINES of Somersetshire.

The principal mines of lead in this county are situated in Mendip hills: the ridges of these hills run in a confused manner, but mostly in an east and west direction, and are of a very unequal height. The soil is barren, and the air cold, moist, thick, and foggy. The surface is, in general, covered with heath, fern and furze, and, consequently, affords very little food for cattle, which are principally sheep. Snow and frost continue longer on these hills than in the neighbouring vallies; and the trees, whose leaves are scorched and discoloured, never grow to any considerable size; and, when the veins of ore run near the surface, the grass is generally of a pale yellow colour.

The inhabitants, however, enjoy a good state of health, except such as are employed at the melting-houses, who, if they work in the smoke, are often seized with a disease, called the Mill-reek, which generally proves mortal. Nor is this disorder confined to the men; the very cattle, that feed in places where the smoke rests upon the ground, are seized with it; and it is asserted, that when the smoke mixes with the water, in which lead-ore has been washed, it proves mortal to the cattle that drink of it, though at a considerable distance.

In these mines the ore sometimes runs in a vein, sometimes it is found dispersed in banks, and sometimes it lies between rocks. It has even been known to run up into the roots of trees, which, notwithstanding, looked as well at the top as other trees. The ore is found surrounded with spar, cawk, a ponderous white stone resembling chalk, and another substance, called by the miners Croots, a soft, mealy, white species of stone.

The

The spar is white, transparent, and as brittle as glass, and the cawk also is white, and heavier than any stone. The vein lies between these crooks, and is of different breadths; sometimes it rises near the surface, and sometimes lies very deep in the earth. It often breaks off abruptly in an earth which the miners called a Deading-bed; and, at the distance of a fathom or two, is frequently found again in a direct line with the point where it broke off. It is sometimes stopped by a black thick stone, called a Jam; and frequently terminates in a dead clayey earth, without croot or spar; and sometimes in a rock, called a Fore-stone. The clearest and heaviest ore is the best; and thirty six hundred weight of such ore will yield about a ton of lead.

When the miners have procured a certain quantity of the ore, they beat it small, wash it in a running stream, and sift it in iron rudders. The ore being thus washed and sifted, a hearth, or furnace, made of clay or fire-stone, about five feet high, is built upon posts of timber, in such a manner, that it may be moved round like a wind-mill, to prevent the inconvenience of having the smoke blown upon the workmen. On this hearth are placed a quantity of oaken billets, which are kindled with charcoal, and the fire blown with bellows moved by the feet. When the earth is sufficiently hot, the lead-ore is thrown into the fire, where, being melted, it runs down into a sink made at the sides of the hearth, from whence it is taken with iron ladles, and cast in sand into lumps, which the miners call Sows and Pigs.

In these mines any Englishman may freely work, except he has forfeited his right by stealing any of the ore, or working-tools belonging to his fellow miners. For it is a custom here to leave both their ore and tools all night upon the hills, either in the open air, or in some slight hut, without much apprehension of having them taken away: and, should any miner be convicted of a theft of this kind, he is condemned to a particular species of punishment, called Burning of the Hill, and is performed in the following manner: The criminal, with his hands and feet at liberty, is shut up in one of the little huts, erected for keeping the ore and tools, and the hut surrounded with dry furze, fern, and other trash of the same kind found upon the hills. The hut being thus surrounded, fire is set to it in different places at the same time, and the criminal left to make his escape in the best manner he can, by breaking open his prison, and rushing through the fire; but he is, for ever after, excluded from working in the mines of Mendip-hills.

On the western parts of these hills are mines of Lapis Calaminaris, where plenty of that fossil is found lying near the surface of the earth. It is of several colours, some white, some inclining to red, some grey, and some blackish: the last is counted the best; and this, when broken, is of several colours.

The strata, or veins of Lapis Calaminaris, or Calamine, run between the rocks, generally wider than those of lead-ore, except when they are inclosed in very hard cliffs, when they are even narrower than those of lead. The colour of the earth where the calamine lies, is generally of a yellow cast, but sometimes black. They often find a considerable quantity of lead among the calamine.

When they have procured a sufficient quantity of the calamine, they wash, cleanse, and buddle it, in the following manner. They inclose a small piece of ground with boards or turfs, through which a clear stream of water runs. Within this inclosure they shovel, and often turn their calamine, by which means the impure and earthy parts are carried off by the water, while the lead, calamine, and other stony substances, are left behind. When they have thus washed the calamine as clean as they can, they put the smaller parts into sieves made of strong wire, and these they often dip and shake up and down in a large tub of water, whereby the parts of the lead mixed among the calamine sink to the bottom of the sieves, the calamine remains in the middle, and the other sparry parts rise up to the top, and which are scummed off and thrown away. Then they take off the calamine, and, after that, the lead. When they have so far cleansed the calamine, they spread it abroad, and pick out, with their hands, the trash and stones that remain. But all the ca-

lamine does not require so much trouble; for some rises in lumps, out of the works, large enough to be cleansed and picked, fit for the calcining oven, without all this charge and pains; and several loads of calamine have been raised, unmixed with earth, or other trash.

The calamine being thus prepared, they carry it to the calcining oven, which is built in the same form as that used by bakers, but much larger: on one side of it is a hearth, divided from the oven itself by a partition open at the top, by which means the flame passes over the calamine, and calcines it. The fire is common pit coal, which is thrown upon the hearth, and there lighted with charcoal. In about four or five hours, during which the calamine is turned several times with long iron rakes, it is, in general, sufficiently calcined: but this is not always the case; for, some being much harder than others, requires a longer time. When it is sufficiently calcined, they beat it to powder, by long iron hammers, on a thick plank, picking out what stones they find among it; by which means the calamine is at last reduced to dust, and then fit for sale. Its principal use is to turn copper into brass.

There are also several coal-mines in Somersetshire; particularly about Stony Easton, where there are six distinct coal-works. In several of these pits, the veins are covered with a coat of a black, hard and stony substance, called Wark, which splits like slate, but is much more brittle, and not near so hard. Upon dividing the wark, there is often found, upon one of the separated surfaces, the perfect resemblance of a fern-leaf, as if cut in relief by a skilful hand; while the other piece, to which it belongs, has the same figure cut into the surface, and seems as if it were the mould or case of the protuberant figure on the other side.

In order to discover a vein of coal, they first search for what they call the Crop, which is really coal, though very friable and weak, and sometimes is found on the surface, or, in the miners phrase, appears to the day. Sometimes, instead of the crop, they find what they call the Cliff, a dark or blackish rock, which lies parallel with the coal, and in the same oblique direction; for all coal lies shelving like the roof of a house, not perpendicular, nor horizontal, unless the vein be broken by a ridge, or parting of clay, stone, or rubble; as if the veins, by some violent shock, had been disjoined and broken, so as to let in the rubble, &c. between them.

Some of the coal, in the works above-mentioned, are much more tinged with sulphur than others. In one of these pits, a vein was wrought some years since, which received such a replendency from its sulphureous tincture, that, in all its joints, it appeared as if covered with leaf-gold; whence it was called, by the colliers, the Peacocks Vein. In another of these works, there was found between two and three hundred weight of very good lead-ore, growing in a vein of coal; a particular never before observed in any work of this kind.

Several of these works are, however, very subject to what the miners call Fire-damps, the vapour of which, being touched by the flame of a candle, presently takes fire, and produces all the effects of lightning, or fired gunpowder. Many colliers have perished by means of these damps, though they still pursue the work; but, to prevent mischief, use no candles, but such as are of a single wick, and of sixty or seventy to the pound. These, however, give as great a light here, as those of ten or twelve to the pound do in other places. They are likewise very careful to place these small candles behind them, and never present them to the breast of the work.

Besides the mines already mentioned, there are some few of copper and ochre in Mendip-hills; and at Bishops Chew, or Chew Magna, near Winton, there is dug up a red bole, called by country people Redding, and is distributed from thence all over England, for marking of sheep, and other uses.

TRADE and MANUFACTURES.

All sorts of cloth are manufactured in this county, as broad and narrow cloths, broad and narrow kerseys, druggets, serges, durroys, and shalloons, together with stockings

stockings and buttons; and, in the south-east parts, great quantities of linen are made. The value of the woollen manufacture alone, in the first hands, has been rated at a million *per annum*; and, if a calculation be made of the other manufactures of this county, and its produce by mines, tillage, feeding, grazing, dairies, and other articles, it is thought it would equal that of any county in England. And, with regard to foreign trade, it is certainly equal to that of any other, Middlesex alone excepted.

CITIES, BOROUGH, and MARKET TOWNS.

We entered this county from the northern parts of Devonshire; and first visited Porlock, a small market-town, situated near the borders of Devonshire, one hundred and sixty-nine miles from London. It stands at the mouth of a little river, which small vessels enter with the tide, and, by that means, some trade is carried on with Bristol, and the coast of Wales. This is the place where Harold landed from Ireland, in the year 1052, slew numbers of the people who opposed him, and carried off a large booty. Porlock has a small market on Thursday; and three annual fairs for the sale of cattle, viz. the Thursday before the twelfth of May, the Thursday before the ninth of October, and the Thursday before the twelfth of November.

From Porlock we continued our journey, near the seaside, to Mine-head, an ancient borough town, situated at the mouth of a small harbour in the Bristol channel, one hundred and sixty-seven miles from London. It was incorporated by queen Elizabeth, and endowed with great privileges, on condition the corporation should keep the quay in repair; but the trade of the place falling to decay, the quay was neglected, in consequence of which, the corporation lost their privileges. But an act passed in the thirteenth year of William III. and which was continued by another in the tenth of queen Anne, for recovering, securing, and keeping in repair, the harbour of Mine-head. And, in the sessions of 1738, another act passed, for further continuing the terms and powers of the two former acts, in order to effect the same laudable purposes; in consequence of which, a new head has been lately added to the pier, the beach cleared away, and the whole works greatly improved; so that ships of very large burden may enter the harbour, and ride in safety during the most furious storms. And it should be remembered, that during the terrible tempest in Nov. 1703, when many of the ships, in every harbour of this county, were driven on shore, wrecked and lost, the vessels in this harbour suffered very little damage.

Minehead returns two members to parliament, is well built, full of wealthy merchants, and carries on a very considerable trade to Ireland, Wales, Bristol, Virginia, and the West Indies. At the same time, the merchants at Minehead are connected with those of Barnstaple and Bristol, in their foreign trade. The herring fishery is also carried on here to great advantage, three or four thousand barrels being annually caught, cured, and shipped off to Portugal, Spain, and Italy. Near three thousand chaldrons of coals, from the ports of South Wales, are imported here; and great quantities of wool are landed at this port from Ireland.

Minehead was formerly governed by a portreve, but now by two constables, chosen annually at the court-leet of the lord of the manor. It has a weekly market on Wednesday; and an annual fair, held on Wednesday in Whitsun-week, for toys and pedlars ware.

Dunster is a small market-town, situated on the coast of the Bristol channel, about three miles from Minehead, and one hundred and sixty-four from London. It stands at the mouth of a little river, which is a tide-harbour for small vessels. The situation is low, and the town is surrounded, on every side, with hills, except towards the Severn Sea, or Bristol channel. It consists of about four hundred houses, and has a considerable manufacture of kerseys. The church was built by Henry VII. It is a spacious structure, and has a handsome tower. Here was formerly a strong castle, now in ruins, consisting of two wings and three towers. It was garrisoned by Charles I.

in the civil wars, but taken by admiral Blake; after which, it became the prison of William Prynne, for refusing to pay taxes to Cromwell, as he had before done to Charles I.

In the time of William the Conqueror, Sir William de Mohun built here a priory for Benedictine monks: it was dedicated to St. George, and annexed as a cell to the abbey of St. Peter at Bath. About the time of the dissolution of religious houses, it consisted of three monks only, whose maintenance was valued at thirty-seven pounds, four shillings and eight-pence *per annum*.

Dunster is called a borough in old writings, having formerly sent members to parliament, but has long since lost that privilege. It has, however, still a well-frequented market, on Friday; and an annual fair on Whitsun Monday, for toys and pedlars wares.

We still continued our journey, along the sea-coast, to Watchet, a small sea-port town, situated at the mouth of a little river, four miles from Dunster, and one hundred and sixty from London. This place was much more considerable formerly than at present, and many vessels of burden belonged to it; but, by neglecting the pier and harbour, both the trade and town decayed greatly. To remove these obstructions, an act of parliament was passed in the sixth, and another in the tenth year of queen Anne, for repairing the pier and harbour; but, when the works intended were nearly completed, it was found, that the pier-wharf was too low, and not extended to a sufficient length, to preserve the town, and the ships riding in the harbour, from the violence of the sea. Another act was therefore obtained in the seventh year of the reign of George I. for continuing the duties laid by the former act, and remedying the inconveniencies already mentioned. These improvements have increased the trade of the town from what it was before the pier was finished; but, in all probability, it will never again acquire its former consequence. There are, at present, ten or twelve small vessels belonging to Watchet, employed in the coal-trade to Wales, and as coasters to Bristol. Many of the inhabitants are employed in making kelp, from the ore-weed found, in great plenty, on the coast. This salt is used in the glass manufacture, as we have already observed in our account of the islands of Scilly, where we have described the process for making it. Great quantities of alabaster, which fall from the cliffs in the neighbourhood, by the wash of the sea, are sent to Bristol, and other places on the coast. With this, and the kelp above-mentioned, many vessels are loaded here, to the great advantage of the inhabitants.

On the coast are found great quantities of a particular kind of pebbles, which the inhabitants burn into lime, for dressing their lands. It is also used as a cement in building, especially in such parts of the work as lie under water, where it will turn as hard as marble.

Watchet sent members to parliament in the thirtieth year of the reign of Edward I. but not afterwards. It has, however, still a weekly market on Saturday; and a fair on the twenty-fifth of August, for cattle, hogs, sheep, and cheese.

Bridgewater was the next town we visited. It is situated on the river Parret, about twelve miles from its mouth, and one hundred and forty-three from London. It was made a free borough by king John, and a distinct county by Henry VIII. Queen Elizabeth granted the town a new charter, the privileges of which were extended to the whole parish, by another charter in the reign of Charles I. It is governed by a mayor, recorder, two aldermen, who are justices of the peace, and twenty-four common council-men. Here is also a town-clerk, a clerk of the market, a water-bailiff, and two sergeants at mace. Out of the common council-men, two bailiffs are annually chosen, who are invested with a power equal to that of sheriffs, as the sheriffs of the county cannot send any process into the borough. There is also annually chosen, out of the members of the common council, a receiver, who collects the town-rents, and makes payments. The revenues of the borough amount to near ten thousand pounds a year, and arise chiefly from the manor of the town, the great and small tithes, the manor of East Stower, in Dorsetshire, &c. The freemen

of Bridgewater are free in all the ports of England and Ireland, except London and Dublin.

Bridgewater is one of the most considerable towns in the whole county, whether considered as a sea-port, a borough, or a thoroughfare. Ships of two hundred tons burden come up to the quay, by which means the town carries on a pretty good coast-trade with Bristol, Wales, and Cornwall; and twenty sail of ships at least are constantly employed in the coal-trade. Its foreign trade is chiefly to Portugal and Newfoundland: sometimes ships sail from hence to the straits, Virginia, and the West Indies. Large quantities of wool are imported here from Ireland. From these species of trade, and others not mentioned, the receipt of the customs amounts annually to about three thousand pounds a year, clear of salaries, incidents, &c. We have already mentioned the singularity of the tide here, in our account of the rivers and inland navigation.

The place consists of about six hundred houses, and has a spacious town-hall, and a market-cross in the center, on which there is a cistern, fed with water by an engine erected on an adjacent stream; and from this cistern the water is conveyed, by pipes, to the houses of the inhabitants. The church, which is dedicated to St. Mary, is a plain, but spacious structure, and decorated with a lofty spire. Here is also a large meeting-house, with a raised seat for the mayor and aldermen, when they happen to be dissenters; and here is also a private academy, for such of their youth as are intended for preachers. Near the church is a large free-school, built of free-stone; and under the school-room are lodgings for the poor of the parish. Without the south-gate is a neat alms-house, built by major Ingram, a native of this place: it is inhabited by the poor, but has no endowment.

Here is a castle, built by William de Brivere, lord of Bridgewater, in the latter end of king John's reign: he also began the stone bridge over the river Parret, but dying before the work was completed, Thomas Trivet, afterwards lord of the manor, finished the work. The quay, called the Haven, was also built by the same William de Brivere. In the year 1724, the late duke of Chandos built a fine street here, with convenient warehouses, and other conveniencies for carrying on trade. The summer assizes for the county are often held here.

In the time of the civil war, this town was regularly fortified, and sustained several sieges. It was first garrisoned by the parliament, but soon after reduced by the king's forces, who kept possession of the place, notwithstanding several attempts to reduce it, till near the conclusion of the war, when it surrendered to Oliver Cromwell, on the twentieth of July 1645. Forty pieces of cannon, a great quantity of provisions and ammunition, together with near one hundred thousand pounds in money, were found in the place, many persons of condition having retired hither, with their effects, at the approach of the parliament army; but the town suffered terribly by the siege.

The duke of Monmouth was here proclaimed king on the second of July 1685, and lodged in the castle. On the fourth, the king's horse and dragoons were quartered at Weston, about three miles from Bridgewater; and the infantry encamped in an advantageous post near it, having a ditch in their front, and facing the Moor, a large fine plain. In this situation the duke determined to attack them in the dead of the night; accordingly, he drew his men out of Bridgewater late in the evening, and conducted his march with such care and silence, that he passed, without opposition, into the Moor, and drew up his foot, which consisted of between five and six thousand men, in order of battle. In this manner he advanced towards the royal army, and came very near their camp before he was discovered. The battle began early in the morning, when Monmouth's horse fled at the first charge, owing, as it was thought, to the inexperience, cowardice, or treachery of lord Grey, who commanded them, and who, being taken, readily obtained the king's pardon. The foot, however, were not so easily routed; they stood firm, maintaining their ground, with great resolution, for some time; but, being deserted by the horse, and

exposed to a terrible fire from the king's artillery, they at length gave way, when a most dreadful slaughter ensued among them; above three hundred were killed on the spot, a thousand in the pursuit, and near fifteen hundred taken prisoners.

The morning after the battle, the town of Bridgewater exhibited the most shocking spectacle: the routed soldiers, who had strength to reach hither, either perished of their wounds in the streets, or remained there without assistance. At last, general Kirk's troops entered the town, by whom they were stripped, and driven, naked, to the prison and church, the soldiers pricking them with their swords, to quicken their pace. Some were hanged in cold blood, without any trial; and, three or four months after the battle, eleven men were hanged and quartered on the corn-hill.

William de Brivere, already mentioned, about the fifteenth year of the reign of king John, founded an hospital here, near the East-gate: it consisted of a prior, or master, and brethren, who were to maintain thirteen poor infirm persons, besides pilgrims; and, to enable them to do this, he endowed the hospital with revenues, amounting to one hundred and twenty pounds, nineteen shillings and a penny *per annum*. Here was also a house of grey friars, founded by William de Brivere, son of the above, about the year 1230.

Bridgewater sends two members to parliament, has three weekly markets, held on Tuesdays, Thursdays, and Saturdays. Those held on Tuesdays and Saturdays, are for provisions, and are well frequented; but the Thursday's market is one of the most considerable in the whole county, for corn, cattle, hogs, sheep, and cheese, many waggon-loads of the latter being brought hither from different parts of the county, and even from Devonshire.

Besides these markets, four annual fairs are held here for the sale of cattle, and all sorts of goods, viz. the second Thursday in Lent, the twenty-fourth of June, the twenty-first of September, and the twenty-eighth of December. That in September, called St. Mathew's fair, is reckoned the largest in the whole county.

This place was formerly remarkable for a sort of kerseys, called Bridgewaters, but the manufacture has been discontinued for many years.

From Bridgewater, we passed along the banks of the Parret, in order to visit the town of Taunton; and, in our way, surveyed the small island of Athelney, famous for the retreat of king Alfred, after his defeat by the Danes. It is a small island, situated at the confluence of the Parret and Tone, and contains about two acres of land, but has now nothing remarkable. Alfred, after regaining his kingdom, built a monastery here, the foundations of which were discovered by some labourers in the year 1674. Among other subterraneous remains of this building, there were found several pedestals of church pillars, of wrought free-stone, together with coloured tiles, and other things of the same kind; and, some time after, was found, a sort of medal, or picture of St. Cuthbert, with a Saxon inscription, importing, that it was made by order of king Alfred. It appeared, by its form, to have been suspended by a string; and it is conjectured, that the king wore it, either as an amulet, or in veneration of St. Cuthbert, who is said to have appeared to him in his troubles, and assured him of the victories he afterwards obtained over the Danes.

About four miles from the isle of Athelney, is North Curry, situated on the banks of the Tone, one hundred and forty-two miles from London. It is a small market-town, and the capital of the hundred of the same name. It has a weekly market on Tuesday; and an annual fair on the first of August, for the sale of black cattle, sheep, and toys.

Taunton, situated on the river Tone, one hundred and forty-seven miles from London, is one of the largest, most flourishing, and populous borough towns in the kingdom, and situated in a delightful part of the county. A castle was built here by Ina, king of the West Saxons, and which his wife afterwards demolished. Some time after, another castle was erected by one of the bishops of Winchester, to which see this town and deanry belonged,

longed, even before the conquest. This castle was of great extent; and the castle-hall, and porter's lodge, are still standing; and, in the hall, which is very spacious, the assizes for the county are generally held.

At the entrance into the court, and over against the town-hall, is the exchequer, where the bishop's clerk keeps his office, and where a court is held every Saturday, for the bishop's tenants. The walls of this structure were demolished by Charles II. in the year 1652, when the corporation refused to renounce the solemn league and covenant, by which their charter was forfeited. After this, the borough remained seventeen years without a charter, during which time it was governed by portreves and constables. At last, bishop Mew procured a new charter from Charles II. by which it is now governed.

The corporation consists of a mayor, recorder, two aldermen, twenty-four capital burgeses, a town-clerk, two constables, two portreves, and two serjeants at mace. Besides these magistrates, there are six gentlemen, who are justices of the peace at large, and may act within the borough. The mayor and aldermen are chosen annually out of the burgeses; and the portreves have the benefit of the standings in the markets, which are let upon lease at near fifty pounds a year. The mayor's officers have no power to arrest; nor is there any prison here, except a bridewell for vagrants, debtors and criminals being sent to the county gaol at Ilchester. The corporation are not possessed of any lands, houses, or joint stock of money; so that it is the poorest corporation, though the town is the most flourishing in the county.

The streets are, many of them, wide and handsome; and the market-house, over which is the town-hall, a large and convenient building. Here is also a fine bridge, of six arches, over the river Tone, kept in repair at the expence of the county. Here are two parish churches, one of which, dedicated to St. Mary Magdalen, is a spacious edifice, with a lofty tower, adorned with pinnacles finely carved. Here are also several meeting-houses of protestant dissenters, and an academy, where persons intended for dissenting teachers are educated. Taunton has likewise a well-endowed grammar-school; and an hospital, founded by Robert Gray, Esq; a native of this place, for six men and ten women, who have each two shillings a week, and are accommodated with a chapel for daily prayers: the men have a gown every year, and the women a waistcoat and petticoat once in three years. There are also other alms-houses; one founded by — Huish, Esq; also a native of Taunton, for thirteen decayed tradesmen, who have each two shillings and sixpence a week, and a gown every three years. Mrs. Dorothy Henley likewise erected a row of alms-houses, which are inhabited by twenty men and women, but have no endowment.

The inhabitants are computed at about twenty thousand, many thousands of whom are employed in the manufactures of serges, duroys, sagathies, shalloons, and other sorts of woollen stuffs, in the weaving of which, eleven hundred looms, at least, have been here employed at one time; and every child above five years old, provided it has been properly instructed, is capable of earning its own bread.

We have already observed, that the river Tone was made navigable to Taunton, by virtue of an act of parliament passed in the reign of William III. This work has been of great advantage to the town, as all inland navigations must prove to every place where manufactures are carried on, there being always a very considerable demand for heavy goods.

Taunton sends two members to parliament; but the qualification of the electors is something singular. All pot-walloners, *i. e.* all who dress their own victuals, are intitled to vote; and, in order to qualify themselves, the inmates, or lodgers, take care to have a fire lighted in the street, some time before the election, where they dress their victuals publickly, that their votes may not be called in question.

The castle of Taunton was twice in possession of the rebels during the reign of Henry VII. first by one Flemmock, a Cornish lawyer, and Michael Joseph, a black-

smith, who here seized and murdered the provost of Penryn, a commissioner of the subsidy, which provoked the Cornish men to rebel; and, not long after, the impostor Perkin Warbeck took possession of it, but was soon obliged to fly by the Devonshire forces. In the time of the civil wars, a garrison was first placed here by the parliament, but soon after driven out by the marquis of Hertford's men. Nor did the royal party continue long in possession of it; for the place was, in a little time, taken by colonel Blake, afterwards general and admiral, who was appointed governor. Not long after, it was besieged by a party of the royal army, under lord Goring; but Blake defended it till he was relieved.

Many of the inhabitants of Taunton were involved in the ruin of the duke of Monmouth; and this town was the chief scene of Jeffreys' and Kirk's bloody executions. The latter caused nineteen wounded men to be hanged here, without even permitting their relations and friends to speak with them. Vast numbers were condemned by Jeffreys, who persuaded the poor wretches to confess themselves guilty, and throw themselves on the king's mercy. When he had thus perfidiously convicted the unfortunate insurgents, he caused them to be immediately executed, and their quarters to be exposed on trees by the road-side. Above twenty gentlemen were here put to death in the most ignominious manner; and, when James II. issued his proclamation of pardon, forty young ladies were particularly excepted, because they had presented the duke, when he came to Taunton, with colours made at the expence of the town. It is, therefore, no wonder, that the inhabitants received the prince of Orange with every mark of the most sincere joy; and, it is not doubted, but that prince, had he wanted assistance, might have raised a little army in this town, and its neighbourhood.

Without the East-gate, there was formerly a priory of black canons, founded by William Giffard, bishop of Winchester, in the reign of Henry I. It was dedicated to St. Peter and St. Paul, and valued, on the dissolution, at two hundred and eighty-six pounds, eight shillings and ten-pence *per annum*. There was also in this town an ancient leper-house, the advowson and patronage of which was granted to the abbot and convent of Glastonbury, by Thomas Lambritz, about the year 1280.

Here are two large weekly markets, held on Wednesday and Saturday; and two annual fairs; the first on the seventeenth of June, for cattle; the second on the seventh of July, and holds three days; the first for horses, black cattle, and sheep; and the second and third for toys, &c.

The country round Taunton, consisting of a tract of land, near thirty miles in circumference, is called the Vale of Taunton, or Taunton-dean. It is so remarkable for its fertility, that it requires no manure. It is divided into five hundreds, and these subdivided into ten collections, each having a reve to collect the bishop's rents, being all annexed to the see of Winchester, and amount to about one thousand pounds a year. The receiver is the chief officer, and used to sit next the bishop, when he was present. Every hundred has a beadle, to summon the jury, &c. The tenures are copyhold lands, over-lands, and reve-lands. Copyhold-lands are subject to suit and service, heriots and fines, either on surrender or death. Over-lands are subject to fines, but not to heriots, suits and service. The reve-lands oblige the tenants to exercise the office of reve, to collect the bishop's quit-rents, and the like, on pain of forfeiture. All the lands in this tract are registered, and commonly sell for twenty years purchase, though subject to fines and quit-rents, heriots, service, &c. being valued, both on account of the goodness of the title, ensured by the register, and the fertility of the soil. Many persons, however, consider the ties upon them to lessen their value considerably, and thence prefer other tenures, though without the security of a register.

Willington is a small market-town, situated also on the Tone, about four miles from Taunton, and one hundred and fifty-one from London. It has a small market on Thursday; and two annual fairs, held on the Thursday before Easter, and Holy Thursday; both for cattle.

About

About five miles to the south of Willington, and one hundred and fifty-three from London, is Wivelscomb, another small market-town, where there is an hospital, endowed by Sir John Coventry, for twelve poor persons. The market is on Tuesday; and the fairs on the twelfth of May and the twenty-fifth of September, both for cattle.

About two miles from Wivelscomb, is a little town, called Milverton, situated on a river that falls into the Tone. It is remarkable for being one of the boroughs of this county that excused itself from sending members to parliament. Here are four annual fairs for the sale of cattle, viz. Tuesday in Easter-week, St. James's day, the twenty-first of July, and the tenth of October.

Dulverton is situated on the borders of Devonshire, one hundred and sixty-nine miles from London. Here is a stone-bridge over the Dunbrook, a little above its junction with the Ax. The town is neatly built, and has several inns, where there are good accommodations for travellers. There are some lead-mines in the neighbourhood of this town, but the ore is hard and barren, and the lead extracted from it so hard, that it is fit for little else than bullets, weights, &c. This manor, and indeed the whole hamlet, was formerly granted to the priory of Taunton by William Montacute, earl of Salisbury. The market, which is held on Saturday, is very well frequented; and there are, besides, two annual fairs for the sale of cattle, viz. the tenth of July, and the eighth of November.

Chard is a considerable market-town, situated on the borders of Dorsetshire, one hundred and forty miles from London. It is a post-town, and, in the reign of Henry III. was made a free borough, but afterwards lost that privilege by its own negligence. The assizes were also held here formerly, but now removed to Taunton and Bridgewater. The town consists chiefly of four streets, which terminate near the market-place. Several streams flow through the town, which keep it very clean. One of these streams, it is affirmed, will, by being turned north, fall into the Severn-sea; but, turned south, will fall into the British channel. Here are two alms-houses, a pretty considerable woollen manufacture, and several fuling mills in the neighbourhood. The market is on Monday, and well frequented; besides which, the town has three annual fairs, held on the third of May, the fifth of August, and the second of November, for cattle and pedlars wares.

From Chard we passed to Crewkern, a good thoroughfare town, situated on the Parret, near the borders of Dorsetshire, one hundred and thirty-three miles from London. Here is a charity-school, and formerly there was a chauntry. It has a market on Saturday, for corn, sheep, and provisions; and one annual fair, held on the fourth of September, for black cattle, horses, linen-drapery, cheese, and toys.

Ilminster is a pretty large market-town, about four miles from Chard, and one hundred and thirty-eight from London. Here is a considerable woollen manufacture; and a spacious church, in which is a stately monument erected to the memory of the founder of Wadham college in Oxford. Here is a weekly market on Saturday; and one annual fair for horses, black cattle, pigs, and cheese, held on the last Wednesday in August.

From Ilminster we passed to South Petherton, so called from its situation on the river Pedred, or Parret. It has the epithet South added, to distinguish it from North Petherton, situated on the same river, about twelve miles to the north-west. It is a pretty compact market-town, has a stone bridge over the Parret, which is navigable, for boats, to this town. Ina, king of the West Saxons, had a palace here, but there are now no remains of the building. The market, which is held on Saturday, is well frequented; besides which, here is an annual fair, on the fifth of July, for black cattle, lambs, and toys.

North Petherton is the capital of a large hundred of its own name, and carries on a considerable manufacture of serges. It has a large church, with a lofty tower, and a good ring of bells. The market is held on Tuesday; besides which, there is an annual fair on the first of May, for shoes and toys.

Langport is situated on the river Parret, a little below its influx with the Ivel, one hundred and twenty-nine miles from London. It is a great thoroughfare, being situated on the road leading from London to Taunton, and other towns in the west; and formerly sent members to parliament, but lost that privilege long since. It is governed by a portreeve and recorder. Many lighters are employed here in fetching coals; and other heavy goods, from Bridgewater, by the river Parret. The market is held on Saturday; and here are four annual fairs, viz. the second Monday in Lent, for fat cattle; the twenty-ninth of June, for black cattle and lambs; the twenty-fourth of September, for fat cattle and colts; and the eleventh of November, for fat cattle, hogs and sheep.

Near this town is a small island, formed by the rivers Ivel and Parret, called Muchelney Isle, where king Athelstan built a Benedictine abbey, and dedicated it to St. Peter and St. Paul. The structure continued till the dissolution of religious houses, when it was rated at four hundred and forty-seven pounds, four shillings and eleven pence *per annum*.

From Langport we pursued our route, along the banks of the Ivel, to Ilchester, so called by a corruption of the Saxon name Ivelcester, a castle on the Ivel, on which it is situated, about one hundred and twenty-five miles from London. It is a very ancient borough, and governed by two bailiffs and twelve burgessees, who are lords of the manor. The county assizes were held here in the reign of Edward III. but they have, long since, been held alternately at Wells, Taunton, and Bridgewater. It sends two members to parliament; and here the knights of the shire, for representing the county in parliament, are still chosen; the county assizes are held here; and here is the gaol for debtors and malefactors.

Ilchester was formerly very populous, and a place of great importance. About the time of the conquest, it had not only a castle, but was encompassed with a double wall. Some will have this castle to have been built by the Romans, to curb the Britons, after the insurrection of Boadicea. Here is a good stone bridge over the Ivel, on which are still to be seen the remains of two ancient towers. It had formerly four parish churches, but, at present, there is only one; and, as the chief dependence of the place is on the county gaol, it cannot, for that very reason, be supposed, either a polite, wealthy, or desirable residence.

Here was formerly an hospital for poor travellers, dedicated to the Holy Trinity, and founded by William Dacus, some time before the year 1220. In the reign of Edward II. it was changed into a house of religious women, under the government of a prioress; but, some time before the general dissolution, it dwindled into a free chapel. About the ninth year of Edward I. a house of preaching friars was founded here.

Here is a weekly market on Wednesday; and two annual fairs for the sale of cattle, held on the second of July, and the second of August.

Somerton was the next town we visited: it is situated in a very healthy part of the county, on a branch of the river Parret, one hundred and twenty-nine miles from London. It is a post-town, and was once the most celebrated in the county, which had its name from hence. The kings of the West Saxons had a castle here, which Ethelbald, king of the Mercians, took by storm. The constablership of it was reckoned a place of considerable trust; for John, king of France, and other state prisoners of the highest rank, were committed to this castle; but time has utterly demolished the whole structure.

The town is governed by a bailiff, chosen annually by the inhabitants. Here is a hall for the petty sessions, an alms-house for eight poor people; and a free school, where Latin, Greek, and Hebrew, are taught.

The chief support of Somerton consists in its fairs and markets for cattle, fed on a neighbouring moor, where there are twenty-thousand acres of good grazing land, on which the inhabitants have a right to keep their cattle. These fairs are held on a neighbouring common, on the Tuesday in Passion-week, Tuesday three weeks after, Tuesday six weeks after, and Tuesday nine weeks after.

The markets are held on Tuesday, for corn and cattle; and every other Monday, for lean cattle. These markets are frequented by the butchers of Bristol, Bath, Wells, Frome, Salisbury, Dorchester, and even from Winchester.

Glastonbury is situated in a peninsula, called the isle of Avalon, formed by the river Bry, and a small nameless stream, one hundred and twenty miles from London.

The abbey of Glastonbury was the richest and most magnificent in the world; and of such antiquity, that it has been called "The first ground of God and the saints in Britain." "The mother of all saints;" and, "The rise and fountain of religion in England." The Saxon kings, and, probably, the British before them, loaded it with revenues; and the abbot lived in almost as much state as the royal donors themselves, with an income of forty thousand pounds a year, and a large tract of rich land, lying round the abbey; together with seven deer parks: the whole being valued, in the king's books, at seven hundred pounds a year more than the archbishoprick of Canterbury. The abbot had the title of lord, and sat among the barons in parliament. The church is said to have been founded by Joseph of Arimathea, about thirty-one years after our Saviour's death; but, however that be, the antiquity of it cannot be questioned, sixty-one abbots having governed it successively for near six hundred years, and enjoyed such power, by a grant from king Canute the Dane, that no person whatever, not even the king himself, durst set a foot in the island of Avalon, without leave. Richard Whiting, who was the last abbot, refused to surrender his abbey to Henry VIII. for which he was condemned at Wells, and drawn, with two of his monks, on a hurdle, to the Tor, where he was hanged, in his pontificalibus, on St. Michael's Tower, his head set on the gate of his abbey, and his quarters disposed of at Bath, Wells, Bridgewater, and Ilchester.

The Torr is a lofty hill, of difficult ascent, overlooking the town of Glastonbury. On the highest part of this hill was an elegant church, built of hewn stones, and dedicated to St. Michael. The tower is still standing, though in a ruinous condition, and, from its lofty situation, is a good sea-mark.

There were, till lately, very magnificent ruins of the abbey, and other venerable structures; but many are now demolished, merely for the stones; though the chief support of the place has long been the concourse of strangers who come hither to view this famous abbey.

The abbey church was large and magnificent; the walls of the choir are still standing. It was one hundred and fifty feet long, and seventy-two broad. One jamb, at the east end of the high altar, is still left; as are also two pillars of the great middle tower, next the choir. On the north side is St. Mary's chapel, the roof of which was pulled down, and a mean one, thatched with stubble, erected in its room, in order to convert it into a stable: the manger lies upon the altar. St. Edgar's chapel is opposite to that of St. Mary, but little of it now remains, except the foundation: it is forty-four paces long, and thirteen wide without the walls. Two little turrets are still standing at the corners of the west end, and two more at the interval of four windows from thence, which seems to indicate the space of ground the first chapel was built upon. The rest, between it and the church, was a kind of ante-chapel. The vault under the chapel is now full of water; and the floor of the chapel, though formed of large stones, beaten down into it. The roof of the chapel was finely arched with rib-work of stone; and the sides of the walls, and other parts of the structure, were full of pillars of Suffex marble, but most of them are now beaten down. All the walls are overgrown with ivy, the only thing that seems to flourish here, every thing else wearing a melancholy, though venerable aspect. The great hall was on the south side of the cloisters.

The abbot's lodging was a fine stone building, but this has been pulled down. The abbot's hall was curiously wainscoted with oak, and painted with coats of arms in every pannel; but this, too, is now destroyed. In short, nothing is left entire but the abbot's kitchen, which is built entirely of stone, in defiance, it is said, of one of our kings, who having been affronted by the abbot,

threatened to burn his kitchen about his ears; to which the abbot answered, "he would build such a kitchen, as all the timber in the forest should not burn:" And accordingly, built the present structure, which has nothing combustible about it, the roof, as well as the walls, being wholly of stone.

There are some other foundations of structures in the great area; but these, it is to be feared, will, like the rest, be soon destroyed, and the materials applied to very different purposes. In every part of the town, we already meet with the tattered remains of doors, windows, bases, capitals of pillars, &c. brought from the abbey, and placed in the meanest cottages.

King Edgar, and several other Saxon monarchs, were buried here; and Mr. Camden makes no doubt, but this was also the place where the famous king Arthur was interred. He tells us, that Giraldus Cambrensis saw his coffin, which was found, in pursuance of a search made for that purpose by order of Henry II. Before the workmen had dug seven feet deep, they came to a large stone, on the inside of which was a cross of lead, with an inscription, in rude characters, to the following effect: "Here lies king Arthur, buried in the isle of Avalonia." In consequence of this discovery, they continued their search, and, nine feet below the stone, they found a coffin of hollowed oak, containing the remains of that great prince.

It will, doubtless, be expected, that we say something of the famous walnut-tree, and holy-thorn, of which so much has been written in the days of superstitious bigotry. The walnut-tree grew in the church-yard, on the hill, and never budded before the feast of St. Barnabas, and, on that very day, shot out leaves in abundance. This tree was certainly nothing more than that species of walnut-tree, called by botanists *Nux sancti Johannis*, from its shooting about the nativity of St. John the Baptist, twelve days only before the feast of St. Barnabas.

The famous haw-thorn is also said to have grown in the church-yard on the hill; that it sprung from the staff of Joseph of Arimathea, who fixed it in the ground, with his own hand, on Christmas-day; that the staff took root immediately, put forth leaves, and, the next day, was covered with milk-white blossoms. It is added, that this thorn continued to blow every Christmas-day, during a long series of years; and that slips from the original plant are still preserved, and continue to blow every Christmas-day to this very time.

That there was in the abbey church-yard a haw-thorn tree, which blossomed in the winter, and that it was cut down in the time of the civil war, is certain; but, that it always blossomed on Christmas-day, is a mere tale of the monks, calculated to inspire the vulgar with the highest notions of the sanctity of this place. There are many of this species of thorn in England, raised from haws sent from the east, where it is common. The ingenious Mr. Miller, in his Gardener's Dictionary, says, "I have, of late years, raised many plants from haws sent from Aleppo, and find them all prove to be what is called Glastonbury thorn: it differs from our common hawthorn, in putting out its leaves very early in the spring, and flowering twice a year; for in mild seasons, it often flowers in November and December, and again, at the usual time of the common sort; but the stories which are told of its budding, blossoming, and fading on Christmas-day, are ridiculous, having no foundation." *Millar's Dict. Art. MESPILUS, 5th Edition.*

Before the dissolution of monasteries, the town of Glastonbury was of great importance, and sent members to parliament; but, upon the destruction of its abbey, it not only lost that privilege, but also ceased to be a corporation, till the reign of queen Anne, who, in the year 1705, presented the town with a new charter for a mayor and burgeses, by whom it is now governed.

Here are two parish churches, but nothing remarkable in their structure. The only manufacture carried on, is that of stockings, the chief support of the town arising from the great resort of people to see the ruins of the abbey.

The George inn is an ancient stone building, and called formerly the Abbot's Inn, from its being a receptacle for

for the multitudes of pilgrims who came strolling hither from every part of the kingdom, under the mask of religion. Over the gate is a coat of arms of the kings of England, supported by a lion and a bull, and decorated with many crosses.

Not many years since, a mineral water was discovered here, and seemed, at first, to promise nothing less than the restoration of the place to its former consideration; but experience has not realized that flattering expectation. This water consists of several united streams, probably impregnated with minerals of a very different nature. The Blood, or Chalice Well, lies near the foot of the hill, on the north side, and has two springs. Somewhat higher, on the same side of the hill, another spring appears, equal, in its mineral properties, to those of the chalice well; and farther, towards the south-west, is another stream, the water of which, from its uncommon softness, seems to be impregnated with lime-stone. All these joining at the foot of the hill, form one stream; which, after running a considerable way through the meadows, seems to be lost among the ruins of the abbey, till it appears again at the Chain Gate.

From a great number of experiments that have been tried on these waters, they appear to be impregnated with steel, allum, and lime-stone; and are found very serviceable in the asthma, dropsy, and all kinds of scorbutic disorders, ulcers, and even cancers.

In the summer of the year 1751, when we visited Glastonbury, the discovery of these waters had been lately made, and the resort of people to drink them was amazingly great. The inhabitants assured us, that above seventeen hundred persons had then taken lodgings in the town, and its neighbourhood; but whether these waters did not answer the expectations formed of them, or whether this great resort was rather owing to fashion than illness, is not easy to say. However, the concourse of people have not since been near so great as about that period.

Glastonbury has a small market on Saturday; and an annual fair, on the eighth of September, for all sorts of cattle.

Having satisfied our curiosity with viewing the ruins of the famous abbey of Glastonbury, we left that ancient town, and passed over a considerable part of a large valley, called Sedgemoor, where we saw multitudes of cattle feeding, to another town, called,

Shipton-mallet, situated on the declivity of a hill, bordering on Sedgemoor, and watered with many rivulets, one hundred and eleven miles from London. It is not incorporated, but governed by a constable, and has a very considerable woollen manufacture. It is a very populous place, and consists of about twelve hundred houses; but the streets are narrow, steep, and irregular. Here is a very good market on Friday; and an annual fair, on the eighth of August, for cheese, and all sorts of cattle.

Wells was the next place we visited. It is an episcopal see, founded in the year 905; but Johannes de Villula, the sixteenth bishop, transferred the see to Bath, and renounced the title of Wells; after which, hot disputes arose between the churches of Bath and Wells, concerning the election of a bishop; but they were compromised about the year 1133, by bishop Robert de Lewis. It was now agreed, that whenever the see became vacant, the bishop should be elected by the canons, both of Bath and Wells, but that the precedency in the title should be given to the former; that he should be installed in both cathedrals, and that both churches should make one full chapter for the bishop. This agreement, however, was not long observed; for the monks of Bath, upon the decease of bishop Robert, chose Roger Champion of Salisbury for their bishop, without even consulting the canons of Wells, and Roger was accordingly consecrated by the pope. This flagrant breach of the agreement renewed the dispute; when, after a long suit, the former agreement was finally confirmed; but Roger was allowed to keep his see, in consequence of his having been consecrated by the bishop of Rome.

The cathedral, which is considered as one of the neatest in England, was built, about the year 704, by Ina, king of the West Saxons, for a college dedicated to St. An-

draw, and endowed with large possessions by that prince, and his successor, king Kinewulph: but this structure was afterwards so thoroughly repaired by Robert Fitz Joceline, bishop of Wells, that it was considered as a new edifice. The west front of this Gothic fabric, though it has now been built upwards of five hundred years, is greatly admired for its imagery and carved stone-work, but particularly for a window, very curiously painted. Adjoining to the church, are spacious cloisters, and an elegant chapter-house, built in the form of a rotundum, supported by a single pillar in the center. The bishop's palace is one of the finest in the kingdom; it is fortified with walls and a moat, and, on the south side, has the appearance of a castle. The chapel is very elegant; it was built by bishop Joceline, and dedicated to St. John the Baptist. Near it is St. Andrew's Well, one of the finest springs in England. Besides the bishop's palace, there is a fine deanry-house, and others for the vicars and prebendaries, in the close; but their common hall is now turned into a music-room, where there are frequent concerts. The members of the cathedral are, a bishop, dean, precentor, chancellor, three archdeacons, viz. of Bath, Wells, and Taunton, a treasurer, a sub-dean, fifty-nine prebendaries, an organist, four priest-vicars, eight lay-vicars, six choristers, and other officers.

In the middle of the city is an old market-house, called the Cross, near which another market-house was, some years ago, erected. The latter is a handsome building, and over it is the town-hall, where the members of the corporation meet, and the judges hold the assizes. Besides the above, there is another town-hall over bishop Babwith's hospital.

The city itself is small, situated at the foot of Mendip hills; on the little river Welve, one hundred and twenty-seven miles from London. It has only one parish church; but the streets are broad, and the houses, especially those near the middle of the city, spacious and handsome. The chief manufactures here are knitting of hose, and making blond-lace; but most of the poor women and children are employed in the former.

Here is a charity-school, erected in the year 1714, for teaching twenty boys and twenty girls. An hospital was founded here by bishop Babwith, for thirty poor men and women; and another hospital by bishop Still, for the maintenance of a few poor women. Mr. Bricks, a woollen-draper, built an alms-house for four poor men; and Mr. Llewelin, another for women. Mr. Archibald Harper, a hosier, also built an alms-house, and endowed it with five hundred pounds, for the maintenance of four poor wool-combers; and Mr. Andrews, a mercer, erected an alms-house for four poor women.

The city of Wells was made a free borough in the time of Henry II. and the charter was ratified by king John, and afterwards raised to a city by a charter granted by queen Elizabeth. It is governed by a mayor, recorder, seven masters, or aldermen, sixteen gownsmen, or common-council, and other officers. The representatives in parliament are chosen by the citizens, admitted freemen in the seven incorporated companies, and returned by the mayor.

Hugh de Wells, archdeacon of this city, founded here, about the beginning of the reign of king John, an hospital, or priory, dedicated to St. John the Baptist, and valued, on the dissolution, at forty-one pounds, three shillings and sixpence *per annum*.

Walter de Hall, canon of Wells, sometime before the year 1347, founded a college for chantry priests, who officiated in the cathedral. This college, at the general suppression of religious houses, was endowed with lands, and other revenues, to the amount of seventy-two pounds, ten shillings and nine-pence *per annum*, and was re-founded by queen Elizabeth.

Ralph Erghum, bishop of Bath and Wells, who died in the year 1401, appointed, by his will, a college to be built here, and endowed for the fourteen chantry priests officiating in the cathedral. His request was complied with, and a college accordingly erected, and endowed with revenues, which, at the dissolution, amounted to one hundred and twenty pounds, one shilling and four-pence *per annum*.

Here are two weekly markets, held on Wednesday and Saturday; and six annual fairs, viz. the thirtieth of May, the twenty-fourth of June, the tenth of October, the fourteenth of October, the seventeenth of November, and the thirtieth of November, for horses, oxen, sheep, and hogs.

About two miles from the city of Wells, and in the lower part of the ridge of mountains, called Mendip-hills, is the famous triple grotto, called Wokey, or Okey-hole. It is the most celebrated cavern in the west of England, and therefore frequently visited by strangers. You ascend the hill, about thirty yards, to the cave's mouth, before which there lies a prodigious stone of an irregular figure. The entrance, which is not remarkably narrow, is about fifteen or twenty feet long, and opens into a very large cavern or vault, resembling the body of a cathedral church, the upper parts of which are very craggy, and abound with pendant rocks, which strike a timorous spectator with terror, especially as they appear by candle-light, and by which they may be very plainly seen, notwithstanding what Mr. Camden says to the contrary. From almost every part of this roof, there is a continual dripping of apparently clear water, though it contains a large quantity of stony particles, as is evident from several stony cones, which were here about thirty years ago, and added greatly to the pleasure of this gloomy scene. The bottom of this vault is extremely rough, slippery, and rocky, and abounds with irregular basins of water; but there are none of those beautiful cones mentioned above, they having been taken away, and presented to the late Mr. Pope of Twickenham, to decorate his artificial grotto, greatly to the disadvantage of this romantic cavern, formed by the hand of nature, without any assistance from art.

From the first vault, you proceed, on a gradual descent, through a very narrow and uneven passage, to a second large vaulted cavern, not altogether so lofty, but in area, and other respects, nearly resembling the first. From this you pass through another long, low, and rocky passage, into a third vault, covered with an arched roof, and on one side a sandy bottom, about fifteen or twenty feet broad, to walk on; and on the other runs a stream or rivulet of water, extremely clear and cold, about eight or ten feet wide, and two or three deep. Mr. Beaumont says, the river, within the cave, is stored with eels, and has also some trout in it; a circumstance we enquired about, but without receiving any satisfaction. This river, after passing through the rock, descends forty or fifty feet to the level ground, where it drives a small paper-mill, situated near the foot of the mountain; and this subterranean river is the first source of the river Ax. At a public-house near this mill, they shew you the draught of a trout taken out of this river, but whether it ever lived in the subterranean part of the water-course, is not known. The stream does not rise perpendicular, but seems to come, in a horizontal bed, from the interior parts of these mountains. We found the air, in all these vaults, to be very cold and damp; and the loudest noise we could make, was not audible to those who were over us, on the surface of the hill.

Leaving Okey-hole, we continued our journey by the side of Mendip-hills, and stopped at Chedder, a small town about five miles north-west of Okey-hole, and pleasantly situated under the very ridge of the mountains. Before the town is a large green or common, on which all the cows belonging to the place are fed. The ground is naturally very rich; and, as most of the inhabitants keep cows, they take care to enrich the soil, by laying on it large quantities of manure. It is a common custom here for several dairies to join their milk, and make one large cheese, weighing one hundred or one hundred and fifty pounds. This cheese is so highly valued, that it generally sells for sixpence a pound on the spot. There are also such large orchards in this parish, that three thousand hogsheds of cyder have been made here in one season; besides which, large quantities of apples have been sent weekly to Shipton Mallet for sale. Two hundred bags of wool are also annually

produced here. The church is handsome and spacious, with a neat tower, and well painted windows. The town has no market; but two annual fairs are held here for the sale of black cattle, sheep and horses, viz. on the fourth of May, and on the twenty-ninth of October.

Near Chedder is a stupendous rent or chasm, quite through the body of the adjacent mountain. It appears as if the hill had been split asunder by the shock of an earthquake, or some dreadful convulsion of nature. The passage is but narrow, though it forms the road leading from this part of the country to Bristol. We walked a considerable distance in this chasm, between the impending tremendous rocks on either side, which, to strangers, exhibit an awful appearance. The tops of some, that stood on the bottom, reached to the very summit of the mountain, though entirely dis severed from the body of the rock. Near the entrance of this chasm is a very remarkable spring of water, rising, as it were, in a perpendicular direction, from the rocky basis of the hill; and, so large and rapid is its stream, that it drives a mill within a few yards of its source, and afterwards falls into the river Ax.

Not far from Chedder is another remarkable cavern, into which you enter by an ascent of fifteen fathoms, among the rocks. This is not so large as Okey-hole; it has no river flowing through it, nor does the water drop so freely from the roof as in most other caverns. In consequence of this, the spar formed here has not so brilliant an appearance as elsewhere: it is, however, worth the attention of the curious, as the strata of rocks, and other substances, convey to a thinking mind several subjects, that convey at once both pleasure and instruction.

Neither this cavern, nor Okey-hole, have any communication with the mines in these hills; though it is well known, that wherever there are mines of lead, there are also caverns, which are various both with regard to their nature and situation, belonging to them. "The most considerable vault I have known on Mendip-hills, (says Mr. Beaumont, *Philos. Tran.* No. 2.) is on the most northerly part of them, in a hill called Lamb, lying above the parish of Harptrey. Much ore has been formerly raised on this hill; and being told, that a very great vault was discovered there, I took six miners with me, and went to see it. First, we descended a perpendicular shaft, about seventy fathoms, when we came into a leading vault, which extended itself, in length, about forty fathoms: it runs not upon a level, but descending; so that, when you come to the end of it, you are twenty-three fathoms deeper, by a perpendicular line. The floor of it is full of loose rocks; its roof is firmly vaulted with rocks of lime-stone, having flowers of all colours hanging from them; which present a most beautiful object to the eye, being always kept moist by the distilling waters. Some parts of the roof are about five fathoms in height; in others, so low, that a man has much ado to pass by creeping. The width, for the most part, is about three fathoms. This cavern crosses many veins of ore in its running, and much ore has been raised from thence.

"About the middle of this cavern, on the east side, lies a passage into another, which runs between forty and fifty fathoms in length; and, at the end of the first, another vast cavern opens itself. I fastened a cord about me, and ordered the miners to let me down; and, after descending twelve or fourteen fathoms, reached the bottom. This cavern is about sixty fathoms in circumference, twenty in height, and fifteen in length: it runs along in the same direction with the veins, not crossing them, as the leading vaults do. I afterwards caused the miners to drive forward the breast of this cavern, which terminates it to the west; and, after they had driven about ten fathoms, they happened into another, whose roof is about eight, and, in some places, ten or twelve fathoms in height, and runs about one hundred fathoms in length.

"The frequency of caverns on these hills may be easily guessed at, by the frequency of swallow-pits, which

“ which occur there in all parts, and are formed by the falling in of the roofs of caverns. Our miners sometimes, by sinking in the bottom of these swallows, have found oaks fifteen fathoms deep in the earth.”

Axbridge lies about two miles from Cheddar, on the river Ax, over which it has a stone bridge, and about one hundred and thirty miles from London. It is a neat, though small town, and formerly sent members to parliament, but that privilege has been lost many years. It was incorporated by Henry VIII. and its charter confirmed by queen Elizabeth and king James I. It is governed by a mayor; recorder, eight burgeses, a town-clerk, and other officers. The corporation are lords paramount of the manor; but there are under-lords, who sit as judges in the court-leet. The mayor has two maces carried before him, one by a serjeant, and the other by a person appointed by the bailiff. The church is a large building; and the tower has two antique statues, one on the east, and the other on the west side. Here is also an alms-house, well endowed, and there was a chantry before the reformation. The market is held on Tuesday; besides which, there are two annual fairs, the first on the twenty-fifth of March, and the second on the eleventh of June; both for cattle, sheep, cheese, and toys.

From Axbridge we passed to Winton, a small town situated among Mendip-hills, one hundred and twenty-five miles from London, and remarkable for giving birth to the famous philosopher, Mr. John Locke. The parish is very large, containing near six thousand acres of inclosed land, and five thousand of common. The church is a handsome structure, and has a lofty tower, adorned with four pinnacles. Here is a small charity-school, and a pretty large market, on Tuesday.

We have already observed, in our account of the Somersetshire husbandry, that prodigious quantities of teazles grow in the neighbourhood of this place; and, not far from hence, are also the mines of Lapis Calamariis, already described among the mines of Devonshire.

Bristol was the next place we visited; a city justly considered as the second in the kingdom, for trade, wealth, and number of inhabitants. It stands on both sides of the river Avon, one hundred and fifteen miles distant from London, and was made a county of itself in the reign of Edward III. It was incorporated in the reign of Henry III. but is governed, pursuant to a charter of Charles II. by a mayor, a recorder, twelve aldermen, and forty-two common council-men. It is the see of a bishop; and the tradesmen of the city are incorporated into several companies, each of which has a hall, or some large room, for their meetings: and, by a charter of queen Elizabeth, every man that marries the daughter of a citizen of Bristol, becomes free of the city.

Mr. Camden is of opinion, that Bristol rose on the decline of the Saxon government, because it is not taken notice of before the year 1063, when Harold failed from Brightstow to invade Wales: yet, we can hardly doubt, but this place was considerable in the Saxon times, by the name of Brightstow; for we read of one Harding, a younger son of the king of Denmark, who was governor of Bristol in the reign of Edward the Confessor. The castle was built by Edward earl of Gloucester, natural son to Henry I. in the reign of king Stephen, who besieged it before it was quite finished, but was obliged to withdraw his forces, and, not many years after, sent prisoner to it. The empress Maud, when she came into England to contend with Stephen for the crown, was here received and entertained by the earl of Gloucester, who was then in possession of Bristol-castle. During the civil war, it was alternately in the hands of the king and parliament, and at last demolished by Cromwell; and the site of it now built into streets, the chief of which, called the Castle, is very well built; and, parallel to it, runs Castle-green, on which are many very handsome houses.

In the year 1362, the staple of wool, which king Edward III. had, from some disgust, removed from the towns in Flanders, was established in this, and other great cities.

The cathedral church of this city is situated on the north side of the river Froome, on what is called Colledge-green. It was formerly the collegiate church of an Augustine monastery, founded, in the year 1148, by Robert Fitz-Harding. Upon the dissolution of monasteries, it was erected into a bishop's see by Henry VIII. who applied the revenues of the convent to the maintenance of a bishop, a dean, six prebendaries, and other officers: but there is nothing worth notice in the structure.

Besides the cathedral, there are eighteen parish-churches, and seven or eight meeting-houses of protestant dissenters; among whom, the people called Quakers are a very considerable body, both for number and wealth.

The chief parish-church in this city is St. Mary Radcliff. It is situated without the walls, in the county of Somerset; and was built, in the reign of Henry VI. by William Cannings, an alderman of this city. It is a magnificent structure in the Gothic taste; the workmanship so exquisite, the roof so artificially vaulted with stone, and the tower so lofty, that it may, perhaps, be esteemed the finest parish-church in England. It stands on the brow of a hill, and has a stately ascent to it by stone steps. In it are two inscriptions to the memory of the founder. On one side of the church he is represented in the habit of a magistrate, to imply his having served this city as mayor; and, on the other, he appears in ecclesiastical robes, having entered into holy orders in the latter part of his life. One of the inscriptions is in Latin, the other in English. Here is also a monument erected to the memory of Sir William Penn, knight, vice-admiral of England, and father of the great William Penn, one of the heads of the Quakers, who was a native of Bristol. The altar-piece is finely painted, partly by the excellent pencil of Sir James Thornhill.

Temple-church stands in a street of the same name, and is remarkable for having a tower, leaning considerably to one side. Mr. Camden tells us, that the tower shook whenever the bells in it were rung; and that a visible chink, from bottom to top, was then visible, and narrower or broader according to the motion of the bells.

St. Stephen's church is also elegant, and has a very beautiful and stately tower; but, it is so closely surrounded with houses, that great part of the beauty is lost.

The church of All Saints, near the Exchange, has a steeple in imitation of that of Bow-church in London.

In the session of parliament held in the year 1751, an act was passed, “ For dividing the parishes of St. Philip and St. James, in this city and county, and “ for erecting a church in the new-intended parish;” the preamble to which recites, “ That the church was “ not large enough to contain the inhabitants.” And, in order to promote that good intention, Thomas Chester, Esq; lord of the manor, gave a piece of ground; and Dr. Butler, sometime bishop of Bristol, gave four hundred pounds towards the maintenance of the new vicar; besides which, he obtained four hundred pounds more from the governors of queen Anne's bounty, to be applied to the same purpose.

This act was, soon after, carried into execution. On Tuesday the third of March, 1752, David Pelloquin, Esq; mayor, attended by the aldermen, and several others of the commissioners appointed for building the new church, went, in their coaches, to the spot of ground marked out for that purpose, and laid the first stone of that structure, putting under it several pieces of his late Majesty's coin, the upper part of it having the following inscription:

*Templum hoc
Dei Opt. Max. Gloriæ,
Et Hominum indies peccantium Salutis
Sacrum,
Erigi voluit Pietas publica.
Absit tamen,
Quod inter ignota Nomina*

O

Reverendz

Reverendi admodum in Christo Patris
 JOSEPHI BUTLER,
Nuper BRISTOLIENSIS Episcopi,
 Lateat Nomen!
 D. D. D. 400l.
Jam tum ad Dunelmenses migraturus.

This Church,
 Sacred to the All-mighty and All-gracious God,
 And the Salvation of frail Sinners,
 Was erected by the Public Piety.

Yet,
 Far be it from us to conceal,
 Among obscure Names,
 The reverend Father in God,
 JOSEPH BUTLER,
 Late Bishop of Bristol,
 Who
 Consecrated to this pious Use,
 Four Hundred Pounds,
 When just translated to the See of Durham.

On the lower part of the stone was this inscription :

Regnante Georgio Secundo,
Justo, Clementi, Forti,
Angulare hunc Lapidem,
 5 Non. Mart. 1752.

Posuit
 David Pelloquin, *Civitatis Bristol. Prætor.*

In the Reign of George II.
 The just, the gracious, and the valiant,
 On the 5th of March, 1752.

This corner-stone was laid
 By David Pelloquin, Mayor of the City of Bristol.

We cannot here omit one observation we made when we visited the churches at Bristol, much to the honour of the citizens; we mean, the neatness observed in their structures dedicated to religion, and the care that is taken in preserving the monuments, and inscriptions on them to the memory of the dead; a practice scandalously neglected in most other places in England. This care of the monuments of the deceased draws to their churches many strangers, who are always pleased with it, and too often draw comparisons very little to the credit of other places. How often do we see a monument, erected at a great expence of the family, suffered to decay, and the very inscription, intended to perpetuate the memory of the deceased, obliterated, though professedly dedicated to posterity; by which means, it becomes rather a monument of the ingratitude and neglect of the survivors, than an honour to the deceased.

In this city there are no less than eighteen charitable foundations, generally called Hospitals, viz.

1. Queen Elizabeth's hospital, which, before the dissolution of monasteries, was a collegiate church, founded by Sir Henry Gaunt; but afterwards converted into an hospital by T. Carre, a wealthy citizen, who is supposed to have lived in the reign of queen Elizabeth, and to have given her name to this hospital. In the year 1706, it was rebuilt, and further endowed with contributions, and is now large enough for one hundred boys: they are taught reading, writing, arithmetic, navigation, &c. and, when they are qualified to go out, are at liberty to chuse a master, either for land or sea-service, and have eight guineas given with them, as an apprentice-fee. Six of these boys, who are upon Mr. Colston's establishment, have ten pounds given with each. The mayor and aldermen are the visitors of this seminary, and by them the treasurer is chosen. The boys maintained by this charity, are dressed nearly in the same manner as those of Christ's Hospital in London.

2. Colston's hospital, on St. Austin's Back, founded by Edward Colston, Esq; for one hundred boys, who are taught and maintained in this hospital seven years, when they are put out apprentices, in the same manner as those in queen Elizabeth's hospital. The master is allowed one thousand pounds a year for the maintenance

of these boys. The founder purchased lands in several parts of Somersetshire, and settled the revenues on this foundation. The merchants company are the receivers of these rents, and also inspectors of this charity. Eighty of these boys must be the sons of freemen of Bristol, but the other twenty are from different parts of the county. They are dressed like the former, except their caps, which are black; and the lining of their blue coats of an orange colour, whereas those of the former are white.

3. Colston's Hospital on St. Michael's Hill. This hospital was founded by the above Edward Colston, Esq; in the year 1691, at the expence of twenty-five thousand pounds. The front and sides of the building are faced with free-stone; and contains twenty-four apartments for twelve men and twelve women, who have each an allowance of three shillings a week, and twenty-four sacks of coals a year: the elder brother has six shillings a week; and the governor has an apartment and garden, with a handsome allowance. There is a neat chapel belonging to the hospital, where prayers are read twice every day, except when they are read at St. Michael's church, and every pensioner is obliged to attend.

4. An hospital adjoining to the merchants hall, in King-street, founded partly by Edward Colston, Esq; and partly by the merchants, for thirty poor men and women. Each of the pensioners has two shillings a week, besides coals.

5. A large school and dwelling-house in Temple-street, built and endowed by the above Mr. Colston, who purchased the ground for it in 1696. Here forty boys are taught reading, writing, and arithmetic, and clothed in short grey habits, with caps and bands; but their parents find them necessaries. The master's salary is paid out of the vestry of that parish, by persons who have the entire management of the school.

6. Foster's Hospital, situated on St. Mary's Hill, for six men and eight women, who are allowed two shillings a week each.

7. St. Nicholas's Alms-house, situated in King-street. It was founded by Mr. Daniel Adams; and consists of sixteen rooms, inhabited by thirteen women and three men, who have each an allowance of one shilling and ten-pence a week.

8. An alms-house in Peter-street, built by alderman Aldworth, for eight widows; but they have no allowance.

9. Merchant Taylors hospital, in Merchant-street, where two men and nine women have each two shillings and sixpence a week, besides a dinner, and one shilling a piece, once a quarter.

10. St John's Hospital, situated in the Old Market, for twelve women, who are allowed two shillings a week each, besides a sack of coals, and one shilling a piece at Christmas.

11. Another hospital, built opposite to the former, for twelve men and twelve women, who are allowed two shillings and four-pence a week each, besides washing. These two hospitals are said to have been founded by one Mr. Barnstable.

12. Alderman Stephens's hospital, situated in the same street, for twelve women, who have one shilling and six-pence a week each.

13. An hospital on Radcliff-hill, said to have been founded by Sir William Penn. Some of the poor in this house have an allowance, others none.

14. An hospital, or work-house, built by the people called Quakers, near the Narrow Weir.

15. Dr. White's hospital, in Temple-street, for nine men and three women, who have each an allowance of two shillings and sixpence a week, and gowns once in three years.

16. A Bridewell, between Wine-street and St. James's; and, adjoining to it, a work-house, called Whitehall.

17. An old alms-house without Temple-gate, inhabited by fourteen poor people, but without any allowance.

18. St. Peter's hospital, opened on the twenty-ninth of June 1738. It is an infirmary for the sick and distressed poor of this city, established on the same plan as those of London and Westminster. Very liberal contributions

I believe this book was taken in parts by my great grandfather
and many years afterwards his son (my grandfather) had them bound -
thence the water marked paper. 1799. fly leaves an more recent date than
the date of publication. -

17. An old alms-house without Temple-gate, inhabited by fourteen poor people, but without any allowance.

18. St. Peter's hospital, opened on the twenty-ninth of June 1738. It is an infirmary for the sick and distressed poor of this city, established on the same plan as those of London and Westminster. Very liberal contributions

butions have been made towards supporting this useful charity; particularly, by the late John Elbridge, Esq; comptroller of the customs here, who, besides several other charitable donations, bequeathed five thousand pounds to this infirmary. He had, some time before, built and endowed a charity-school on St. Michael's-hill, for educating and cloathing a certain number of poor girls.

The walls of this city were partly razed in the time of William Rufus; but some portion of them still remains, and called the Portwall, between Harrez-tower, on Temple-back; and the glass-house, on Radcliff-back, near the Avon. This wall has two gates, Radcliff-gate, and Temple-gate, erected at the end of two long streets of the same name; and between which St. Thomas's-street runs, in a parallel direction, towards the bridge. The other gates are that of St. Nicholas, at the north end of the bridge, over which is the tower of St. Nicholas's church; Backstreet-gate, and Marsh-gate, leading to Queen-square; St. Leonard's and St. Giles's gates, leading from Corn-street and Small-street, to the quay; St. John's gate, and its tower over it, at the lower end of Broad-street; Needlefs-gate, leading to Broad-mead; the Pithay gate, leading to St. James's church-yard; Froome-gate, leading to the College, and St. Austin's-back, or quay; Newgate, at the lower end of Wine-street, the prison both for debtors and malefactors; and Castle-gate, where the castle formerly stood, leading to a very broad street, called the Old Market, which terminates at Lawford's-gate, the entrance from the London and Gloucester roads.

The situation of this city is low, but on the declivity of a hill. The ground-plot of it is said to resemble that of ancient Rome, being nearly circular, and divided into two parts by the Avon. The part on the Gloucestershire side of the city is four miles and a half in circumference, and that on the Somersets-hire side two miles and a half; so that the whole circumference of the city is seven miles. It is supposed to contain thirteen thousand houses, and ninety-five thousand inhabitants.

The north and south parts of the city are connected by a stone bridge over the Avon, consisting of four lofty and spacious arches; but the passage over it is encumbered with houses built on each side of it, which renders the passage on foot not only inconvenient, but dangerous, there being no room for posts, to prevent accidents.

The streets are narrow, ill-paved, and irregular; and the houses, in general, built like those in London, before the fire in 1666, with the upper floors projecting beyond the lower; they are also crowded close together, and many of them five or six stories high. The ascent to St. Michael's-hill is so steep, that near an hundred stone steps are laid in the ground, at proper distances.

They draw all their heavy goods here upon carriages without wheels, called Sleds or Sledges; for carts are not allowed to be used, for fear of shaking and damaging the arches of the vaults and sewers, or subterraneous passages, for carrying the filth of the city into the river. This renders the pavement so very smooth and slippery, that it is dangerous walking in frosty weather.

The place which, in Camden's time, was called the Marsh, and had rope-walks all round it, is now called Queen-square, it having, of late years, been surrounded with very good houses, inhabited by gentry and merchants. The houses are fronted partly with brick, and partly with stone, and the square reckoned larger than any in London, except Lincoln's-inn-fields. On the north side of it is the Custom-house, and the area laid out in walks of trees, which lead to a curious equestrian statue of king William III. placed in the center, and executed by the famous Mr. Ryfbrack.

The guild-hall, where the sessions and assizes, as well as the mayor and sheriffs courts, are held, is situated in Broad-street; and, adjoining to it, is a spacious lofty room, called St. George's Chapel, in which the mayor and sheriffs are annually chosen. In the front of the guild-hall is a figure of king Charles II.

At the upper end of Corn-street is a new council-house, where the mayor and aldermen meet every day, except Sundays, to administer justice; and below it is the

Tholsey, where there are several short stone pillars; having their tops covered with broad brass plates, with inscriptions on them: they were erected by the merchants, for the benefit of writing, or counting money; for here the merchants formerly met, and transacted business, as they do on the Royal Exchange in London.

But, as their meeting in the open air not only exposed them to the weather, but also to the noise of sleds and coaches passing to and from the quay; the citizens obtained an act of parliament, in the year 1733, for building a regular Exchange. This act was soon after carried into execution; and, on the tenth of March 1740-1, the first stone of the edifice was laid by the mayor, with great ceremony, several pieces of gold and silver coin placed under it, and on it the following inscription:

Regnante GEORGIO II. Pio, Felici, Augusto Libertatis et Rei Mercatoriae, Domi Forisque Vindice, primariam Lapidem hujusce Aedificii Suffragio Civium, et Aere publico extracti, posuit Henricus Combe Praetor, A. C. MDCCXL.

“ In the reign of George II. the pious, prosperous, august vindicator of liberty and commerce, both at home and abroad, Henry Combe, mayor, A. D. 1740, laid the first stone of the edifice erected by the vote of the citizens, and at the public expence.”

This edifice was opened, with great ceremony, on the twenty-third of September 1743, and is esteemed the completest of its kind in Europe. It is built wholly of free-stone, has four entrances into it, and rooms for shops over it, like the Royal Exchange, and is about two thirds as large. At the grand entrance, are two spacious apartments; one for a tavern, and the other for a coffee-house. The building of this edifice, together with the purchase of the ground, and old buildings destroyed, cost the corporation near fifty thousand pounds. But, we cannot help observing, that this elegant structure, which the city had, for ages, laboured to procure, and which, when completed, obtained the universal approbation of strangers; this very structure was no sooner presented to the trading part of the city, for their free use and convenience, than the body of the people refused to assemble there; and shewed a much greater inclination to the common street, where, to their reproach be it spoken, they now assemble, mixing themselves with the refuse of the city, as if they did not dare to appear in the Exchange among the most respectable merchants.

The quay, which is on the river Froome, is near half a mile in length, from a draw-bridge over the stream, to its conflux with the Avon, and, perhaps, the most commodious in England for landing and shipping of goods. The cranes on this wharf are very excellent in their kind, and constructed by the late ingenious Mr. Padmore. These machines are of great use to the merchants, as ships are cleared with very great facility. A handsome row of houses fronts this quay, and on it is a very fine sun-dial. The draw-bridge, already mentioned, preserves the communication between the parts of the city on both sides of the Froome, and is drawn up gratis by officers paid by the city, for the admission of ships with the tide, which rises here five or six fathoms on spring-tides.

At the upper end of High-street, a beautiful cross was erected in the year 1373, and which, in succeeding times, was adorned with the statues of four kings, who had been benefactors to the city. These faced the four cardinal streets; that of king John to the northward; king Henry III. eastward; king Edward III. westward; and Edward IV. southward. In 1683, it was taken down, enlarged, and raised higher; and four other statues added; namely, king Henry VI. to the eastward; queen Elizabeth to the westward; king James I. to the southward; and king Charles I. to the northward. Some time after, it was removed from its original situation to College-green, where it now stands, environed with iron palisadoes, painted and gilded. The height of this structure is thirty-nine feet six inches. College-green, in the middle of which this cross is placed, is situated on the north side of the river Froome, and reckoned the healthiest situation in the whole city.

In Wine-street is a large corn-market, built of free-stone, and a guard-house adjoining to it, with barracks for soldiers.

A few years since a new, and very elegant theatre, was erected in this city, where many of the principal actors from London, perform during the summer.

The trade of this city is considered as the most considerable of any port in the British dominions, London excepted, especially to the West Indies, to which its merchants were the first adventurers; and is said to employ near five hundred sail of ships in that trade only. Even before the civil war, the merchants of this city had a very considerable trade to the West-Indies, and which they have very greatly increased, not to that quarter only, but to most of the parts of the known world, since the revolution. Before that period indeed, they knew little of the Guinea trade, and hardly any thing of the Dutch, the Hamburgh, the Norway, and the Baltic commerce; all which have since been very flourishing in this port.

The merchants of Bristol have not only the greatest trade, except that of the capital, but they also trade with less dependence upon London, than any other town in Britain. Whatever exportations they make to any part of the world, they can dispose of the full returns; which is not the case with any other port in England; where they are often obliged either to ship part of the returns from ports abroad, in ships bound to London; or to consign their own vessels to London, in order both to get freights and dispose of their cargoes. But the Bristol merchants have always buyers at home for their returns, and so many of them that no cargo is too large. In consequence of this home consumption the shopkeepers in Bristol, who are in general wholesale dealers, have so great an inland trade, among the western counties, that carriers continually pass and repass from hence to the principal towns.

Add to this, the navigation of the two great rivers, the Wey and the Severn, whereby they engross, as it were to themselves, the whole trade of South Wales, and the greatest part of North Wales, as well as the English counties bordering on these rivers. Their trade with Ireland, which is vastly increased since the revolution, is prodigious, notwithstanding the great trade carried on with that kingdom by the merchants of Liverpool.

Here are some considerable manufactures of wollen stuffs, particularly Cantaloons; and not less than fifteen glass-houses, for manufacturing plate glass, drinking-glasses, &c. particularly bottles, for which there is a great demand at the Hot-well, and Bath, for exporting the mineral waters at these places.

These glass-houses are supplied with coals from the pits at Kingswood, and Mendip-hills; and it is remarkable, that though coals are brought some miles by land carriage, yet they are generally laid down at the doors of the inhabitants at seven, eight, or nine shillings per chaldron.

Here are thirteen incorporated companies, viz. 1. the Merchant-adventurers, who have a handsome hall, and lands to a considerable value. 2. The Merchant Taylors, who have a very large hall, lately rebuilt of free-stone; it is near seventy feet long, and of a proportional breadth. 3. The Mercers. 4. The Soap-boilers and Chandlers. 5. The Tobacconists. 6. The Butchers. 7. The Barber Surgeons. 8. The Tylers. 9. The Holliers, or Carmen. 10. The Shoemakers. 11. The Coopers. 12. The Bakers. 13. The Smiths. All these have halls of their own or hire large rooms for their meetings.

The city is supplied with water by several public conduits, viz. one in Bread-streed, one in Corn-street, one at the Fish-market, near the end of the quay, another at St. Austin's back, one in Peter-street, one in Temple-street, and another in Thomas-street.

Near the city is a hill called Brandon-hill, made use of by the laundresses for drying their linen, which is carried thither upon sledges, and the ground is said to have been given to the city for that purpose, by Queen Elizabeth. At the foot of this hill is a spring called Jacob's well, and near it the old theatre were plays were

acted some years since during the summer season. It was built for that purpose by the late celebrated comedian Mr. Hippisley, who was a native of Bristol. But since the new theatre has been erected, the old house has been laid aside. Near the old theatre is a very handsome assembly room, where the company meet in the summer; and the old theatre in Stokes-croft, is also changed into an assembly-room, which is open every Tuesday during the winter.

On the 25th of August 1747, there happened here a violent storm of thunder, lightning and rain; and what was very surprizing, the bushes on the hill, near Jacob's well, were observed to be suddenly on fire, and continued burning for some time even after the storm was over, though it rained violently. It is imagined they were set on fire by the lightning, which rushed down in an astonishing manner. The northern light, or *aurora borealis*, was exceedingly luminous, darting forth its corruscations of pale light, which seemed to rise from the horizon in a pyramidal, undulating form, shooting with great velocity up to the zenith.

In the North suburb of this city, Robert, earl of Gloucester, and natural son to Henry I. built a priory of Benedictine monks, dedicated to St. James, and made it a cell to the abbey of Tewksbury in Gloucestershire.

Here was also a college called the Calendaries, being a fraternity of the clergy and commonality of Bristol, before the reign of Edward III. This Society was valued upon the suppression at ten pounds eighteen shillings and eight pence *per annum*.

In the year 1148 Robert Fitz-Harding, mayor of Bristol, founded a priory of Augustines, dedicated to St. Augustine; and towards the reign of Henry II. changed it into an abbey, whose yearly revenues, at the dissolution, amounted to six hundred and seventy pounds thirteen shillings and eleven pence. This abbey had a church, which Henry VIII. when he suppressed the priory, erected into a cathedral, by the name of the cathedral church of the Holy Trinity.

On the North side of the city was a nunnery, dedicated to St. Mary Magdalen, and said to have been founded by Eva, the widow of Robert Fitz-Harding, in the reign of Henry II. It was valued upon the dissolution at twenty one pounds, eleven shillings, and three pence, *per annum*.

In the suburbs, on the Gloucester side, there was an hospital for lepers, erected some time before the eighth year of the reign of Henry III.

A house of Black friars was founded here by Sir Maurice Grant, about the year 1228.

A house of Grey friars was also founded in this city before the year 1234; and a priory of White friars, in 1297, by king Edward I.

Near the Temple-gate stood a house of Augustine friars, founded by Sir Simon and Sir William Montacute, about the beginning of the reign of Edward II.

The principal markets in the city are held on Wednesdays, Fridays and Saturdays; besides which there is a market every Thursday in Thames-street, for cattle. Here are also two annual fairs held on the twenty-fifth of January, and the twenty-fifth of July, for all sorts of goods. The latter of which is called St. James's, or the summer fair, is held on the Gloucester side, about St. James's church-yard; and the former, called St. Paul's, or the winter fair, is held in Temple-street, on the Somersetshire side. These fairs hold some time, and many of the Londoners have shops in both.

About two miles from the city of Bristol are St. Vincent's rocks. A vast and irregular heap of stones, of different kinds; but their general substance is limestone, and extremely hard.

Among this pile of rocks, is one particularly remarkable, and out of which issues the famous water called the Hot-well water, and sometimes Bristol water. This rock is situated on the North-side of the river Avon, and affords a prospect at once romantic and beautiful.

As this water passes through a vast bed of rocks, and a variety of different substances, it doubtless borrows its taste and virtues from the most particular kinds; and,

and, when drank at the spring-head, has a fine gentle warmth, and a delicate, soft milky taste; it is very grateful to the stomach, and extremely serviceable in many complaints.

It is generally allowed to be cooling, cleansing, and balsamic; but, one of its most remarkable qualities is, its gentle astringency: this renders it useful, if not a specific, in that terrible complaint the diabetes; and, in consequence of its other qualities, it is drank, with great success, in obstructions of the urinary passages from gravel; as also, in many chronic cases, from which very little relief can be hoped by the common course of medicine.

Its cooling quality renders it of great use in internal inflammations; and, by its astringency, it strengthens the stomach, promotes an appetite, and assists digestion; and, at the same time, does not affect the taste of the food, a circumstance too common with mineral waters, and which renders their use disagreeable.

When the lungs are too much affected, its use is to be avoided; but, in the first stages of those fatal distempers, it will prove of the utmost service.

Besides the internal use of this water, many persons, who have weak and inflamed eyes, find great benefit from it: they take it warm from the pump, in some little cup; and, with a bit of soft rag, wash their eyes pretty often with it: this, in time, cools the part, takes off the inflammation, and greatly strengthens the sight.

There is also another advantage attending the hot-well, and from which many people have received great benefit; we mean, bathing in the water. In order to this, several little baths, for one person at a time, are constructed near the well: these baths are chiefly frequented by those afflicted by some kind of weakness. When persons first make use of these baths, they imagine it rather weakens than strengthens them; but a little perseverance sufficiently convinces them of their mistake, as they find, by happy experience, that they gather strength every day.

Many persons in health often make use of these baths, in order to refresh themselves: The water which fills these little baths, is the same with that which is drank; but, by the time it is pumped up, through the cold leaden pipes, into these stone baths, very little warmth can be perceived. These baths are usually bespoke over night by those who chuse to bathe early, and they are sure to find them ready at the hour appointed, for which they pay one shilling each time, the bath being fresh filled for every person.

The method observed in drinking these waters, is this: at first coming, the person goes to the pump-room in the morning, and drinks a glass or two before breakfast; and returns about five in the afternoon, when one or two more are drank. The next day, he takes three glasses before breakfast, and three in the afternoon, and this he continues during his whole stay.

Each of these glasses holds the third part of a pint; but, it must not be supposed that the patient drinks three of these glasses of water, one immediately after the other; half an hour, by the pump-clock, is the time allowed between glass and glass; and, during this interval, he either continues in the pump-room, where there is a good band of music during the season, or walks by the side of the Avon, where he is diverted by the number of ships and vessels passing up and down with the tide, which runs here very rapidly. The taste of the water is so agreeable, that the drinking this quantity is far from a task; 'tis universally done with pleasure, and many are as fond of it as of wine.

Besides the six glasses already mentioned, several take an additional glass an hour before dinner, which many have found useful; but this is not universal, nor should it be done but when the water increases the appetite.

Some also send for the water to their lodgings, and drink it, either alone, or mixed with their wine, and make their tea with it. By this method, the advantages arising from drinking the waters are increased.

Every thing conspires to render the drinking of Bristol water agreeable. The accommodations of all kinds are excellent; the people, in general, obliging; and those

belonging to the hot well, particularly so. There is always good company during the season, which lasts from April to September, and many innocent diversions and amusements. For those who love riding, there is one of the finest countries in the world: the downs are spacious and open, and the air pure and healthy; at the same time, the eye is delighted with the most agreeable prospects. The vast sheet of water, called King-road, at the mouth of the Avon, exhibits a very beautiful scene, from the number and variety of ships and vessels with which its surface is often covered; while the Welsh mountains, with their heads in the clouds, terminate the view.

Upon the hill, at the foot of which the hot-well is situated, stands Clifton, one of the most agreeable villages in the kingdom. Here many of the company, that frequent the hot-well, have their lodgings. The prospect from this village and the adjoining mount is beautiful beyond description; and the air of this particular spot so excellent, that it has been called the English Montpellier.

The company frequenting the hot-well is often very numerous; and to that particular, the agreeableness of the place is, in some measure, owing. But all who have experienced the benefit of these waters, often wonder that the company is not still more numerous.

Every fine Sunday, indeed, during the summer, the place is crowded during the whole day, prodigious numbers of people coming from Bristol, and every other part of the adjacent country, to drink the waters; but these go in at a back-door, and do not interrupt the better sort of company.

To whatever principles these waters owe their virtues, it is sufficiently evident, that they are intimately connected with their substance; for, when a gallon of Bristol water has been evaporated, there scarcely remains any thing in the vessel; whereas there remains, after the evaporation of other medicinal waters, a salt, or other substance, possessing the same virtues. This abundantly proves, that the virtues of Bristol water are inherent, and not owing to any accidental mixture with it; and, for that reason, it keeps better than any other medicinal water whatever. Vast quantities of air-bubbles rise in a glass of it fresh filled, and exposed to the sun; which has induced some to assert, that its virtues are owing to its being impregnated with air.

But, to whatever principle its virtues are owing, it is evident, that the spring must be supplied from some vast resource. Like most other fountains, it rises in wet weather, and falls in dry; so that it has many things in common with waters of much less virtue. But it must be observed, that they are obliged to leave off pumping a few hours in the day, always a day or two before, and two or three days after every new and full moon.

This is, however, entirely owing to the accidental situation of the spring near the bed of the Avon; so that on spring-tides the salt water from the river Avon generally rise high enough to break in upon the hot-well spring, except in times of great rains, when the spring is very full, and thence, in a great measure, it resists the spring-tides; so that they affect it very little.

This formidable disadvantage in appearance, is, in reality, but very trifling: the spring is so considerable, that it will bear continual pumping; and a very few hours of this, even in the very worst of times, renders the water as bright and pure as it was before the accident.

There is something at once both very singular and very striking in the nature of this spring. The face of the adjacent country is the very same to a great extent: the rocks run all over it in the same manner, the bed of the Avon itself being nothing more than a cut through them, and not any real separation of one kind of soil or country from another. Yet, though we see, on the other side of the Avon, the same kind of rocks, composed of the same kind of lime-stone, and every way similar to those on this side, out of which the hot-well issues; and, at the same time, perceive springs issuing from them in the very same form and manner; yet, the waters of these springs have not the least affinity; that of the hot-well being warm, soft, and medicinal; while that facing it, on the opposite shore, is as hard, cold, and simple spring-water, as any in the world.

It seems evident, that the true source of the virtues of Bristol water, is that prodigious rock of lime-stone through which it runs before it reaches the hot-well. We know the qualities of lime-stone; and we also know, they are such as would give the very same virtues to water, as those of Bristol possess: it is therefore highly reasonable to conclude, that they derive their virtues from those amazing quantities of lime-stone rocks, which extend to a great distance round the hot-well. But, at the same time, we see water issuing from the same rocks, on the other side of the Avon, without the least mark of possessing any quality more than what is found in common spring-water. This is very singular, and would almost induce one to think, that nature has not suffered this water to wash the very rocks among which it passes.

We have already observed, that the rocks near the hot-well are composed of that hard matter called Lime-stone, and which is used for burning into lime. They are a kind of marble, but considerably harder than the common kinds, and of a closer grain. They take a good polish, and look very beautiful. The polished chimney-piece in the pump-room at the hot-well, is cut out of one of these rocks, and makes a very elegant appearance. There is some variety in the colour of these rocks, but it is, in general, dark and dusky: a slate or lead colour, with a blueish cast, is the most common; but some have a black ground, streaked or spotted with white.

The people who live in the neighbourhood are permitted to take any quantity of these rocks, which are blown up for these purposes by means of gunpowder, and for which the men, who get their livelihood by this business, are allowed six-pence or seven-pence a ton, the employer finding tools and gunpowder.

The method they take is very simple, easy, and effectual. Two men are generally employed for this purpose; one of whom holds in his hand the boring-tool, or bar of iron, having its point formed into a kind of chissel; and the other a hammer.

The person who manages the boring-tool, takes, at first, one of about two feet in length, fixing the point of it upon such a part of the rock as he thinks will best suit his purpose; and the other strikes on the other end of it with a hammer. The blows are repeated; and the bar being turned every time the person strike, it makes its way into the stone. When a small hole is made, they pour water into it; and, as they go on boring, they, from time to time, clean out the hole, in the same manner as they clean a gun-barrel. The bar of iron, or boring-tool, is about three inches in circumference; and, by this manner of working it, a hole is made something larger than itself, and of a depth nearly equal to its length. They then take a longer bar, and so on, to their longest, which is six feet, if the nature of the rock they are at work upon requires it; the depth of the hole being always in proportion to the quantity of stone they propose to remove.

When the hole is thus made of the depth they chuse, they clean it well out, and make it dry; then they put in a quantity of gunpowder, proportional to the hole they have made in the rock; sometimes not more than half a pound, and sometimes two or three pounds. When the powder is put in, they thrust down a small wire, and leave it in the hole, extending from the powder to the surface; and then make up some very stiff clay, or other substance of that kind, and ram it into the hole extremely firm, filling the top of the hole entirely, and in the strongest manner. The clay, &c. being firmly fixed, they draw out the wire, by which a touch-hole is made quite down to the powder; they fill this touch-hole also with powder, lay a train from thence to a considerable distance, and a piece of lighted touch-wood at the extremity, leaving it to take effect.

Care must be taken to retire, for the effect of the gunpowder is very violent. Some tons of stone are generally loosened by the blast; and, frequently, pieces of two or three pounds weight are thrown, like cannon-shot, to a considerable distance.

They are not, however, always alike successful in these blows, as they call them; for though they some-

times loosen many more tons at a blow than they expect, yet they as often miscarry.

Among the rocks in this neighbourhood, there are found great quantities of small crystals, generally known by the name of Bristol-stones. They are, for the most part, clear and colourless; a few are tinged, but the colours are faint, and seem accidental. They are naturally as well polished as if they came from the hands of the lapidary; and are found in vast numbers in the cracks of the rocks, and chasms of stones, but chiefly in the cavities of iron ore. They are principally used in embellishing grottos, &c. for which they seem admirably adapted.

They are found, in great variety of forms, in different places, and the clusters of them are still more various in their appearance. About Clifton, they resemble table-diamonds; and some of them, where the pyramids stand upright, and are broad and short, have, at first view, the appearance of rose diamonds. In some places, the clusters are small, short and numerous; and in these the angles are so many, and the light so variously reflected, that they appear like clusters of small brilliants set in some large piece of work by a jeweller. Perhaps there are few pieces of art that equal these clusters in beauty, when the light falls properly upon them.

About King's Weston, the clusters rise higher, and are more irregular, the small shoots being so blended one with another, that the particular form of each is lost; but the appearance of the whole is very romantic and beautiful. Several of these are of the strangest figures that can be conceived; some shoot up in the form of the large teeth of animals, while others resemble the spires and turrets of old cathedrals, and the ornaments of Gothic buildings.

Though these stones generally adhere to the rock or ore at one end, and terminate in a point at the other; yet, this is not universal: some lie flat, and grow to the stone on one side, and are pointed at both ends. Besides these, there are two other sorts, which differ only as the column is longer or shorter. In some it is very long, and the whole body resembles a fine shoot of salt-petre; in others, it is shorter; and, in many, so short, that it is hardly seen; the top only of the pyramid is conspicuous. But, however they may differ in these particulars, they are each composed of a column, or stem of six sides, and terminated by a point shaped like a pyramid, and composed also of six sides.

Wherever there is a crack between the solid parts of the stone, or wherever there is a cavity in a lump of iron ore, these crystals are found. If the crevice be small, the crystals are also small; if large, the crystals are larger in proportion. But the largest and finest of all are found in the great cavities of a kind of reddish stone found plentifully here, and which is very rich in iron.

In these cracks or cavities they encrust the whole surface, and often continue growing till their tops meet in the center; so that the whole space is filled up, except the vacancies between the several shoots.

The manner in which these crystals grow is somewhat remarkable. The base is composed of a crust of coarse, whitish, and irregular crystal, spread over the whole surface of the crack or cavity; and, from the upper part of this crust, rise the other crystals, which are pure, fine, transparent, and of a regular figure. The last only are properly called Bristol-stones; for the crust or bed on which they grow, is not so much regarded; and these all consist of a sprig, terminated by a pyramid; and, as these sprigs or columns are larger or shorter, and as they are disposed more or less regularly, they make a different appearance. In general, the most beautiful pieces are found in cavities moderately large, where the crust is not too thick, the columns short and regular, and the crystals not too much clustered together.

Such are the general forms and manners in which the crystals, called Bristol-stones, are found; but the variety resulting from the form of the cracks, and the size of the cavities, render the change in their shape and appearance almost infinite.

We have already observed, that these crystals grow particularly in lumps of iron ore; and shall now add, that

that great plenty of it is found in almost every corner of this district. If the attempt of smelting iron from the ore with pit-coal, should ever be completed, there is the greatest reason to think, the neighbourhood of Bristol will be one of the most flourishing places in this kingdom; for there is plenty, both of ore and pit-coal, in these parts.

Nor is iron the only metal found here: the rocks contain also veins of lead-ore: they are, indeed, small; but, this is no reason why they should not be worked; for, very often, the largest and richest veins make only a slight and inconsiderable appearance when first discovered.

In our survey of these parts of the country, we often observed a very beautiful sort of rustic work in the stone facings of the gateways leading to gentlemen's houses. We could not help admiring the beauty of this rustic work, and forming comparisons between it and what we had seen elsewhere, not at all to the advantage of the latter.

The beauty of the rustic-work seen about London consists in the great variety and studied irregularity of the appearance; but this was infinitely excelled by what we now saw in the country. The raised parts of the latter are not only thrown into a variety of forms and combinations, not to be seen in the other; but, the surface of these raised parts is itself elegant beyond description. All the raised parts are of a rounded form; and their surfaces, though not smooth and even, have a general aspect of equality; they are curdled, or waved, as it were, in a variety of directions, equal to that of the disposition of the parts themselves; and fill the eye, without offending it, in a manner far superior to any thing we ever before saw.

When the beauty of these rustic pieces induced us to take a nearer view, our admiration was increased; it appeared, not like a piece of common rustic, but an imitation of something far more elegant. The depths of the hollows between the rising parts is varied in such an amazing manner, that no two of them are alike; and the waving and curdlings on the surface gives every part an appearance of a piece of rustic in miniature; the whole being formed, like that of the mass itself, into risings of the most elegant kind, with beautiful irregular hollows between them.

We were astonished to see so much work, labour, and art, employed in places where, from the very nature of the situation, few admirers of such works could be expected; but were soon undeceived: we found, that the hand of nature, without any assistance from art, except that of putting them together, had formed these beautiful pieces of rustic.

Near Cotham-house, at a small distance from Bristol, we found a large bed of stones, of which the above pieces of rustic were formed. This stone does not lie in a continued mass, but in separate lumps: many are about two feet and a half in length, and of a very irregular figure; but generally of a round or oval form, and their thickness about eight or nine inches.

But the external surface, however beautiful, is not comparable to the internal parts. The stone is so hard, that it will take a fine polish, and exhibit a landscape, like that formed by some masterly hand in painting. Rivers, mountains, grottos, and all other objects requisite to form a beautiful picture, are here delineated by the pencil of nature. In one part of a stone we particularly examined, (for they are not all alike, the same variety being found on the internal as on the external part) were minute specks of a dark colour, and irregular form, resembling clouds seen through some distant opening: in another part, the appearance of an open country; and in others, trees, bushes, shrubs, and hedges, interspersed with brooks and rivers.

The ground of the stone is a dusky brown, but not the same throughout, being fainter in some parts, and deeper in others. At the very bottom, there is generally a coat paler than all the rest; and, at the top, where the rustic risings are cut through, it is paler than any of the other parts of the stone, except the bottom. The rest is shaded with different degrees of brown; while some of the figures are blackish, and the palest of them darker than the rest of the stone.

It is found, that whatever part of the stone is cut in the same direction, the same figure will be exhibited; so that a great number of beautiful slabs may be cut out of each stone. The gentlemen in the neighbourhood are not entirely ignorant of its beauty: they frequently procure slabs to cut from it, which they polish, and place in frames, where they exhibit a most elegant appearance. We admire what is generally called Florentine slate, for its representing ruins, and figures of the same kind; but this is not comparable to the Cotham-stone: the latter is as much superior to the former, as marble is to free-stone.

At King's Weston, already mentioned in describing the Bristol stones, is the house of John-Edward Southill, Esq; built by Sir John Vanburgh. It is in his heavy stile; and the hall, the only tolerable room in the whole edifice, rendered wholly useless by a vast echo. Before one of the chimneys is a prodigious pair of elk's horns, dug out of a bog in Ireland; and a fine picture of lord Thomas Cromwell, by Holbein.

The lawn before the house is very beautiful; but the best view of it is from a hill a little beyond the breakfasting-house frequented by the company at the hot-well. To the left are beautiful woods, in the midst of which Mr. Southill's house appears. In the front of the edifice is a very fine valley, near two miles broad, beautifully intersected with hedges and trees, and bounded by the Severn, which is here ten miles in breadth. Here you have also a view of King-road, terminated by the mountains of Wales. On the other side, there is an extensive view of the country, beautifully interspersed with farms and villages. The windings of the Severn are seen for twenty miles, and those of the Avon quite to Bristol.

Having surveyed the part of the country lying near the hot-well, we returned to Bristol, and from thence pursued our journey towards Bath. In our way, we visited Mr. Champion's copper-works, situated about three miles from Bristol. Here the whole process of the copper and brass manufactures is exhibited, from the smelting of the ore, to the forming it into plates, wire, pans, vessels, pins, &c. After the ore is several times melted, it is poured into a flat mould of stone, by which means it is formed into thin plates about four feet long, and three broad. These plates are cut lengthways into seventeen stripes, and these again, by particular machines, into many more very narrow ones, and drawn out to the length of seventeen feet, which are again drawn into wires, and done up in bundles of forty shillings value each. About an hundred of these bundles of wire are made here every week, and each of these bundles makes an hundred thousand pins. The wires are cut into proper lengths, and the whole process completed here, employing a great number of girls, who, with little machines worked by their feet, point and head the pins with such expedition, that each of them will do a pound and a half in a day. The heads are spun by a woman, with a wheel resembling a common spinning-wheel; and then separated from one another by a man, with another little machine like a pair of shears.

It may not be improper to observe here, that copper is changed into brass, by being melted with a certain quantity of lapis calaminaris mixed with powdered charcoal. Seven pounds of the above mixture are put into a melting-pot, with five pounds of copper; and the whole changed by the fire into brass.

Great quantities of aukward pans and dishes are also cast here, for the use of the negroes on the coast of Africa. All the machines in these works are put in motion by means of water, which, after passing over the water-wheels, is again thrown back into the mill-pond by means of a prodigious fire-engine, which raises near three thousand hogheads every minute. This is reckoned one of the finest and best constructed engines in the world.

In our way from Bristol to Bath, we passed through Keynsham, or Caynsham, a small market-town, situated on the south bank of the river Avon, and on the west bank of a small river, called the Chew, which here falls into the Avon, one hundred and eleven miles from London. It is reckoned a very foggy place, but has a large capacious church, a charity-school, a stone bridge of fifteen

teen arches over the river Avon, and another stone-bridge over the Chew. A considerable trade is carried on here in malt, which is made in this town, and sent, by means of the Avon, to Bath and Bristol. Here was an abbey of black canons, founded by William earl of Gloucester, about the year 1170, and dedicated to the Virgin Mary, St. Peter and St. Paul. At the dissolution it was valued at four hundred and nineteen pounds, fourteen shillings and three-pence *per annum*. Edward VI. gave it to Thomas Bridges, Esq; in the year 1553, and it is still the seat of that ancient family.

Keynsham has a weekly market on Tuesday; and two annual fairs, held on the twenty-fourth of March, and the fifteenth of August, for the sale of cattle and cheese.

Near this town the river Avon is crowded, during the spring season, with millions of fish, called Elvers, a kind of small eel, about the size of the barrel of a goose-quill. These the people skim from the surface of the water with small nets; and, by a particular method, scour off their skins, and make them into small cakes for sale. These elver cakes, fried, and eaten with butter, are considered as dainties.

In the neighbourhood of Keynsham is a quarry, in which are found a number of fossils, in the shape of serpents, coiled up like a rope, but generally without any representation of a head. The credulous people were formerly persuaded, that they were real serpents, changed into stone by one Keina, a devout British virgin, and from whom also the town took its name.

About four miles to the southward of Keynsham, is a famous Druid monument, which we were desirous of seeing; and, in our way to it, passed through

Pensford, a small, but neat market-town, situated on the river Chew, one hundred and thirteen miles from London. It has a considerable manufacture of woollen cloth; a weekly market on Tuesday; and two annual fairs; the first held on the sixth of May, for cattle, sheep, and horses; and the second on the ninth of November, for sheep and horses.

Stanton-Drew is situated near the town of Pensford. It is an ancient monument, called the Wedding, from a ridiculous tradition among the people, that, as a bride was going to be married, she, and all her company, were changed into stones. It is undoubtedly a work of the ancient Druids, and seems to be a stupendous model of the Pythagorean system of the world, constructed with enormous blocks of marble taken out of Clay-hole, near Wells. Three circles, representing the sun, the earth and the moon; together with some stones representing the planets, Venus, Jupiter, and Saturn, are still remaining; and it seems highly probable, that the circles of the sun and moon were used as temples, in honour of those luminaries: the least of these temples is as big as Stone-henge.

On the top of a hill, near the above monument, is a large camp, called Stanton-bury. It is surrounded with double works, including an area of near thirty acres, and appears to have been thrown up by the Danes. From this camp there is a very extensive and beautiful prospect of the adjacent country, interspersed with woods, hills, valleys, streams of water, farms, villages, and gentlemen's seats: you may even perceive the Steep and Flat Holms, two small islands in the mouth of the Severn.

Bath was the next place we visited. This ancient and famous city is situated in a valley, surrounded with lofty hills, on the banks of the river Avon, one hundred and eight miles from London. It is the see of a bishop, united to that of Wells; and is governed, under a charter of queen Elizabeth, by a mayor, eight aldermen, and twenty-four common council-men.

The Romans had a station here, which they called Camulodunum, from a mountain on the south side of it, dedicated to Camulos, the British god of war. The walls of the city are almost entire, and supposed to have been built by the Romans, except the upper part, which seems to have been repaired with the ruins of Roman buildings. The area, inclosed by the walls, is but small, and of a pentagonal form. In these walls were four gates, and a postern; but these have been all lately pulled

down, and taken away. There was also, formerly, an additional wall and ditch, extended from the south-west angle to the river, by which the approach of an enemy was intercepted on two sides of the city, unless they crossed the river. The small compass of ground within the walls, and the great resort of people hither, for the benefit of the waters, induced the inhabitants to crowd up many of the streets to an unfightly and inconvenient narrowness: the houses are, however, handsomely built, & the additions lately made are very grand and magnificent.

In this city are five hot baths, called the King's Bath, the Queen's Bath, the Cross Bath, the Hot Bath, and the Leper's Bath.

The King's Bath is sixty feet square, supplied by several hot springs, which rise in the middle of it. The water of one of these springs is so hot, that they are obliged to turn the greater part of it away, for fear of over-heating the bath. It is accommodated with several slips, or dressing-places, some of which are appropriated to the men, and others to the women, both of whom bathe in linen drawers and shifts. The walls are full of niches, supposed to have been made by the Romans. There are twelve on the north side, eight on the east, and the same number on the west, and four large arches on the south; the whole being encompassed with a parapet or balustrade, with a walk round it. In the center of this bath is the statue of an ancient British king, called Blayden, the soothsayer; with an inscription, importing, that he discovered the use of these springs eight hundred and sixty-three years before the christian æra.

Contiguous to this bath is a neat pump-room, where the company meet to drink the water, which is conveyed to it from the springs, as hot as it can be drank, by means of a marble pump.

The Queen's Bath is contiguous to the King's Bath, being only separated by a wall. It has no springs, but receives its water from the King's Bath, and, consequently, is not so hot. It is not so large as the former, nor so much frequented.

The Cross Bath hath its name from a cross that formerly stood in the middle of it. It is of a triangular form, and its heat less than that of the King's. This bath, which is chiefly frequented by persons of quality, was covered by James Ley, earl of Marlborough. On one side is a gallery for spectators; and, on the opposite, a balcony for a band of music. In the center is a marble pillar, adorned with curious sculpture, and erected at the expense of the earl of Melfort, in compliment to king James II. and his queen, and in memory of their meeting here. The guides of this bath say, that, in hot weather, a large black fly is frequently seen here, and said to live under the water, and to come up from the springs. Under the gallery and balcony above-mentioned, are the slips, or ranges of small dressing-rooms, one for the gentlemen, and the other for the ladies.

The Hot Bath has its name from being formerly hotter than the rest, but it was then not so large as at present. The well in this bath supplies its own pump, and also that in the Cross Bath, being conveyed thither by pipes, and from which it is fifty-eight feet and a half distant.

The Leper's Bath, so called from its being appropriated to persons supposed to have a leprosy, or other disease of that kind, is filled by the overflowings of the Cross Bath.

These hot springs were fenced in by the Romans, with a wall, to separate them from the common cold springs, with which this place abounds; and there is a tradition, that they also made subterranean canals to carry off the cold waters, lest they should mix with the hot. As this city lies in a valley, surrounded with hills, the heat of these waters, and their milky, detergent quality, are ascribed to the admixture and fermentation of two different waters flowing from two of those hills; one called Carlton-down, and the other Lansdown. The water from Carlton-down is supposed to be sulphureous or bituminous, with a mixture of nitre; and the water from Lansdown to be tinged with iron-ore: and it is well known, that a mixture of sulphur and filings of iron, moistened with water, will produce any degree of heat.

It is remarkable, that these hot springs are always the same; for the longest and heaviest rains do not make them discharge more water, nor the driest seasons cause them to discharge less. It is therefore evident, that these waters are not diluted, and their mineral virtues weakened by rains; nor their virtues increased, and the water rendered stronger by drought.

In our enumeration of the uses of these waters, it cannot be expected that we should particularly mention the method proper to be taken by every person who would find benefit from these, or any other mineral springs; this can only be learned from the circumstances of the disorder, and a proper comparison between the strength of the patient and that of the disease.

Dr. Oliver observes, that "as warm water, they are allowed to soften and relax the fibres by external application, and to dissolve saline and gelatinous concretions, by being admitted into the habit of the body. But the saline, sulphureous, and saponaceous particles manifestly contained in the Bath waters, must render these more penetrating, and more powerful solvents than common water.

"The rarefaction of the fluids, caused by the warmth of the bath, is plainly a deobstruent, especially when the too rigid sides of the vessels are rendered soft and yielding by the distending force of the rarified humours. By this means, the diameters of the canals are enlarged, and the moleculeæ, which were to pass through them in their contracted state, will be pushed on with ease by the power of the general circulation, and, consequently, the obstructions, which were before formed by these moleculeæ, will be removed. In how many diseases will this single effect of warm bathing be beneficial! Probably this rarefaction of the fluids, and relaxation of the solids, conjointly, may operate in several series of the vessels, which no medicine is capable of entering, and, consequently, may remove obstructions in the first capillaries, which would, by degrees, have produced chronical distempers, the causes of which we could never have discovered; or, if discovered, been able to have obviated their effects." Thus, as bathing the whole body opens the pores of the skin, searches and cleanses the glandular system, promotes the distribution of the transfudatory lymph, enlivens the circulation, and thereby prevents the retention of acrimonious humour; so it must be of the greatest use in all chronical distempers in general, in stubborn, cutaneous foulnesses, and in cold phlegmatic obstructions.

Hence bathing is found to be of great service in most gouty cases; but great care must be taken, that the gouty matter be not too suddenly dissolved in large quantities by too long a stay in the bath, or too intense a degree of heat. If this be the case, the patient will soon find himself feverish, which is a certain sign that some of this matter is got into the blood, and that nature is labouring to free herself from it. He must therefore wait, and not bathe again till she has performed this necessary work, which will probably be thirty or forty hours, by a fetid sweat, or turbid urine.

It must also be carefully observed, that bathing is never proper during a fit of the gout, or at its near approach; for then nature is endeavouring to throw off her recrements in a natural way, and therefore must not be disturbed in her work. Accordingly we find, that if a person put his feet into Bath water, while the fit is upon him, it either enrages the gout, or strikes it in.

It is universally allowed, that the temperate seasons of the year are most proper for bathing and drinking the waters; and that previous evacuations are necessary to unload the habit, and clean the first passages. Dr. Oliver observes, that "too great a degree of heat in the bath, too long a stay in it, too hot a bed after bathing, a profuse sweat too long continued, being exposed to the air on bathing days, or eating or drinking too plentifully of high-seasoned meats, or inflaming liquors, during a course of bathing, are always improper, often dangerous, and sometimes fatal: that it is most prudent for the generality of bathers not to dip their heads at all, except when there are cutaneous

"ulcers, dry scabs and scurfs, head-achs, &c. in which cases, the head ought to be dipped when the bather is just going out of the water."

Upon the whole, it is evident, "That, by the prudent use of the hot baths, most chronic diseases may be relieved, and sometimes cured; while persons in full health may be greatly injured by sporting with so powerful an alterative."

As pumping is of great service in several disorders which affect the extreme parts, it may be proper to observe, that the same end was at first, in some degree, answered, by what was then called Bucketting, which was performed by taking up the water in buckets, and pouring it leisurely on the part affected; by which method, the warmth and virtues of the water were thought to penetrate deeper than by bathing only. This was usually performed in pains of the head, deafness, stupors, sciaticas, palsies, cold and withered limbs, &c. But, after pumps became common, this method of embrocation was laid aside, and pumps erected to supply its place; by which means the water is drawn more immediately from the spring, is hotter, its virtues more concentrated, and it falls with equal, if not greater force, upon the part affected; and, consequently, penetrates deeper, and is attended with more success. Pumps were at first used only in the baths; but, it being found, that women subject to hysterics, patients afflicted with gravel in the kidneys, and persons extremely weak, were incapable of bearing both the heat of the bath, and pumping at the same time, an expedient was found, by raising the water somewhat higher, to pump the extreme parts, without going into the bath at all; and this they call Dry-pumping.

Dr. Randolph remarks, that the virtues of Bath-waters, applied by pumping upon any particular part, will, in some measure, appear, from the two following observations. 1. "That it is of singular service in old pains and aches, where there is an occlusion of the pores, and a fixation of cold phlegmatic humours. 2. That sprains and relaxations of the membranous or tendinous parts are cured by it. From the first we conclude, that it is a powerful discutient; from the second, that it is a great strengthener." Therefore, though there is no great danger, in all gouty cases, in pumping the part during the fit; yet it may be of great service upon its decline, as it prevents the fixing and concretion of gouty matter, and, at the same time, strengthens the part. For the same reason, it is also of service to those whose sinews are impaired and crippled by severe fits and frequent returns.

Bath water, taken inwardly, is a warm stomachic, which adds vigour to the blood, without heating it too much; and, if given in a proper quantity, will sit easy on the stomach, strengthen it effectually, and enable the concoctive powers to assist in the discharge of any offending matter. It not only helps digestion, but also defends the vital parts from any attack that might be made upon them. "It prevents" says Dr. Randolph, "the generation and retention of acrimonious impurities, as it supplies the body with aqueous moisture, and so answers the purpose of a diluter; and this it does more effectually than any other water, because it does not chill the blood, as that is apt to do, and so check the exhalation of the transfudatory lymph, and is, withal, so active and permeable, as to reach the remotest parts," by which means its good effects extend even to the minutest secretions. Hence, in scorbutic habits, which indicate the approach of the gout, the Bath water is the most likely preservative, as it is also the best remedy to prevent the return of that distemper, where persons have already been afflicted with it. In the gout in the stomach and bowels, and other disorders of the intestines, it is a medicine which operates directly upon the part affected, by its healing virtue, and by enabling nature to throw off the offending matter from the internal to the external parts. Its balsamic virtue also renders it of use in inward ulcers, erosions, and excoriations. But it may be necessary here to distinguish from which spring, and what quantities of the water each patient ought to drink. Such as have cold lax bowels, are subject to loosenesses

and flatulencies, gouty cholics, morning reachings, and want of appetite, Dr. Oliver recommends drinking the waters of the King's Bath; beginning with a small quantity, either in bed, soon after they rise, or about an hour after breakfast, as it agrees best with the stomach, increasing the quantity according to the effects produced. But as the waters of this spring, when drank in small quantities, are apt to produce costiveness, this must be removed, either by increasing the quantity, or changing the water for that of the Hot Bath; and, if this does not prove sufficiently opening, small doses of tincture of Senna must be occasionally repeated.

When a sick person is subject to costiveness, is easily heated, and inclined to be feverish, he should be gently purged with cooler, softer, and milder cathartics, joined with soap; then drink the waters of the Hot Bath, and if they prove too heating, recourse must be had to those of the Cross Bath, which are much cooler and more opening than the former, and may be safely drank, when those from either of the other springs would be hurtful.

As the lungs, in some gouty persons, are so very tender, and easily inflamed, that there would be some danger in drinking either of the waters immediately from the pump, they ought to be brought to the patient's lodgings, and suffered to stand about six minutes, that their volatile and heating particles may have time to fly off; and then, by putting a spoonful of new milk into each glass, they will become still safer, and more beneficial, especially the waters of the Cross Bath.

The waters of all the baths have a strong smell, are of a blueish colour, and emit a thin vapour. After long standing, they deposit a black mud, which is used, by way of cataplasms, for local pains, and often proves of more service than the waters themselves. This mud they also deposit on distillation.

The seasons for drinking the Bath-waters are the spring and autumn. The spring season begins with April, and ends with June. The autumn season begins with September, and lasts till December; and some patients remain here all the winter. In the spring, this city is mostly frequented for health, and, in the autumn, for pleasure, when at least two thirds of the company come to partake of the amusements of the place. In some seasons, there have been no less than eight thousand people at Bath, besides the inhabitants. An officer is appointed by the mayor, to superintend the baths, and to keep order among the bathers, and their guides.

There are in this city a cathedral, and three parish-churches. The cathedral, or abbey-church, is a venerable pile, in the Gothic taste, and has several superb monuments. It is dedicated to St. Peter; and was begun, in the year 1137, by Dr. Oliver King, but not finished till 1612. The structure is small, but beautiful; and the inside of the roof neatly wrought. In the middle is a handsome tower, with a ring of eight bells; and the east window is very magnificent. On the principal front, which faces the west, are the figures of saints and angels, ascending and descending, in memory of a dream, by which Dr. Oliver King was induced to build this church. Before it is a handsome square area, but, of late years, greatly deformed with houses. This church stands upon the spot where there was formerly a Roman temple, dedicated to Minerva, patroness of the baths. Two Roman inscriptions are placed on the eastern wall of the church, but greatly defaced. The parish-churches are, St. James's, St. Mary's, and St. Michael's, each of which has a ring of bells, but there is nothing remarkable in the building.

On the south side of the cathedral stood the abbey, some parts of which are still remaining; but has, long since, been converted into lodgings, and honoured with the residence of king James II. queen Mary, consort to king William III. queen Anne, and her royal consort, George prince of Denmark. It has lately been greatly enlarged with private baths of different kinds, the hot-baths being filled with water, by means of pipes laid to the King's Bath.

The market-place is spacious and open, and supplied with the best of meat, fish, vegetables, fruits, &c. Over the market-house is the town-hall, a spacious room, sup-

ported by twenty-one stone pillars. At the upper end of it are the pictures of the late prince Frederick, and his consort the princess of Wales, being their present to the corporation, to whom they had before given a silver cup and waiter, gilt. Round the hall hang the pictures of the members of the corporation, drawn at the expence of the late general Wade, one of their representatives in parliament, whose picture is placed over the entrance. And, at the south end, are two very fine pictures of Mr. Pitt, now lord Chatham, and the late Mr. Allen. Here are also the pictures of the British king Coel, who is said to have given the city its first charter; and of Edgar, one of the Saxon kings, who was crowned here.

There are in this city a free-school, and two charity-schools; one for fifty boys, and the other for fifty girls, who are clothed and taught. Here is an hospital, dedicated to St. John, and founded by Fitz-Joceline, bishop of this see, in the twelfth century, for poor sick people who come hither for the benefit of the waters, with a handsome chapel of white free-stone. Here is also an alms-house, called Ruscot's Charity, and endowed, for the maintenance of twelve men and twelve women. Besides which, there are other alms-houses, chiefly supported by the chamber of the city. But what more peculiarly deserves attention, is the General Hospital, the first stone of which was laid in 1738. It is a very commodious building, one hundred feet in front, and ninety in depth, and will accommodate one hundred and fifty patients. It is intended for the reception of the sick and lame from all parts of the kingdom, and is supported by the generous subscriptions and contributions of persons resorting to this city.

We have already observed, that the additional buildings lately erected in this city are very grand and magnificent. These are principally found in Chandos-buildings, Queen-square, the North and South Parades, King's-mead-square, Galloway-buildings, and the King's Circus.

The Grove, near the Abbey-church, now called Orange-square, in compliment to the late prince of Orange, has several new-built houses; and, in the center, is erected a monumental stone, with an inscription in honour of the prince of Orange, who visited Bath just before his marriage with the princess royal of England, and received great benefit from the waters. This stone was erected by the late famous Mr. Nash, who may be called the founder of Modern Bath. On the stone is the following inscription:

*In Memoriam
Sanitatis
Principi Auriaco,
Aquarum Thermalium Potu,
Favente Deo,
Ovante Britannia,
Feliciter Restitutæ.
M.DCC.XXXV.*

“ In Memory of the happy Restoration of the Health
“ of the prince of Orange, by drinking the Bath Waters,
“ through the Favour of God, and to the extreme Joy
“ of Britain. 1735.”

The North and South Parades, situated near Orange-square, are grand and noble, each being two hundred and ten feet in length, and fifty in breadth. These two terraces, as well as the houses, are founded upon arches, from twenty-four to forty feet high. The area, which the grand terrace surrounds, is called the Roman Forum, because Agricola, the Roman general in Britain, built a forum on the same spot of ground, in the reign of Titus Vespasian; and from that work, the country round the hot-springs, in succeeding times, obtained the name of “the Hundred of Bath Forum.” The houses that inclose this area, are of one uniform structure, and crowned with a balustrade.

On the south side of the city, on the banks of the river, is a most elegant square. The principal side of this square, according to the original plan, was to have the appearance of but one house, though it was to have been divided into several. It is five hundred feet long, and the two wings are two hundred and sixty feet each.

In each front are sixty-three windows, and thirteen in each wing. This building, from the neighbouring hills, appears like one grand palace. It was at first intended to have been adorned with above three hundred columns and pilasters of the Corinthian order. Upon the corner of every side, there was to have been a tower; and in every front, a center-house and pediment; but, in executing the plan, it was judged proper to lay aside the ornaments. In this square is a superb ball-room, in the form of an Egyptian hall, ninety feet long, and fifty broad; and an assembly-room of the same dimensions, with a bowling-green and garden. On the south side of this square is a bridge over the Avon, consisting of one arch, one hundred and twenty feet wide.

Queen's-square is situated without the walls, on the north-west side of the city. It is a very elegant square, with a fine chapel, and the area handsomely laid out, and inclosed with rails.

In the center is a lofty obelisk, seventy feet high from the pedestal, and terminated in a point. About six feet above the pedestal, is the following inscription:

In Memory
Of Honour bestow'd,
And in Gratitude
For Benefits conferr'd
In this City,
By his Royal Highness
Frederick
Prince of Wales,
And his Royal Consort,
In the Year M.DCC.XXXVIII.
This Obelisk is erected,
By Richard Nash, Esq;

To the north of Queen's-square is the King's Circus, one of the most elegant piles of building in Europe. It is of a circular form, and the houses of one uniform structure and size. The fronts are enriched with columns of three different orders; the ground-floor with the Doric; the first floor with the Ionic; and the second with the Corinthian. Many of the nobility and gentry have houses in the Circus, which form one of the most beautiful appearances that can be imagined.

A little to the west of the Circus, another elegant pile of buildings is now begun, and is to be called the Crescent, from its form. In a word, the new buildings already finished, and now building, are amazing, and will render Bath one of the most elegant cities in England. And, in order that nothing may be wanting to complete the circle of pleasures in this city, two large and elegant theatres are lately erected, with magnificent scenery and decorations.

The stone with which these fine buildings are erected, is dug out of quarries upon Charlton-down, and was, during Mr. Allen's lifetime, brought from thence, down a steep hill, on four-wheel carriages of a particular form and structure. The wheels were of cast iron, broad and low, with a groove in the perimeter, to keep them on pieces of wood fixed in the road, on which they moved down the hill, without the help of horses, though loaded with four or five tons weight of stone. The motion was regulated by means of a friction lever, bearing more or less on the hinder wheels, as occasion required. But, since the death of Mr. Allen, these carriages are laid aside, the artificial road used only as a private one for common wheel-carriages, to the house and adjacent hill; and the stone sent to Bath, in four-wheeled waggons, by the public road, over the Avon.

The stone, when first taken out of these quarries, is not so white and hard as that of Portland; but, after being exposed, for a considerable time, to the air, it becomes sufficiently hard to answer all the purposes of building. This softness gives it a very particular advantage, as it is easily wrought with edge-tools, and fashioned, in a lathe, for all the ornamental parts of architecture, statuary, &c. for which purpose there are shops and artificers constantly employed.

Near the summit of Charlton-hill, where the stone just mentioned is dug, stands the seat of the late Ralph

Allen, Esq. It is called Prior-park, and commands a prospect as delightful as it is possible for the imagination to conceive; the city of Bath being the principal object, and towards which the principal front of the structure is turned. The seat consists of a house in the center, two pavilions, and two wings of offices, all united by arcades, and forming a continued curve of building, about one thousand feet long in front, of which the house itself takes up about one hundred and fifty feet. It is of the Corinthian order, elevated on a rustic basement, and crowned with a balustrade; the center advancing forward, and making one of the largest and most correct hexastyle porticoes in the kingdom. The order includes two stories, and the house has fifteen windows in length. The portico, together with a Corinthian hall in the principal story, a chapel, on the same floor, of the Ionic order, supporting the Corinthian, and a Corinthian gallery extending over the hall, and the rooms on each side of it all finished with free-stone, compose the beauties and curiosities of the whole pile; which, from the north terrace of the Royal Forum in Bath, appears with very great advantage, from its beautiful and lofty situation on the side of the mountain.

The gardens to this seat consist of two terraces, and two slopes, lying before the north front of the house, with serpentine walks made through a little coppice, opening to the westward of these slopes; but these are adorned with vases, and other ornaments in stone-work; and the affluence of water is so great, that it is received at different places, after many little agreeable falls, at the head of one of which is a statue of Moses, in an attitude of admiration, which, it is natural to suppose, must have seized the mind of that great legislator, on his beholding the waters gushing from the rock, after his striking it with his rod. The winding walks were made with great labour; and, though no broader than for two or three to walk a-breast, yet, in some places, they appear with little cliffs on one side, and with small precipices on the other. These particulars may be considered as beauties; but the rides made through the adjoining lands, exhibit, in greater abundance, the real beauties of nature; and the terrace formed above the house, near the summit of the hill, may be placed in competition with the greatest work ever made in England to adorn a seat. On this terrace is a statue of the late marshal Wade.

Perhaps the reader will not be displeas'd with seeing the following lines, which we have borrowed from Mrs. Chandler's description of Bath, as they relate to the gardens of this seat, and are inscribed to Mr. Allen.

Thy taste refin'd appears in yonder wood,
Not nature tortur'd, but by art improv'd;
Where cover'd walks with open vistas meet,
An area here, and there an open seat.
A thousand sweets in mingled odour flow
From blooming flow'rs, which on the borders grow:
In numerous streams the murm'ring waters thrill,
Uniting all, obedient to thy will,
'Till by thy art in one canal combin'd,
'They thro' the wood in various mazes wind;
From thence the foaming waves fall rapid down,
In bold cascades, and lash the rugged stone.
But, here their fury lost, the calmer scene
Delights the softer muse, and soul serene:
An ample basin, center of the place,
In lymph transparent, holds the scaly race;
Its glassy face from ev'ry ruffle free,
Reflects the image of each neighbouring tree;
On which the feather'd choir's melodious throng,
By love inspir'd, unite in tuneful song;
Their tuneful song the echoing woods resound,
And falling waters add a solemn sound:
Sure this the Muses haunt: 'tis hallow'd ground.

About the year 676, king Ofric built a nunnery in Bath, but the structure was, some time after, destroyed by the Danes. The church of the nunnery, dedicated to St. Peter, was, however, afterwards rebuilt, about the year 775, by king Offa, who placed secular canons in it; but king Edgar removed them, and, about the

year 970, placed an abbot and convent of Benedictine monks in their room; and these continued here till the dissolution, when the revenues of the monastery were valued at six hundred and seventeen pounds, two shillings and three-pence.

Bath being environed with hills, and a river winding between them through the middle of a rich valley, the meadows on each side the stream afford many pleasant walks; and, if you mount the hills on horseback, the country affords the most delightful rides that can possibly be conceived.

The access to the hills grows every day better, by the prudence and good management of the commissioners of the turnpike roads; so that, though few people cared formerly to keep coaches at Bath, yet the use of carriages has greatly increased of late years. Before the first turnpike act was obtained, the direct road to Lansdown was so steep, that queen Anne was extremely terrified in going up: her coachman stopping to give his horses breath, and the coach wanting a drag-staff, it ran back, in spite of all the coachman's skill; nor could he, for some time, bring his horses to pull together, till some of the servants, by putting their shoulders to the wheels, stopped them by main force.

The weekly markets at Bath are held on Wednesdays and Saturdays: besides which, there are two annual fairs, held on the third of February, and the twenty-ninth of June, for the sale of cattle.

Near the top of Lansdown, already mentioned, is a spring of excellent water, which is conveyed, in pipes, to most parts of the city. The view from this hill is enchanting, and is equalled by few in this country which abounds in beautiful prospects.

On the brow of this hill is a monument, erected, by order of the late lord Lansdown, to the honour of Sir Bevil Granville, his lordship's ancestor, who was killed here on the fifth of July 1643, in a battle between him and Sir William Waller. The monument is erected as near as possible to the spot where that brave gentleman was killed; and, on the north side of it, is the following inscription:

Conquest or death was all his thought, so fire
Either o'ercomes, or does itself expire.
His courage work'd like flames, cast heat about,
Here, there, on this, on that side, none gave out,
Nor any pike in that renowned stand
But took new force from his aspiring hand;
Soldier encourag'd foldier, man urg'd man,
And he urg'd all, so much example can;
Hurt upon hurt, wound upon wound did call,
He was the mark, the butt, the aim of all;
His soul this while retir'd from cell to cell,
At last flew up from all, and then he fell.
But the devoted stand enrag'd the more
From that his fate, ply'd hotter than before,
And proud to fall with him, sworn not to yield,
Each sought an honour'd grave, and won the field:
Thus he being fall'n, his actions fought anew,
And the dead conquer'd, whilst the living flew.
Thus slain thy valiant ancestor did lie,
When his one bark a navy did defy,
When now encompass'd round the victor stood,
And bath'd his pinnace in his conquering blood,
'Till all the purple current dry'd and spent,
He fell, and made the waves his monument.
Where shall the next fam'd Granville's ashes stand?
Thy grandfire fills the sea, and thou the land.

About a mile to the west of the city of Bath is a quarry of hard stone, mostly used to mend the roads, but remarkable for many sorts of curious fossil substances which are constantly found here, particularly several sorts of shells, some of which are very black and glossy, and very evidently grow here, the whole rock being a gradual petrification of the earth in that part, as is sufficiently evident from several pieces of wood, and other matter, being found at the depth of sixteen feet and more below the surface of the solid rock.

Leaving the famous city of Bath, we pursued our jour-

ney, near the banks of the Frome, to Philip's Norton; and, in our way, passed through the village of Henton, where there was formerly a monastery of Carthusian monks, removed hither from Hetborn, in Gloucestershire, by Ela, countess of Salisbury, relict to William Langespe, who began a monastery for them, in her park here, in the year 1227, and finished it in 1232. It was dedicated to the Virgin Mary, St. John the Baptist, and All Saints; and was rated, on the suppression of religious houses, at two hundred and forty-eight pounds, nineteen shillings and two-pence *per annum*.

Near the lane leading to this place from Bath, there was a battle between the forces of king James II. and those of the duke of Monmouth, in which the latter had the advantage; and, had they pursued it, would have gained a complete victory. An old elm, standing a few miles distant from the above field of battle, afforded a sad testimony of the event of the duke's enterprize, for it was almost covered with the heads and limbs of the unfortunate persons engaged in the duke's cause, who suffered by the sentence of the cruel and infamous Jesters.

Philip's-Norton is a small market-town, about four miles from Bath, and one hundred and four from London. It has a very good market on Thursday, and three annual fairs, viz. the twenty-first of March, for cattle and cloth; the twenty-seventh of March, for cloth; the first of May, for cloth, &c. and the twenty-ninth of August, for cattle and cloth. The fair on the first of May is reckoned to be as great, for a wholesale trade, as most one day fairs in England.

Frome-Selwood is a large market-town, situated on the river Frome, in that part of the county which was formerly called Selwoodshire, nine miles from Bath, and ninety-nine from London.

It was formerly governed by a bailiff, and now by two constables, chosen annually at the court-leet of the lord of the manor. It is larger than many cities, but the streets are very irregular. There is only one church, a spacious one indeed, with a ring of six tuneable bells, and a fine organ; but there are six or seven meeting-houses for protestant dissenters, two of which are built of free stone, and as large and handsome, perhaps, as any edifice of that kind in England. Not far from the church is a free school; and, at some distance, an almshouse, or rather work-house, with a chapel belonging to it. Here is also a fine stone bridge over the Frome, which rises in the adjacent forest, and falls into the Avon about two miles to the eastward of Bath.

The number of inhabitants are computed at thirteen thousand, who carry on a very large manufacture of broad cloth. About the beginning of the present century, seven waggons used to go from hence every week to London, each of which carried one hundred and forty pieces of cloth to Blackwell-hall; every piece of which being valued at fourteen pounds, one with another, made the whole amount to seven hundred thousand pounds a year. Between forty and fifty years ago, more wire-cards, for carding of wool for the spinners, were made here, than in all England besides. Here were then no less than twenty master card-makers, one of whom employed four hundred persons, men, women, and children, in that manufacture, at one time; and every child between six and seven years of age could earn half a crown a week. The cloths chiefly manufactured here, are medleys, of seven or eight shillings a yard. This town has been long famous for its fine beer, which they keep to a great age, and is generally preferred by the gentry in the neighbourhood to the wines of France and Portugal.

A monastery was founded here by St. Aldhelm, dedicated to the Virgin Mary, before the year 705; but is supposed to have been destroyed by the Danes, as we find no mention of it after that period.

Here are two weekly markets, held on Wednesday and Saturday, and four annual fairs, viz. the twenty-fourth of February, and the twenty-second of July, for cattle and cheese; the twenty-fourth of September for cheese, and the twenty-fifth of November for cattle and cheese.

About two miles to the north-east of this town, lies the village of Brackley, where there was formerly an hermitage

hermitage, or small priory, founded by William, the son of Jeffery, some time before the year 1211. It was dedicated to St. Stephen, and inhabited by monks of the order of St. Augustine. At the dissolution of religious houses, it was valued at six pounds, five shillings and two-pence *per annum*.

In our road from Frome to Bruton, we passed by Charter-house, situated in the forest of Selwood, where there was formerly a nunnery; and, on the Carthusian monks coming into England, in the year 1181, a house of that order was erected here, being the first in this kingdom. It was built and endowed by Henry II. and dedicated to the Virgin Mary, St. John the Baptist, and All-saints. It continued till the dissolution, when its revenues amounted to two hundred and fifteen pounds, fifteen shillings *per annum*.

Bruton is a well-built, populous market-town, situated on the banks of the river Bru, or Bry, one hundred and fifteen miles from London. It has a large handsome church, a good free school, founded by Edward VI. and a stately alms-house, consisting of the ruins of a priory. Here is a fine stone-bridge over the river Bru; and the town carries on a good trade in ferges, stockings, malt, and other commodities. Over the market-house is a spacious hall, where the quarter-sessions are sometimes held for the eastern division of the county.

About the year 1005, Ailmer, earl of Cornwall, built a religious house here for monks, who were changed into black canons by William Mohun, earl of Somerset, in the reign of king Stephen. This priory, in the beginning of the reign of Henry VIII. was converted into an abbey by the interest of William Gilbert the prior. It was dedicated to the Virgin Mary, and endowed, at the dissolution, with revenues, to the amount of four hundred and thirty-nine pounds, six shillings and eight-pence *per annum*. Of this structure there are still some remains, which are now converted into an alms-house.

This town has a weekly market on Saturday; and two annual fairs for the sale of cattle; the first held on the fourth of May, and the second on the nineteenth of September.

At Alford, situated on the banks of the river Bru, about two miles from Bruton, is a mineral spring of a purging nature, no ways inferior to those of Epsom in Surry. It is sent to many places at a considerable distance, and very much esteemed.

At Stavordale, or Staffordel, near Bruton, there was formerly a small priory of canons of the order of St. Augustine, said to have been built by Sir William Zouch. It was dedicated to St. James, and annexed, in the twenty-fourth year of the reign of Henry VIII. to the priory of Taunton.

Castle Carey was the next place we visited. It is one hundred and twenty-five miles distant from London, and has its name from a castle, at first belonging to a family of the name of Carey. This castle was afterwards fortified, and defended by William Lovel, its owner, for the empress Maud, against king Stephen.

Here is a market on Tuesday; and three annual fairs, held on the Tuesday after Mid-Lent Sunday, the first of May, and Whitsun Tuesday, for the sale of bullocks and sheep.

About five miles south-east of Castle-Carey, stands Wincaunton. It is a considerable market-town, and situated near one of the sources of the river Stour, one hundred and twelve miles from London. The greater part of this town was destroyed by fire in the month of April 1747. Here is a pretty considerable manufacture; and a very good market for corn, cheese, and cattle, on Wednesday; and an annual fair on Easter Tuesday.

Yeovil, which we next visited, is a very large market-town, situated on the banks of the river Ivel, one hundred and twenty-three miles from London. It is governed by a portreve, and twelve burgeses, who hold a court of record every three weeks, and have lands out upon leases.

The town is large, tho' the streets are narrow, and the houses, in general, mean; but the church is spacious, and has a ring of six deep bells. Here is also a charity-school for thirty boys, who are both taught and

cloathed. The great road to Cornwall runs through this town, which is furnished with several good inns.

Here is a considerable manufacture of cloth; but that of gloves is the principal. Here are many rich tradesmen; and so considerable a market, on Friday, for corn, cheese, hemp, flax, linen, sail-cloth, and other commodities, that it is thought to return as much money as any market in the county.

Here are also two annual fairs; the first held on the twenty-eighth of June, for horses, bullocks, sheep, lambs, hogs, and wool; and the second on the seventeenth of November, for horses, bullocks, sheep, and lambs.

Remarks on the SEA COASTS of Somersetshire.

The sea-coasts of Somersetshire are confined in a very narrow compass, extending only from the mouth of the Avon to about five miles beyond Porlock, not above fifty miles in length. The coast is very uneven, but generally low land, and very few ships come to an anchor on this coast, except such as are bound up some of the rivers or small creeks.

Near the middle of the channel, and about fifteen miles below the mouth of the Avon, is a small island, called the Flat-holmes. It is about two miles in length, and one in breadth, having a light-house erected near its southern extremity, for the safety of ships coming up the Severn.

About four or five miles to the southward of the above island, is another, called the Steep-holmes, from its being much higher land than the former. It is about a mile in length, and three quarters of a mile in breadth. Neither are inhabited, except by the persons who take care of the light-house on the former.

On the rocks of this coast, especially between Dunster and Watchet, great quantities of the Lichen Marinus, or sea-liverwort, generally called Laver, are found. The neighbouring inhabitants gather this herb when the tide is out; and, after cleansing and pickling it, send it to most of the large towns in the county, particularly to Bridgewater, Bath, and Bristol, and even some to London. It is of a pleasant taste, very nourishing, and a good antiscorbutic.

The water rises, on this coast, from thirty to thirty-six feet, on spring-tides, and runs in a very rapid manner; and, in neap-tides, from eighteen to twenty-two.

Of the INHABITANTS of Somersetshire.

The inhabitants of this county, especially in the inland parts, are plain, honest, and hospitable, but unpolished, and reserved in conversation. They entertain a kind of indifference for the rest of the world, owing, probably, to the good opinion they entertain of their own portion of it. In the large towns, where their manners are polished by conversation and intercourse with strangers, they are polite, easy, and affable; addicted to commerce and trade; and rarely omit any opportunity that offers of enriching themselves.

Curious PLANTS found in Somersetshire.

Madder, *Rubia*, found plentifully among the rocks about Bristol. It is remarkable, that the Dutch, after the hard frost in the year 1739-40, when all the madder in the low countries was destroyed, came hither, and collected the roots of this useful herb, and planted them in their own fields, from whence the greater part of our manufactures are now supplied.

Sweet-cane, *Calamus Aromaticus*, found in many of the watery parts of this county.

Maiden-hair, *Adiantum*, found in several parts of the county, particularly among the rocks near the hot well.

Monks Rhubarb, *Rumex*, found in the fields near Yeovil.

Birds-foot, *Ornithopus*, found plentifully on most of the dry commons and heaths of this county.

Bugloss, *Anchusa*, found on the sides of the hills near Bath.

Viper's Bugloss, *Echium*, found on the sides of chalky downs in several parts of this county.

Teazle, *Dipsacus*, cultivated, in great quantities, near Axbridge and Winton.

Broad-leaved Plantain, *Plantago*, found in many of the pasture-grounds of this county, particularly about Somerton.

Crow-foot, *Ranunculus*, found in many of the meadows and pasture-grounds.

Ash-coloured ground Liverwort, *Lichen terrestris cinereus*, Ray, found on most of the commons and heaths in this county.

Common broad-leaved Liverwort, *Lichen petraeus latifolius*, sive *hepatica fontana*, C. B. found on the sides of wells, and in moist shady places, not only on the ground, but also on stones, bricks, and wood.

The greater Burnet, or Burnet with oval spikes, *Sanguisorba spicis ovatis*, Hort. Cliff. found in moist meadows and pasture-grounds about Somerton and Glastonbury.

The greater and lesser Burnet Saxifrage, *Pimpinella foliis pinnatis*, &c.

The first is found in chalky woods, and on the banks of rivers, in many parts of this county, especially in the neighbourhood of Yeovil; and the second in dry and upland pastures.

Spoon-wort, or scurvy-grass, *Cochlearia*. Two sorts of this plant, called the common or round-leaved Scurvy-grass, and the sea scurvy-grass, are found in this county; the former on most parts of the sea-shore, and the latter

in salt marshes. We found plenty of it in the marshes near the mouth of the Parret.

Flowering Rush, *Butomus*, found in standing waters in many parts of this county.

Soapwort, *Saponaria*, found plentifully in various parts of Somersetshire.

Sea-lavender, *Limonium*, found, in great quantities, in places overflowed by the sea.

Sea-wormwood, *Absinthium*, found in plenty on the salt marshes near the mouth of the Parret.

Antique COINS, &c. found in Somersetshire.

Not many years since, an urn was dug up at Wincaunton, full of Roman coins; another urn, full of the same money, was discovered at Wevelscomb; and half a peck of the same coin was found on making inclosures round fields near Beacon-ash, a little above Sutton. At Liddiard Lawrence, situated between Bishops Liddiard and Stokegomer, a pitcher full of Roman medals, weighing sixty pounds, was dug up in the year 1666. On digging a hole for a gate-post, near Bruton, a piece of lead, one foot nine inches long, three inches and a half broad, and three inches thick, weighing fifty pounds, was discovered.

Somersetshire lies in the diocese of Bath and Wells, and in the province of Canterbury; and sends eighteen members to parliament, two knights of the shire for the county, two citizens for each of the cities of Bristol, Bath, and Wells; and two burgesses for each of the five following boroughs, Bridgewater, Ilchester, Milbournport, Minehead, and Taunton.

D O R S E T S H I R E.

DORSETSHIRE, or the county of Dorset, is bounded on the north by Wiltshire and Somersetshire; on the west, by Devonshire and Somersetshire; on the east, by Hampshire; and on the south, by the English channel. It is about fifty miles in length, from east to west, on the sea-coast, but not above forty in the inland parts; about forty in breadth, one hundred and fifty in circumference; and, according to Mr. Templeman's survey, contains nine hundred and fifty-nine square miles. In this county are thirty-four hundreds, twenty-two market-towns, two hundred and thirty-six parishes, six castles, about seven hundred and seventy-two thousand acres, twenty-five thousand houses, and one hundred and thirty-two thousand inhabitants. It is divided into five deanaries, viz.

Deanaries of Bridport, containing	48 parishes.
Dorchester	45
Whitchurch	55
Pimpern	32
Shafton	56

The archdeacon of Dorset has the jurisdiction of the whole diocese of Bristol, in which this county is entirely included. Dorchester, which lies near the middle of it, is one hundred and twenty-three miles south-west from London.

R I V E R S.

The principal rivers are, the Stour, the Frome, the Piddle, the Lyddon, the Dulish, and the Allen.

The Stour rises from three sources, in Somersetshire; the first near Wincaunton, the second near Pen, and the third near More-park. The second and third of these streams unite, soon after their entering Dorsetshire, in Gillingham forest, where the Stour becomes a considerable river, and directs its course nearly towards the south, to Fifehead, near which it is joined by the stream from Wincaunton. About two miles and a half below the above junction, it receives the waters of the Lyddon; and about half a mile farther, is joined by the Dulish, flowing, with a full stream, under the bridge at Sturminster Newton. Here it makes a serpentine bend, and directs its course to the south-east, washing the town of Blandford, and receiving, at Wimbourn-minster, the waters of the Allen. About four miles below its junction with the Allen, it leaves Dorsetshire, and falls into the English channel at Christchurch, a borough-town of Hampshire.

The Frome rises from several springs in the western parts of Dorsetshire; the principal of which is near Evershot, and directs its course almost due west, passes under Framton bridge, washes the town of Dorchester, and falls into a bay of the English channel, called Pool-haven, near Wareham.

The Piddle rises at the foot of a large ridge of hills near Alton, directing its course almost due south about five miles, when it makes a serpentine bend, and flows to the eastward, to a small village called Hyde, a little above which it receives a considerable brook, rising near Middleton. From thence it continues its course about six miles farther, and falls into Pool-haven, near the mouth of the Frome.

The Lyddon rises on the western side of a ridge of hills in Buckland hundred, and continues running, in a northern direction, about five miles, to Bagborough, where it is joined by a considerable brook, and falls into the Stour a little above Sturminster Newton, as we have already mentioned.

The Dulish rises near Iberton, and after flowing about four miles, in a northern direction, falls into the Stour at Sturminster Newton.

The Allen rises near a village called St. Andrew-Glisset, in the northern parts of Dorsetshire; and after flowing about ten miles through the country, in a southern direction, falls into the Stour near Wimbourn-minster.

All these rivers afford plenty of fish, but the tench and eels of the Stour are particularly excellent.

Remarks on the INLAND NAVIGATION of Dorsetshire:

The first bay of the sea, where ships may ride in safety, is called Pool-haven. The entrance is but narrow, and near the middle of it lies an isle, called Branksey Island, on which there is a castle. A bar or bank of sand, having only ten or eleven feet water on it at low water, stretches itself across the mouth of the harbour. The tide rises about six feet perpendicular, but flows twice in twelve hours, occasioned by the ebb coming out of the channel between the Isle of Wight and the main land. When ships are within the bar, there is room sufficient for them to come to an anchor. The shores on both sides are steep, though the channel is but narrow; and booms are placed all along the east side of it, for marks to direct the pilot in sailing up or down the channel. Small vessels go up to Wareham; but the larger stop in the bay, where there is very good anchor-ground; and safe riding.

Swanage Bay, a little to the northward of the highland of St. Albans, called Peveral Point, is a good road in westerly and southerly winds. But the small river which falls into the bay near Swanage, is not navigable, but with the tide, for small craft.

The mouth of the Wey, on which the town of Weymouth stands, is only navigable with the tide, the vessels at the quay lying a-ground at low water, so that ships of large burden cannot enter the haven. On the south side is a mould, or pier of stone, strongly built, and of the utmost service to the harbour, which would otherwise be soon rendered of no use to navigation.

The mouth of the river, on which Bridport is situated, was once an excellent harbour, but has long been choaked up with sand, so that all attempts to recover it have proved abortive; and it now hardly deserves the name of a port. Nature has, however, formed a very commodious place for a harbour here; and could any method be found out to prevent the sands from driving in hither, and removing those already accumulated, it would be one of the best harbours on the southern coast of England for trading vessels: but this is rather to be wished for than expected, however advantageous it might prove to the nation in general, and the town of Bridport in particular. The fishermen of Bridport take here such quantities of mackerel during the season; that it has been sometimes found necessary to set proper watches, to prevent the farmers in the adjacent parts from manuring their lands with them, lest the smell of such a number of putrid fish should affect the air, and prove fatal both to themselves and their neighbours.

About two miles west of Bridport is a small village, called Chediak, situated at the mouth of a little river, the mouth of which is a tide-haven for small vessels, where they lie a-ground at low water.

Four miles still farther to the westward, the little river Char falls into the sea; forming a harbour for small vessels, which go up to Charmouth, a small town about a mile from the sea. The Danes were here totally routed by the English; and hither king Charles II. retired after the battle of Worcester, with a design to procure a passage into France; but being suspected by the captain of the vessel, he withdrew to Salisbury.

Two miles farther to the west is Lime, Lime Regis,

or King's Lime, situated at the mouth of a small river. Its harbour, called the Cobb, has been, of late years, greatly improved, at the expence of several eminent and substantial merchants; and is so well secured against all the attacks of tempestuous weather, not only by a lofty and thick stone wall, to a considerable distance into the sea, but also by a great number of lofty trees, that there is hardly such another to be found in all his majesty's dominions. The wall, or pier-head, already mentioned, is broad enough for carriages and warehouses; one of the latter belongs to the officers of the customs.

There is not, in this whole county, one river rendered navigable by art; nor indeed any stream that would be of sufficient advantage to the county, to induce persons to undertake it, except the Frome, which might easily be rendered navigable from Wareham to Dorchester, and could not fail of paying the necessary expences: at the same time, it would prove of the greatest advantage to the county, by reviving the manufactures which formerly flourished here.

A I R A N D S O I L.

The air of this county, which has been often stiled the garden of England, is, in general, very healthy. On the hills it is somewhat sharp, but mild and pleasant in the valleys, and near the coast. The soil is rich and fertile: the northern part, divided from the southern by an almost continued ridge of lofty hills, was formerly covered with woods, but now affords excellent pasture for black cattle, being watered by many streams which flow through beautiful meadows. The southern parts, which consist chiefly of fine downs, feed an incredible number of sheep, remarkable both for the sweetness of their flesh and the fineness of their wool. The vallies are remarkably fruitful in corn, flax and hemp, the last of which is allowed to be the best of any produced in the British dominions.

Here are still extensive woods of very fine timber, which flourish here, especially in the northern parts of the county, extremely well; and some very considerable plantations have been lately made here.

Remarks on the HUSBANDRY of Dorsetshire.

Agriculture, in this county, is principally confined to the vallies, where they have, in general, good crops of corn. Their course of husbandry is, in general, 1. fallow; 2. wheat; 3. barley; 4. oats, pease, beans, or tares. Or, 1. fallow; 2. wheat; 3. barley; 4. clover, or rye-grass for two years. They plow three or four times for wheat, sow about three bushels upon an acre, and reckon three quarters a middling crop. We were told by a very intelligent farmer, that four quarters and a half is not uncommon. For barley, they plow from once to thrice, sow four bushels on an acre, and reap three quarters and a half, or four quarters. They plow twice for beans, sow four bushels on an acre, and reap about three quarters, when they are not hoed; or between four and five when that operation has been regularly performed.

The labourer has ten-pence a day the whole year, except in harvest, when he is allowed one shilling and eight-pence. The general price for reaping wheat is five shillings *per* acre; for mowing corn, ten-pence; and for mowing grass, one shilling and eight-pence.

The farmers near the sea-coast use the ore-weed, either by itself, or mixed with sea-sand for manure; and some of them, which is certainly still a better method, make a compost dunghill with ore-weed, sea-sand, rotten straw, the dung of animals, &c. and when all these substances are well blended and incorporated together, carry it out on their arable lands, to their great advantage.

The farms here are unequal, some of them being very large, and others very small, and the rents are from seven to fifteen shillings *per* acre. We were surprized not to find the turnip husbandry more generally practised

than it is, especially as they keep such large flocks of sheep. Those we saw looked very well; and many fields were hoed according to the practice of the new husbandry, and promised fair to produce excellent crops.

TRADE and MANUFACTURES.

This county has considerable manufactures, both of woollen and linen, though the former is not so great as it was some years ago. Their chief trade, besides their manufactures, consists in corn, cattle, wool, and stone; great quantities of which, especially of the three latter, are continually sent from hence into other counties. A considerable trade is also carried on at the sea-ports of Lyme-regis, Weymouth, and Pool; and the merchants of the latter, besides coasting vessels, keep many large ships employed in the West India and Newfoundland trades.

BOROUGH and MARKET TOWNS.

The first place we visited in this county was Sherborn, situated on the post-road from London to Exeter, one hundred and eighteen miles distant from the former. It is divided by the river Ivel into two parts, and distinguished by the names of Sherborn and Castletown. The latter has its name from a castle built here by Roger, the third bishop of Salisbury; but king Stephen, incensed at the bishop's pride, seized it, and it remained in the hands of his successors till the year 1350, when it was recovered from the crown by Robert Wyvil, a bishop more remarkable for his courage than his learning. This castle was the first that was formally besieged in the civil wars between king Charles I. and his parliament, and also the last that held out for the king.

Sherborn was made a bishop's see in the year 704, by Ina, king of the West Saxons; and twenty-five bishops sat here successively till the eleventh century, when it was united to the bishoprick of Sunning, and removed to Salisbury. On the removal of the bishoprick, this county became part of the diocese of Salisbury, till Henry VIII. erected a new see at Bristol, to which diocese it has ever since belonged.

Soon after the translation of the see, the cathedral was converted into an abbey-church. This structure is still standing, and is a very magnificent edifice, both within and without. In a word, it is by far the best building in the county, and was so greatly valued by the inhabitants at the reformation, that it is said they purchased it, and, to save it, pulled down three churches and four chapels, situated in different parts of the place. In a quarrel that formerly happened between the townsmen and the monks, a great part of the church was burnt, and the former were obliged to repair it. Near the entrance from the porch, lie interred Ethelbald and Ethelbert, two Saxon kings, who lived about two hundred years before the conquest; and in one of the isles is a superb monument, erected to the memory of John Digby, earl of Bristol, who died in the year 1688, and is said to have cost upwards of fifteen hundred pounds. In the tower of the church are six bells, so large, that they require near twenty men to ring them.

This town was formerly the retiring place of William the Conqueror, and belonged to his successors during several centuries, and will ever be famous for being the place where the prince of Orange was met by prince George of Denmark, the dukes of Ormond, Grafton, Marlborough, and many others of the principal nobility of the kingdom, on their deserting king James II. at Salisbury; by which the constitution of England was restored, without spilling the blood of its inhabitants.

Here is a free-school, founded by Edward VI. a fine alms-house, by Richard Beauchamp, bishop of Salisbury, and a charity-school.

Though Sherborn never had representatives in parliament, yet it sent William Turpin, and two other deputies, to a council held at Westminster in the reign of Edward III.

The number of inhabitants of this town are thought to amount to twenty thousand souls, a number much greater than that of any other town in the county. The inhabitants

Inhabitants formerly made great quantities of medley-cloth; but their chief manufactures at present are buttons, bone-lace, and haberdashery wares, with which they supply all the western parts of the kingdom.

Here are two weekly markets, held on Tuesday and Saturday, and four annual fairs, viz. Saturday after Holy Thursday, for all sorts of cattle; the eighteenth of July, for wool and cattle; the twenty-sixth of July, for wool and lambs; and the first Monday in October, for wool, and all sorts of cattle.

An house of regular canons was established here about the year 700; but in the year 998, Wilfin, bishop of Sherborn, with the consent of king Etheldred, changed these canons into Benedictine monks, and built an abbey for their residence, the revenues of which were confirmed by pope Eugenius the third, in the year 1145. The abbey was dedicated to St. Mary, and the revenues of it, upon the general suppression, were rated at six hundred and eighty-two pounds, fourteen shillings and sevenpence *per annum*.

Not far from the abbey-church, an hospital was begun by the townsmen in the fourth year of the reign of Henry VI. and eleven years afterwards, it was incorporated by the same prince, under the name of the Master and Brethren of the Alms-houses of St. John the Baptist, and St. John the Evangelist; and was to consist of twenty brethren, from whom a master was to be annually elected, twelve poor men, four poor women, and a chaplain; to be governed by such ordinances as should be established by Robert Nevil, bishop of Salisbury, Sir Humphry Stafford, Knt. Margaret Goghe, John Faunteroy, and John Baret, or any two of them.

At Hermitage, a village about seven miles south of Sherborn, is a chasm in the earth, whence a large plat of ground, with trees and hedges on it, was removed, entire, to the distance of forty rods, by an earthquake, which happened on the thirtieth of January 1585.

Evershot is a small market-town, situated near the source of the river Frome, on the borders of Somersetshire, one hundred and twenty-three miles from London. It stands at the foot of a ridge of hills, in a very obscure situation, and affords nothing worthy the notice of a traveller. The market is held on Saturday: besides which, there is an annual fair held here on the twelfth of May, for the sale of bullocks and toys.

Bemister, which we next visited, is situated near the borders of Somersetshire, one hundred and thirty-two miles from London. It is a peculiar vicarage of the church of Salisbury, had once a chantry, and has still a good charity-school. Here is a weekly market on Thursday, and an annual fair on the twenty-ninth of September, for horses, bullocks, sheep, and cheese.

At Melpath, a village about three miles to the south of Bemister, lived Sir Thomas More, who being sheriff of Dorsetshire in the year 1533, ordered, in a frolic, all the prison doors in the county to be thrown open, and the malefactors to be set at liberty; but afterwards reflecting on the folly and danger of what he had done, applied, in a very penitent manner, to Sir Thomas Powlet, then lord treasurer to Henry VIII. to intercede with the king in his behalf. Powlet consented; and one of More's daughters, who were coheiresses in his fortune, which was very large, soon after married Powlet's second son; and this is said to have been made the condition of his intercession.

Lime, to which we now directed our course, is situated at the mouth of a small rivulet of the same name, on the borders of Dorsetshire, one hundred and forty-four miles from London. It is also called Lime Regis, or King's Lime, probably from its having been annexed to the crown in the reign of Edward I. who granted it a charter, with every privilege enjoyed even by the city of London, as a court of hustings, and a freedom from all tolls and lastage. These privileges were confirmed by Edward second and third, James I. Charles I. and king William and queen Mary. The corporation now consists of a mayor, a recorder, fifteen capital burgeses, a town-clerk, and other officers. The mayor is a justice of peace during his mayoralty, and the year following, and in the third year, he is both justice and coroner.

Two of the capital burgeses are also justices of the peace.

The town stands on the declivity of a hill; and some of the houses being large, and well built of free-stone, and covered with blue slate, make a fine appearance at a distance, by rising gradually one above another. Here is only one church, but the structure is capacious, and built in the Gothic taste. A rivulet runs through the middle of this town; but, by its situation on the side of a steep rock, the merchants are obliged to land their goods on the pier, called the Cobb, where there are proper warehouses for their reception.

The Cobb is a quarter of a mile from the town, and formed by a very substantial stone wall, running out a considerable distance into the sea, as we have already observed. Without this wall there is another of equal strength, which is carried round the end of the first wall, and forms the entrance into the port. The mayor and burgeses are at the expence of keeping the Cobb in repair, and are accordingly empowered to dig stone on the shore, and provide all other materials necessary for that purpose. The lower part of the town, which lies at the foot of the rock near the sea, is so low, that at spring-tides the cellars are overflowed to the height of ten or twelve feet, to the great damage of the inhabitants. The custom-house stands upon pillars, and underneath it is the corn-market.

Lime had formerly a good trade to France, Spain, the Straits, Newfoundland, and the West Indies, during which the customs amounted to near sixteen thousand pounds *per annum*. At present, the trade is considerably decreased. The merchants have, however, begun to trade in the pilchard fishery to considerable advantage, but not so largely as they do farther to the west, the pilchards not coming up in such prodigious shoals so far to the eastward.

On the eleventh of June, in the year 1685, the duke of Monmouth arrived here in a man of war of thirty guns. His army consisted of no more than one hundred men, but they had arms sufficient for four thousand. After his defeat, many of his party were executed here, and their limbs hung up in different parts of the town.

Lime has sent two members to parliament ever since the twenty-third year of the reign of Edward I. It has a good market on Saturday, and two annual fairs, the first on the second of February, and the second on the eleventh of October; both for the sale of cattle.

A little to the north-east of Lime, is a small village called Winford-eagle, near which a burrow or tumulus was opened not many years ago. On removing the earth, they found it full of large flints, and at length discovered a cavity resembling an oven, regularly formed, and coated on all sides with clay. In the middle of this cavity was an urn exquisitely wrought, containing a considerable number of very firm bones, and under them a large quantity of black ashes. The cavity, when first opened, was affirmed to be hot enough to bake bread. In digging further in the same tumulus, sixteen other urns were found, but not in cavities, filled with bones and ashes like the first.

Leaving Lime, we continued our journey, near the sea-coast, to Bridport, and passed through Charmouth, a small town situated at the mouth of the Charmouth, and remarkable for being the place where the Danes landed more than once; but affords nothing worth the observation of a traveller.

Bridport is situated near the mouth of a river on the English channel, one hundred and thirty-nine miles from London. It is the capital of its hundred, had a mint in the time of the Saxons, and was made a borough by Henry III. by whose charter the manor was leased to the inhabitants in fee-farm, for a small quit-rent, payable to the Exchequer at Michaelmas, and collected by the bailiffs of the town.

It was incorporated by Henry VII. and afterwards by queen Elizabeth; but the charter by which it is now governed was granted by James I. By this charter the corporation consists of fifteen capital burgeses, out of whom two bailiffs are annually chosen, a recorder, and town-clerk, who, with the two bailiffs, are justices of the peace. By this charter the corporation also obtained

tained a power to build a prison, have a common seal, and to hold lands and tenements; the bailiffs to have all fines, and other privileges, and to have two serjeants to carry maces before them. The town-hall is a mean building, though the quarter-sessions for the county are held in it once a year. Here are two churches, but one of them is very old and ruinous; and a good stone bridge over the river.

The town has at present but little trade; and would have less, were it not a thoroughfare on the great western road. It was formerly so famous for the manufacture of hemp, ropes, and cables for ships, that by Henry VIII. and confirmed by successive parliaments during a period of sixty years, it was enacted, that all the cordage of the English navy should, for a limited time, be made in this town, or within five miles of it; but very little of this great trade now remains, though the country between this town and Bemister produces as fine crops of hemp as any in the kingdom.

Bridport has a harbour for small vessels: it was formerly a pretty good one, and occasioned a considerable trade to be carried on here; but, in consequence of a dreadful mortality, which swept away the greater part of the inhabitants, it was so neglected, that the entrance was barred up by sand washed in by the tide; and though an act of parliament passed in the year 1722, for rebuilding the pier, and cleansing the harbour, it has not yet been carried into execution.

This town sends two members to parliament, has a weekly market on Saturday, and three annual fairs, viz. the fifth of April, for bullocks and sheep; Holy Thursday, for cheese, sheep, and cattle; and the tenth of October, for cattle and pedlars wares.

On the west side of Bridport-bridge is the chapel of St. John, and probably belonged to the hospital dedicated to St. John, valued, on the dissolution, at nine pounds and eight-pence *per annum*. Here was also a priory, whose revenues, at the dissolution, amounted to no more than six pounds *per annum*.

At Lodres, a village in the neighbourhood of Bridport, was an alien priory, subordinate to the abbey of Mountsburch in Normandy, to which this manor was given by Benedict, or, as others say, by Richard de Redveris, in the time of Henry I. on which account the abbot of that foreign monastery was a prebendary of the cathedral church of Salisbury, and had a house in the close there. Richard II. bestowed this cell, then worth eighty pounds *per annum*, on the priory of St. Anne, near the city of Coventry, in Warwickshire, during the war between England and France; but in the first year of Henry IV. it was restored to its original institution. After the dissolution of foreign houses, in the reign of Henry V. Ladres was made part of the endowment of Sion-abbey, in Middlesex.

Leaving the sea-coast, we crossed the river Frome to Fromton; a small market-town situated on that river, one hundred and seventeen miles from London; but has nothing remarkable, except a noble structure of Portland stone, eighty feet in front, belonging to Mr. Brown; and a bridge over the Frome. Here was formerly a priory of black monks, subject to the abbey of St. Stephen in Normandy, to which it was given by William the Conqueror. During the wars between England and France, this, with other alien priories, was seized by the king, and, for some time, farmed at one hundred and twenty merks *per annum*; but, on the suppression of foreign houses, it was given to the dean and canons of St. Stephens, Westminster. These enjoyed it till the dissolution of religious houses, when it was purchased by the ancestor of the late Sir John Brown.

The market is held on Thursday; besides which there are four annual fairs, viz. the fourth of March, the seventh of March, the first of August, and the fourth of September; all for cattle.

Cerne-abbey is situated on a small river of the same name, which falls into the Frome about four miles below this town, and one hundred and twenty-four miles from London. It was formerly famous for an abbey of black monks founded by St. Austin, afterwards archbishop of Canterbury, after he had destroyed the altars of

the Saxon god Keile, whom the inhabitants worshipped as the preserver of their health: but, in succeeding times, it suffered many changes, and was at last almost ruined, so that, in the year 953, it was possessed by three monks only, when Ailmer, earl of Cornwall, assisted by Dunstan, archbishop of Canterbury, rebuilt and enlarged the original structure, and changed the black canons for Benedictine monks. It was first dedicated to St. Mary, St. Peter, and St. Benedict, and afterwards to St. Edwold and Athelwold. Canute the Dane plundered both the church and monastery; but after his conversion to christianity, he became its great benefactor, endowing it with lands and privileges. After this, the abbey continued in a very flourishing state till the dissolution of religious houses, when its revenues amounted to five hundred and fifteen pounds, seventeen shillings and ten-pence *per annum*.

The abbey-church is wholly destroyed, and the parish-church erected on the spot where the former stood. The gate of the abbey is yet standing, and over it the arms of Richard earl of Cornwall, and king of the Romans.

The town, which formerly subsisted by the abbey, has, since the dissolution, fallen to decay, having no manufacture for the employment of the inhabitants. It has, however, still a weekly market on Wednesday, and four annual fairs, viz. the eighteenth of March, Monday after Mid Lent Sunday, Holy Thursday, and the second of October, for horses, bullocks, and hogs.

From Cerne-abbey we followed the course of that river to its influx into the Frome near Walton. The Frome, a little above that influx, divides itself into two branches, forming an island about two miles in length, and half a mile in breadth, at the eastern extremity of which the streams again unite. We crossed this island, which is divided into beautiful meadows, to Dorchester, the capital town of the county.

Dorchester is situated on the south side of the river Frome, one hundred and twenty-three miles from London. It was first incorporated by James I. but the charter by which it is governed was granted by Charles I. The corporation consists of a mayor, a recorder, two bailiffs, six aldermen, and six capital burgessees, besides a governor, who is annually chosen by twenty-four common council-men, and whose office chiefly consists in looking after the trade of the town. A court of common council, assisted by five of the capital burgessees, determines all matters relating to the privileges of freemen. This being the county town, the assizes, and, generally, the quarter-sessions, are held here, and here also the knights of the shire are elected.

The town is situated on a steep ascent, on the south side of the Frome, and commands a fine and extensive view of that river. It consists chiefly of three streets, which are well paved, and kept very clean; and the houses, though they are old and low, are very regularly built, the greater part of them, with stone. Here are three churches, a town-hall, and a county gaol, with its chapel. St. Peter's church and the town-hall stand in one street, Trinity-church and the Shire-hall in another, and All-Saints-church, below which is the county-gaol, with its chapel, in the third. St. Peter's church is a handsome structure, and in the windows of it are several monuments of the Chidcock family, which were removed hither when the priory church was pulled down. There is a traditional rhyme with regard to the founding of this church:

Geoffery Van,
With his wife Anne,
And his maid Nan,
Built this church.

But there was, long since, dug up in a garden here, a large seal, with indisputable marks of antiquity, on which is the following inscription: SIGILLUM GALFRIDI DE ANN. It is therefore, with great reason, supposed, that the founder's name was Ann. The other churches have nothing remarkable.

Here is a good free-school, and near it a handsome alms-house; besides which, there are two other alms-houses, the donations of private gentlemen.

This

This town was once famous for a manufacture of broad-cloth and serge; but the former is entirely lost, and the latter very inconsiderable. Great quantities of malt are, however, still sent to Bristol, and other places, every year; and the town is noted for excellent cakes, and incomparable beer.

Dorchester was the most considerable station of the Romans in these parts, and in the Saxon times, it had two mints and a castle. The latter was demolished by the Danes; but after the Norman conquest, a new one was erected and governed by some principal baron. This was also demolished, and out of its ruins was built a convent for grey friars, by John Chidcock, about the fourth year of Henry II.

The Isening street entered this town at the west gate. The ignorant country people will have it to be the work of the devil, who, they say, cast it up in one night's time. The foundation of the Roman wall appears quite round the town: on the east side, indeed, a street is built upon it, and the ditch filled up; but it is still called the Walls.

Near the town is a Roman amphitheatre, one hundred and forty-five feet wide, and two hundred and twenty long, which the vulgar call Maumbury: it affords an agreeable excursion for the inhabitants, and the terrace on the top is a noted place of rendezvous, affording an agreeable circular walk, whence there is a beautiful prospect of the town, and an extensive view over the adjacent country.

In the neighbourhood of this town is a lofty hill, on the summit of which is an area of above ten acres, fortified with five trenches, one within another, and having only two places whereby the fortification can be entered. The country people call it Maiden Castle, from a tradition that it was never taken; but is thought by the most intelligent antiquaries to have been a summer station of the Romans, when they defended the frontiers of this province.

The hospital of St. John the Baptist, commonly called St. John's House, in this town, was founded in the seventeenth year of Edward II. and granted the twenty-ninth of Henry VI. to Eaton-college, which grant was confirmed in the seventh year of the reign of Edward IV.

On the sixth of August 1613, a dreadful fire broke out in this town, which consumed three hundred houses, together with the churches of Trinity and All Saints. The damage was computed at two hundred thousand pounds: yet, what is very wonderful to relate, not a single life was lost in this terrible conflagration.

The town is surrounded with beautiful hills, on which there are often six hundred thousand sheep feeding at one time, within a circle of six miles radius, the town being supposed the center.

It is observable of these sheep, that they are exceeding fruitful; the ewes generally bringing two lambs at a time, and for this reason are greatly esteemed by most of the farmers in the eastern parts of England. The drovers purchase them at Burford fair, and drive them into Kent, Sussex, Buckinghamshire, Bedfordshire, and Oxfordshire. Even the Banstead downs, in Surry, so famous for fine mutton, are supplied from this place. The herbage of these downs is full of wild thyme, and other aromatic plants, which nourish the sheep to a great degree; and the herbage is again improved by the great quantity of dung made by these animals. The vallies also partake of this advantage, by the salts of the dung being washed down into them from the hills, by hasty rains.

This town has sent members to parliament ever since the original demand in the reign of Edward I. Here are two weekly markets, held on Wednesday and Saturday, and four annual fairs, viz. the twelfth of February, for black cattle and sheep; Trinity Monday, and the fifth of July, for black cattle and lambs; and the fifth of August, for black cattle, lambs, wool, and leather.

Near this town, in Blackman-forest, was formerly a house of Heremite friars, who were settled here before the year 1300; and Edmund earl of Cornwall, who had been a great benefactor, if not the founder of it, died here. But the friars seem to have forsaken their habitation some time before the year 1460; for after that pe-

riod, it is called a free chapel, the mastership of which was bestowed on several priests successively, till it was annexed to Cerne-abbey, in the fifth year of the reign of Henry VIII. It was dedicated to the Virgin Mary.

Leaving Dorchester, we directed our course to Weymouth, a sea-port town six miles to the south of Dorchester. The road is very agreeable, having almost constantly a prospect of the sea. The vallies were covered with corn, and the downs with innumerable flocks of sheep.

Weymouth is a clean, agreeable, well-built town, close to the sea, situated at the mouth of a little river called the Wey, one hundred and thirty-two miles from London. It has a custom-house, a convenient quay, and formerly carried on a considerable trade with France, Spain, Portugal, and the West Indies. The Newfoundland trade still flourishes here; the wine trade is also very considerable, and the merchants have a very large correspondence up the country, for the consumption of their returns. It sent members to parliament in the twelfth of Edward II. but after that time, till it was united to Melcomb-regis, it made only one return, which was in the nineteenth year of Edward II. It has no church, so that the inhabitants are obliged to go to Melcomb-regis, or to Wyke-regis, the mother church, in order to attend divine service. It had indeed formerly a chapel on the top of the adjacent hill, the declivity of which was so steep, that steps were cut in the ground to render the ascent more easy; but a detachment from the parliament's army, in the year 1641, converted it into a fort, from which they battered Melcomb-regis; and after reducing that town, demolished the chapel, and sold the stones.

Melcomb-regis, so called from its being anciently a demesne of the king, is separated from Weymouth by a small river called the Wey, over which there is a wooden bridge of seventeen arches. It has sent members to parliament ever since the reign of Edward I. which was some time before Weymouth enjoyed that privilege. In the reign of Edward III. it was in so flourishing a state, that it was appointed a staple by parliament; but in the succeeding reign, it was burnt by the French, by which the inhabitants were so greatly reduced in their circumstances, that they prayed and obtained a discharge from customs. The town, however, recovered it soon after, when quarrels arising with Weymouth, its privileges were removed to Pool in the reign of Henry VI. but restored by act of parliament in the reign of queen Elizabeth. This act was confirmed in the reign of James I. on condition that Melcomb and Weymouth should form but one corporation, and enjoy their privileges in common; and to this union is owing the flourishing state of both. This united corporation consists of a mayor, a recorder, two bailiffs, twenty-four capital burgeses, and an uncertain number of aldermen; because every person who serves the office of mayor, continues afterwards an alderman for life.

Melcomb has four good streets, and most of the houses are built of stone. Here are also a number of warehouses, and a very convenient quay for shipping and landing of goods. Here is a good market-place; the town-hall is also here, so that the members of the corporation living in Weymouth come hither to attend the public business, though the port generally goes by the name of Weymouth. The harbour is reckoned to be the best frequented in the county, and is defended by Sandford and Portland castles, built by Henry VIII.

These two boroughs, though united in one corporation, send four members to parliament: these are elected by such as have freeholds within the boroughs, whether they dwell here or not: the number of voters is near seven hundred: every elector, as in London, has the privilege of voting for four persons, who, when chosen, are returned by the mayor, in two distinct indentures, as the burgeses of Weymouth, and the burgeses of Melcomb-regis.

Two weekly markets are held at Melcomb for both towns, on Tuesdays and Fridays, and an annual fair, which holds three days, and begins on the sixteenth of June.

A few miles to the southward of Melcomb-regis lies that famous peninsula, called Portland Island, the sea having formerly flowed round it; but it is now joined to the main-land by a beach called Chessil Bank, which has been thrown up by the waves. It is not certainly known from whence Portland derived its name, some suppose it is borrowed from its situation opposite to the port of Weymouth; and others, from one Port, a Saxon, who annoyed this coast about the year 523, and possessed himself of this commodious spot of ground as an asylum, or safe retreat for himself and his fellow-pirates.

This peninsula is not above eight miles in compass, and thinly inhabited; for tho' it affords plenty of corn and pasture, yet wood and coal are so scarce, that the inhabitants are obliged to dry the dung of black cattle for fuel.

The inhabitants are, in general, stone-cutters; and, like the ancient Balears in the Mediterranean, were formerly the best slingers of any of the English. In this peninsula the best and whitest free-stone, of which, not only the cathedral of St. Paul, but likewise the Monument, and the greater part of the most magnificent structures in London, are built; and the quarries from whence these stones are taken are well worth the notice of the most curious naturalist.

Those who are pleased with shells will find on the sea-shore a very pleasing variety; but the most curious are the spirals, generally called screws. These are found in the stone, and of the same substance; so that it is often very difficult to get them out whole. They are perfectly solid, except a small tube running through the middle; and so nicely coiled about an imaginary axis, that the bore is as equal and regular as that of a capillary glass tube.

In some of the quarries on the south-west part of the island there is found a sort of stone which they call the sugarcandy stone, of which there are two sorts, one pale, like white sugarcandy, and the other of an amber colour, like the brown. The resemblance of both is so very perfect in the lump, that any person might be imposed upon till his tongue convinced him they were nothing more than an insipid exudation of juices, petrified, crystalized, and, if we may use the expression, candied up by nature in this manner.

The whole peninsula is indeed almost one continued rock of free-stone, and the land so lofty, that when the weather is clear and serene, the prospect is extended above half way over the English channel.

On the two points of this peninsula two light-houses are erected for the safety of mariners; and not far from these light-houses is a very remarkable hole through the earth, wide at the top; and after narrowing about seven or eight feet downwards, opens into a large subterranean cavern, where you see the waters of the sea, which, in boisterous weather, affords a most tremendous scene. This cavern is so large, that some of the small craft have been driven into it with their sails set, and seen through the hole.

Though Portland stands three miles at least from the main land, yet it is almost joined by a prodigious riff of beach, or small stones thrown up by the sea, and extending from the peninsula so near the shore, that they ferry over with a boat and a rope, not being above a stone's cast broad; and this riff of beach, from that inlet of water, turns away to the westward, running parallel with the shore quite to Abbotsbury, a town seven miles distant from the beginning of the beach.

On the inside of this beach, and between it and the land, is the inlet of water already mentioned. About two miles farther to the west, it grows very broad, forming a kind of lake within the land of about three miles in length, and half a mile in breadth. At the western extremity of this water is a large decoy, and the verge of the water over-grown with wood, and proper groves of trees and shrubs are added, to afford a proper cover for fowl. In the open and broadest part of the lake is, perhaps, the largest swanery in England: here these birds live and breed, and are so very numerous, that 7 or 8000 of them are seen flocking together; at the same time some of them are seen on the wing, very high in the air,

whence we may naturally suppose they fly over the riff of beach, which separates the lake from the sea, to feed upon the shore. From the decoy, the lake narrows by degrees, till at last the beach joins the shore, and connects Portland to the main land.

Abbotsbury, so called from an abbey which formerly stood, is a small market town, situate near the western extremity of the riff of beach above mentioned; 133 miles from London.

In the register of this monastery it is said, that one Bertufus a priest built a church here in the infancy of christianity, and dedicated it to St. Peter. Some time after, Abbotsbury became a retiring place to the West-Saxon kings, who being afterwards vanquished by the Danes, king Canute gave the manors of Abbotsbury, Portsham, and Helton, to Sir Orcius his steward, who presented those lands to the church of St. Peter, and, with the consent of Edward the Confessor, built, in the year 1044, a large monastery, and filled it with Benedictine monks from Cremil abbey. These donations were afterwards confirmed to the abbey by a charter granted by Edward the Confessor, and several succeeding kings and popes. In succeeding times the revenues of the abbey were so greatly increased, that the monks became very rich, and rebuilt both their church and monastery; adding to the former a beautiful chapel, which they dedicated to the Virgin Mary. They also erected upon the top of a rocky hill, about half a mile from the abbey, another chapel dedicated to St. Katherine. It was built entirely of stone, with an arched roof of exquisite workmanship. Part of this chapel is still remaining, but of no other use than that of a sea mark. After the dissolution of religious houses, both the abbey and church were demolished, and the bones of the founder Orcius, inclosed in a marble coffin, were removed to the parish church. The Virgin's chapel continued some time after the dissolution; but was afterwards demolished, and a mansion house built on the spot it occupied.

The town of Abbotsbury is small, and the inhabitants principally employed in fishing. It has, however, a market on Thursday, and a fair on July 10, for sheep and hogs.

Having viewed the famous peninsula of Portland, we crossed the passage, and proceeded near the sea coasts to what is called the Isle of Purbeck. It is not, however, properly an island, but a peninsula, and the isthmus that connects it with the main land half a mile in breadth. This peninsula is about ten miles in length, and five in breadth. We passed into this district over the stone bridge at West Hoken, and found the country on our first entrance to be barren and heathy, but replenished with red deer. This part is severed from the rest by an almost continued ridge of very high hills; on the other side of which are lands of a much better nature, affording excellent pasture for cattle and sheep, and plenty of fine corn. Here are also quarries of very hard and lasting stone, of which the cathedral church of Salisbury is built, and great quantities of it are sent to London, and other parts of the kingdom, to the great advantage of the inhabitants. Besides these quarries of stone, there are others of spotted and blue marble.

On the southermost point of this peninsula is a hill, the top of which is fortified with triple trenches, and known by the name of Frowers Burrow; but by whom this fortification was thrown up is now unknown.

About five miles to the eastward of Frowers Burrow is a promontory, on the top of which are the ruins of a chapel, which now serve as a sea-mark. This chapel, which was constructed wholly of stone, and the ceiling finely vaulted, was dedicated to St. Adeline, first bishop of Sherborn.

On the eastern point of land, called Studland, is a castle for the defence of Sandwich Bay, lying between Studland and Peverel Point.

The only place of note in this peninsula is called Corfe-castle, situated near the middle of the island, 116 miles from London. It has its name from a castle supposed to have been built by king Edgar, who endowed the town with many privileges.

Corfe-castle was many years a borough by prescription, and afterwards incorporated by queen Elizabeth. Charles I. as a reward for the gallant defence the castle made for him, granted the town an exemption from tolls, arrest, suit or service, without the barony. Charles II. gave the town a new charter, by which it is now governed, and enjoys every privilege in common with the cinque ports. Besides which, it has the peculiar honour of annexing the title of Baron to its principal members, the stile of the letters of incorporation being the mayor and barons of Corfe-castle, and all the barons who have served the office of mayor are justices of the peace, and can hold sessions, chuse coroners and ale-tasters, during life. The lord of the manor is, by inheritance, lord lieutenant of the isle of Purbeck; has power to appoint all officers; to determine all actions by his bailiffs and deputies; has all shipwrecks in the isle, and a freedom from the jurisdiction of the court of admiralty.

The town itself is but small, and has nothing remarkable, except a very lofty and spacious church, which is a royal peculiar, not liable to any episcopal visitation or jurisdiction, and has a chapel of ease about a mile out of town.

The castle, from whence the town took its name, is supposed to have been built by king Edgar, who made it the place of his residence, and is thought to have been the strongest in the kingdom. It was given by that monarch to Elfrida, his second queen, who retired thither with her son Ethelred, on his being prevented from ascending the throne, by the intrigues of Dunstan and his party.

Elfrida, fired with the injury done to her son, was daily contriving schemes for the destruction of Edward, the innocent monarch: nor was it long before an opportunity offered of putting her cruel design in execution. It happened one day, as Edward was returning from the chase, and having missed his attendants, he found himself near Corfe-castle, where his mother-in-law, with her son, then resided. Edward had always shewn her the greatest respect; and being also very fond of his brother Ethelred, he determined to pay them a short visit. On his arrival at the castle-gate, Elfrida received him in the most affectionate manner, pressing him to alight and take some refreshment; but the young monarch excused himself, by saying, that his stay would alarm his attendants, whom he had left in the forest; and therefore would only, for the present, take a cup of wine on horseback, being very thirsty. Wine was accordingly brought; but as the prince was lifting the goblet to his mouth, he was stabbed in the back by a ruffian, whom Elfrida had posted behind him for that purpose, when she found that all her entreaties could not prevail on Edward to dismount and enter the castle. The king, finding himself wounded, instantly set spurs to his horse; but before he had rode many paces, fainting with the loss of blood, he fell from his saddle, and one of his feet catching in the stirrup, his horse dragged him a considerable distance over the rugged road, till at last the beast stopped of its own accord at the house of a poor blind woman, situated by the way side, where some of Elfrida's domestics, who traced him by his blood to the place, found the corpse terribly disfigured by being dragged over the stones. As it was necessary to conceal this murder as long as possible, the body was thrown into a well, where it was afterwards found, and carried to the nunnery of Wareham in this county; whence it was afterwards conveyed to Shaftsbury, and deposited in a monastery founded there by king Alfred. This catastrophe happened in the year 979. In the time of Henry III. when that prince was taken prisoner by Simon Montfort, in the forty-second year of his reign, Corfe-castle was one of the three fortresses Montfort desired might be delivered up to him; and it was afterwards chosen by Mortimer for the prison of Edward II. It was repaired by Henry VII. and afterwards by Charles I. who placed a garrison there; but after a brave defence, it was taken thro' treachery by the parliament's forces, who plundered and demolished it. It appears from the ruins, that the castle was near half a

mile in circumference; and that it was both a strong and magnificent building.

Wareham was the next place we visited. It is about four miles from Corfe-castle; and 108 from London. The place it stands in is one of the most healthy spots of the county, tho' almost surrounded with water, having the river Frome on the south, the Priddle on the north, and the bay, into which both these rivers fall, on the east. The inhabitants say it rose out of the ruins of Stowborough; now a village on the other side of the Frome. But however this be, it is considered as one of the oldest towns in the county, and was of some note in the time of the Romans. In the time of the Saxons it had two mints, and was afterwards surrounded with walls, and defended by a strong castle built by William the Conqueror. The sea then came up to its walls, and a very considerable trade was carried on, by which means the town was in so flourishing a condition, that there were seventeen churches within the walls. But during the wars between king Stephen and the empress Maud, it suffered very greatly; and the harbour being choaked up with sand, Wareham lost its former importance; together with its trade; so that its churches are now reduced to three, St. Mary's, Trinity, and St. Martin's. St. Mary's was formerly the priory church; and its tower, which is lofty, and finely decorated, is now the chief ornament of the place, which consists chiefly of two streets, and about two hundred houses.

It is an ancient borough by prescription, and incorporated by queen Anne, by whose charter, the corporation consists of a mayor, a recorder, a town-clerk, six capital burgeses, and twelve common-council men, with their assistants. The mayor, by an old prescriptive right, is coroner, not only of the town, but also of the isle of Purbeck, and Branksey island, another small isle in Pool-bay: in the latter he has been supreme magistrate ever since the reign of Henry VI. and the mayor in office, the preceding mayor, and the recorder, are justices of the peace; the two former are of the quorum, and empowered to hold their own sessions. It is said, that Briaticus, the last of the Saxon kings, during the heptarchy, was buried here.

The principal trade of Wareham at present consists in tobacco-pipe-clay, of which the best in Great Britain is dug out of a hill in the neighbourhood, called Hunger

We have already observed, that Wareham had once a strong castle, built by William the Conqueror; and shall now add, that no traces of that structure remain, except the place of its situation, which is still called Castle-hill. Here once lived a recluse, called Peter the Hermit, who was hanged, together with his son, in the time of king John, for having prophesied, that the king would be deposed at a certain time which he named; but it does not appear whether he was put to death before or after that period; all we know is, that he submitted cheerfully to his sentence.

A nunnery was founded here pretty early in the Saxon times, and afterwards demolished by the Danes. In this nunnery the body of Edward, who was murdered by Elfrida at Corfe-castle, was at first deposited. After the nunnery was ruined by the Danes, Robert earl of Leicester gave one, if not more of the churches, together with lands in the neighbourhood, to the convent of Lira, in Normandy, in the reign of Henry I. In consequence of this donation, the convent sent over and settled here a convent of their own Benedictine monks, dedicating the structure to the Virgin Mary. When the alien priories, during the war with France, were seized by the king, the revenues were given to the priory of Montgrace, near Northallerton, in Yorkshire, which convent continued to receive them several years; but when the foreign houses were dissolved by Henry V. he gave this priory to the Carthusians of Shene, near Richmond in Surry.

This town sends two members to parliament, who are chosen by the inhabitants, paying scot and lot, who amount to about one hundred and fifty; and here is a weekly market on Saturday, and three annual fairs, viz the seventh of April, the fifth of July, and the eleventh of September, for hogs and cheese.

Having surveyed this ancient town, now greatly fallen from its former grandeur, we embarked on board a fishing vessel, and, after a pleasing voyage on the lake, we landed at Pool, one of the most considerable towns for trade in this county.

Pool has its name from the lake, which almost surrounds it, and which, in calm weather, appears like a pool of standing water. This sheet of water, which extends to Wareham, is called Laxford-lake, and remarkable for the water rising and falling four times in twenty-four hours. On a point of land, in the north-west part of this lake, the town of Pool is situated, one hundred and ten miles from London.

By a charter of queen Elizabeth, this town is separated from the county of Dorset, and made a county of itself, with the privilege of a sheriff keeping a court, to determine all causes, both civil and criminal, with divers other immunities, several of which it still enjoys; particularly the right of trying malefactors within its own jurisdiction, by a commission from the crown, which saves the town the expence of entertaining the judges on the circuit. This borough and county is governed by a mayor, a recorder, aldermen, a sheriff, a coroner, a town-clerk, bailiffs, and common council-men. The mayor, who is also admiral within the liberty, is chosen from among the burgessees; and after he has passed the chair, is always an alderman, and the first year after his mayoralty, the senior bailiff, and a justice of the peace. Three justices are chosen annually from among the aldermen, the mayor being of the quorum, and the election of the freemen and burgessees must be made by the mayor, four aldermen, and twenty-four burgessees.

The houses, which amount to about four hundred in number, are low, but built of stone. The church, which is a royal peculiar, is a large stone structure, but the tower is low, and the wings larger than the body, and unequal to each other. Here is an elegant town-hall, built of stone, a custom-house, a quay, and a charity-school. Here is also a large warehouse, called the Town-cellar, for keeping goods and merchandize.

This town is one of the most considerable ports in the west of England, and several of its merchants have represented it in parliament. It carries on a considerable trade to France, the West Indies, and Newfoundland, about two hundred sail of merchant ships belonging to it.

The bay is noted for plenty of fish, particularly mackerel, at the proper season. The oysters here are larger, and contain more pearls than any other in England. They are pickled and barrellled up here, and sent to London, the West Indies, Spain, Italy, and other places. Great quantities of corn, pulse, and Purbeck stone, are also exported from this town.

Pool sent members to parliament in two sessions during the reign of Edward III. but we find no returns afterwards, till the reign of Edward IV. When Henry VI. disfranchised the port of Melcomb-regis, he transferred that privilege to this place, and gave the mayor leave to inclose it with walls, which Richard III. begun at the haven; and since the time of queen Elizabeth, the return of members has been regular.

On the twentieth of June 1653, a shower of blood is said to have fell in this town, from a black cloud, which tinged the leaves of the trees with red. Several of these leaves were sent to London, and considered as great curiosities at the time when it happened.

Here are two weekly markets, held on Monday and Thursday; besides which, there is an annual fair, or free mart, on the first Thursday in November, for toys, &c.

About eleven miles to the westward of Pool, is a small market-town, called Bere-regis, situated on a rivulet of its own name, one hundred and five miles from London. It has nothing worth remarking, but a small charity-school, and a market on Wednesday.

In the neighbourhood of this town is Woodbury, or Woodberry-hill, the remains of a Roman fortification, a triple ditch, and a stone wall, the work of the Romans, and the distance from them this hill to Old Sarum, in

Wiltshire. This hill is famous for a large fair held here on the eighteenth of September, for the sale of all sorts of cattle, hops, cheese, cloth, haberdashery, and a great variety of other sorts of goods.

Wimborn-minster, or Winborn-minster, is situated between the two rivers Allen and Stour, near their influx, one hundred and seven miles from London. The word Minister is added from its monastery, in which the West Saxon monarch, Etheldred, was buried, after being slain by the Danes, in the year 873.

This is the largest parish in the county, and has a noble church, built in the form of a cathedral, one hundred and eighty feet long, with a fine tower at the west end, and another in the center: the latter had on it a lofty spire, which fell down in the year 1600, at the time of divine service, when the choir was full of people, without hurting any person, though both the lead and roof were greatly damaged. Both these towers are each ninety feet high. This is the only choir in the county; it consists of four singing-men, six boys, and an organist. Margaret, countess of Richmond, mother to Henry VII. founded a fine free-school here, the stipend of which was augmented, and annexed to the foundation, by queen Elizabeth.

Wimborn is a populous, but poor town, and chiefly supported by the stocking manufacture.

In the time of the Romans, this was one of the two winter stations for their legions, Dorchester being the other: the summer station was on Woodbury-hill, at some distance from this town, as we have already observed. The Romans left many marks of their magnificence in Wimborn, and on that account the place was held in the highest veneration by our Saxon ancestors.

Some time before the year 705, St. Cuthburga, daughter to Kenred, king of the West Saxons, and sister to king Ina, founded an abbey for holy virgins, and dedicated it to the Virgin Mary. The foundress retired to this abbey, where she died; and here king Etheldred was buried, as we have already observed. The tomb of this prince was repaired when the church was rebuilt, and the following inscription placed upon it:

In hoc Loco quiescit Corpus S. Etheldredi Regis West Saxonum, Martyris, qui, Anno Domini DCCCLXXXII. XXIII. Aprilis, per Manus Danorum Paganorum occubuit.

“ Here rests the Body of the Martyr St. Etheldred, “ King of the West Saxons, who was slain by the “ Hands of the Pagan Danes, on the twenty-third of “ April, in the Year of our Lord 882.”

It was soon after destroyed by the Danes, and the church ruined, till one of our Edwards rebuilt the church for secular canons; so that it became a royal, free, and collegiate church, consisting of a dean, four prebendaries, three vicars, four deacons, or secondaries, and five singing-men; and it has ever since continued a sort of choir. At the suppression of religious houses, the revenues amounted to one hundred and thirty-one pounds fourteen shillings *per annum*.

Blandford, which we next visited, is a large market-town, situated on the river Stour, over which it has a good stone-bridge, and in the high-road to Exeter, one hundred and ten miles from London. It is governed by two bailiffs, chosen annually out of the aldermen, or capital burgessees. It is at present a flourishing, well-built town, and much frequented by the gentry, who have seats upon pleasant eminences in the neighbourhood, called Burford Downs, extending from this town to Dorchester. The chief manufacture of this town formerly was band-strings, and afterwards straw-hats and bone-lace; but at present the principal traders are maltsters and clothiers.

In the reign of queen Elizabeth, a dreadful fire broke out here, by which the whole town was destroyed, but was soon after rebuilt; and on the fourth of June 1731, another terrible fire happened, when six hundred houses, the church, and other public buildings, were destroyed; together with a village beyond the bridge, in which only twenty-six houses were left standing. The progress

gress of this fire was so rapid, and the consternation of the people so great, that most of their goods and merchandize were destroyed, together with their houses. What still increased the misfortune was, its happening at a time when the small-pox raged greatly in the place; so that many of the sick, who were taken out of their beds to escape the flames, perished in the fields. An act of parliament was passed in the year 1732, for rebuilding this town, and for determining differences touching houses and buildings burnt down or demolished therein; and as several wise regulations were made by it, the town was rebuilt in a much better manner, and makes a more elegant appearance than ever it did before.

This town sent members to parliament in the reigns of Edward I. and Edward III. but not since. It has a weekly market on Saturday, and three annual fairs, held on the seventh of March, the tenth of July, and the eighth of November, for horses, sheep, and cheese.

At Rushton, a village four miles to the eastward of Blandford, was an old religious house, dedicated to St. Leonard, the patronage of which was granted to the prior and convent of Twinham, in Suffex, in the seventh year of Edward III.

At Tarrant Keynton, a village about three miles to the eastward of Blandford, Richard Poor, bishop of Chichester, then of Salisbury, and afterwards of Durham, founded an abbey of Cistercian nuns about the year 1230, and dedicated it to the Virgin Mary and All-saints. At the dissolution, it had a yearly revenue of two hundred and fourteen pounds, seven shillings and nine-pence.

In the parish of Gunville, four miles from Blandford, is the elegant seat of the late right Hon. George Dodington, Esq; The house, gardens, and park, containing about eight miles in circumference, is called Eastbury.

You approach the house through a beautiful lawn; and after passing through the grand arcade, on each side of which the offices are ranged, you land upon a flight of steps eleven feet high, under a noble Doric portico, crowned with a pediment extending thirty-two feet, supported by pillars forty-six feet high; whence you enter a most magnificent hall, adorned with many statues and busts.

The Salon is one of the finest rooms in the kingdom, and is beautifully and richly decorated. At one end of this salon are three noble apartments; one furnished with crimson velvet, another with flowered velvet, and a third with satin, all richly laced with gold. At the other end are a drawing-room, and a large dining-room. The marble tables in these rooms are exceeding curious, and of great value: they were purchased out of one of the Italian palaces.

The main body of the house extends one hundred and forty-four feet, and is ninety-five feet in depth, to which the arcades forming the great court are joined. This court is one hundred and sixty feet in breadth in the clear, and its depth from the house to the entrance two hundred and ten feet. The arcades are ten feet wide. The offices placed on each side of these arcades, extend each one hundred and thirty-three feet in breadth, and one hundred and sixty-one in depth. The inner courts of these offices are one hundred and sixty feet by eighty, in the clear. Beyond these other buildings are carried, in the same line, fifty feet each way, and which form two other courts; so that the whole front of the building and offices extends five hundred and seventy feet. These buildings being of different heights, and the beautiful turrets at each corner of the house, with their Venetian windows, rising above all the rest, give the whole structure a very grand appearance.

Middleton, or Milton, is a small market-town, situated six miles south-west from Blandford, and one hundred and sixteen from London. There is nothing remarkable in this town but the ruins of a monastery, built by king Athelstan, in expiation of his crime in destroying his brother Edwin, about the year 933.

Edwin was a young prince possessed of many noble and virtuous accomplishments; but these great qualities, instead of rendering him more dear to his brother Athelstan, awakened in that monarch's breast the most rancorous jealousy. He was sensible that the people, notwithstanding their submission, were not entirely satisfied

with regard to the legitimacy of his birth. He remembered that the traitor Alfred had coloured over his rebellion with the pretence of setting Edwin on the throne, as the only lawful heir of the deceased Edward: he saw his own dominions threatened by a powerful invasion, both from Ireland and Scotland; nor was he sure but some sparks of Alfred's rebellion might still remain in the hearts of his subjects, and which wanted only the breath of Edwin to blow them into a flame. Full of these ideas, he wished for nothing so much as a favourable opportunity of removing this dangerous competitor in the affections of his people. The virtues of Edwin, and all his professions of respect and loyalty, appeared to him only as so many specious arts to disguise the real sentiments of his heart. Court sycophants, who were ready to flatter the weakness of their prince at the expence of his honour and future happiness, were not wanting in the court of Athelstan: they represented all the actions of young Edwin in the most odious light; his humility they called deceit; his respectful behaviour they construed into design, and the act of the most horrid and detestable nature, represented as a prudent precaution. Unhappily Athelstan, who on every other occasion displayed many royal virtues; was not proof against the dictates of ambition, and the artful practices of his courtiers, who were incessantly representing; that not only his own welfare, but that of his people, was endangered by the popularity of Edwin, whom they at length openly accused of being an accessory in the late rebellion. In a word, the young prince was tried, and being found guilty by his suborned judges, was condemned to be put on board a leaky vessel, without provisions, or any other attendants than his armour-bearer and page, and in this condition committed to the mercy of the winds and waves. The unfortunate Edwin, unable to support the severity of the weather, the continual prospect of death, and the want of food, threw himself into the sea, and perished. It happened, that the chief promoter of this black transaction was cup-bearer to Athelstan. One day, as he was serving the king at table, he made a false step, and had nearly fallen on the floor, but recovered himself unexpectedly with one of his feet; upon which he said to the king, who indulged him with great freedoms, "See, Sir, how one brother assists the other." Athelstan, struck with these words, which were probably spoken without any intention, felt all the conscious horrors of guilt awakened in his soul; and whether he construed this expression of his cup-bearer into a tacit insult, or was determined to punish this incendiary, as an atonement to the manes of his murdered brother, is uncertain; however, he ordered a strict examination to be made into the charge brought against Edwin, and finding it had no foundation in truth, he commanded the perfidious cup-bearer to be put to a cruel death, and then endeavoured to expiate his own guilt by a profusion of penances, and benefactions to the church. Among other donations of this kind, was the monastery of Milton, which was dedicated to the Virgin Mary, St. Michael, St. Samson, and St. Branwalader. The monks were of the Benedictine order, and their revenues, at the dissolution, amounted to five hundred and seventy-eight pounds, thirteen shillings and eleven-pence *per annum*.

Milton has a small market on Monday, and a yearly fair on the Tuesday after St. James's day.

Sturminster Newton, to which we now directed our course, is a small market-town, stands on the northern bank of the river Stour, and joined to Newton-castle, situated on the other side of the river by a stone-bridge, one hundred and twenty-two miles from London. The town is a mean, obscure place, and has nothing remarkable. Newton-castle, on the other side of the river, was built upon a lofty, but artificial eminence, and was once a palace belonging to the West Saxon kings. This castle, with seventeen hides of land, Edmond Ironside bequeathed, together with his body, to the abbey of Glastonbury, in the year 1016. His will was complied with, his body buried in that abbey, and his successor Canute the great founded here a small cell for monks, the ruins of which still remain; but no vestiges of the castle, except the artificial hill on which it stood.

Sturmister has a weekly market on Thursday, and two annual fairs, the first on the twelfth of May, the second on the twenty-fourth of October, for cattle and toys.

About three miles above Sturmister is a bridge over the Stour, called King-flag-bridge, which, they say, had its name from the following incident. King Henry III. having diverted himself with hunting in Blackmore forest, which extends to this bridge, was so pleased with the beauty of a white hart he had chased, that he not only spared the creature's life, but also gave orders that no other person should kill it. But these orders were disregarded; for some time after, one Thomas de la Linde, with several of his companions, who were hunting in this forest, chased the same creature, and killed it at King-flag bridge. This action so enraged the king, that he laid all their lands under a pecuniary mulct, which, to this day, is annually paid into the Exchequer, under the name of White-hart Silver.

A few miles above this place is Statbridge, a small market-town, situated on the Stour, one hundred and fifteen miles from London. It has a charity-school, a weekly market on Thursday, and two annual fairs, viz. the sixth of May, and the fourth of September, for all sorts of cattle; but nothing else remarkable.

Shaftesbury, the next place we visited, is situated on the summit of a hill, in the great road to Exeter, eighteen miles from Salisbury, and one hundred and one from London. The hill on which it stands is part of the boundary of that large carpet-down called Salisbury-plain, and from hence is a beautiful prospect over part of the counties of Somerset and Wilts, where you see large tracts of inclosed land, interspersed with woods, and divided by quick-hedge-rows; the towns and houses thickly disseminated, and the whole wearing the aspect of cheerfulness.

Shaftesbury consists of about six hundred houses, many of which are of free-stone. It was built by king Alfred about the year 880, as appears from the following inscription, which Malmesbury the historian tells us was preserved here in his time:

Anno Dominicæ Incarnationis, ALFREDUS REX fecit hanc Urbem DCCCLXXX. Regni sui VIII.

“ This City was built by King Alfred, in the Year of our Lord's Incarnation 880, and the eight of his reign.”

In the time of the Saxons, it had three mints, and was the see of a suffragan bishop in the reign of Henry VIII. It is an ancient borough by prescription, was incorporated by queen Elizabeth and king Charles II. and is governed by a mayor, a recorder, twelve aldermen, two bailiffs, and a common-council. On the top of an adjacent eminence, called Park-hill, a fine grove of trees has been lately planted by a gentleman in the neighbourhood, as a walk for the inhabitants.

Water is so scarce in this town, that it was formerly brought on horses from Motcomb, a village about a mile distant; but in the year 1718, William Benson, Esq; one of its representatives in parliament, was at the expence of constructing engines, which raised the water from a well, about two miles off, to the height of above three hundred feet, and conveyed it to a large cistern, in the middle of the town. These engines, however, have, for some reason, been disused, and the inhabitants have dug pits at the doors of their houses, for preserving the rain-water, which not being sufficient for a constant supply, many of the poorer sort of the inhabitants get their living at this day by bringing water in pails, or on horses, to the town, from Motcomb. Before the above engines were erected, the mayor and burgeses of Shaftesbury, as an acknowledgment to the lord of the manor of Motcomb, used to go in procession every year on the Monday before Holy Thursday, with a kind of garland, consisting of plate, borrowed from the neighbouring gentry, and adorned with peacocks feathers. This garland, which is here called a prize-befom, was carried to a green at the foot of the hill, whence the water was taken, and presented, together with a raw calf's head, and a pair of gloves, to the lord of the manor, who re-

ceived the present by his steward, and at the same time distributed twelve penny loaves, and twelve dozen of beer, among the people. After the ceremony was over, the prize-befom was restored to the mayor, and carried back to the town by one of the officers, with great solemnity.

King Alfred built and endowed an abbey here for Benedictine nuns, about the year 888, dedicating it to the Virgin Mary, and placing in it Ethelgeda, his daughter. But after the body of Edward the martyr was removed hither from Wareham, his shrine was visited by such multitudes of superstitious people, that it was called “ The Monastery of the assumption of the blessed Virgin Mary, and St. Edward the martyr.” Even the town itself lost its old name, and was for some time called St. Edward's Town. At the dissolution of religious houses, the revenues of this monastery amounted to eleven hundred and sixty-six pounds, eight shillings and nine-pence *per annum*.

This town has sent members to the British parliament ever since the time of Edward I. It has a weekly market on Saturday, and three annual fairs for the sale of all sorts of cattle, viz. the Saturday before Palm-Sunday, the twenty-fourth of June, and the twenty-second of November.

Camden tells us, that Shaftesbury is said to have been the residence of one Aquila, a prophet, who foretold, that the government of Britain, after having been in the hands of the Saxons and Normans, would at length return to the ancient Britons, which prediction is thought to have been accomplished by the accession of Henry VII. and afterwards by the kings of Scotland, to the throne of England.

About four miles to the south-west of Shaftesbury, is the village of Stour Provost, which was given by Roger de Bellamont, father to Robert earl of Leicester and Mellent, in the time of William the Conqueror, to the nunnery of St. Leger de Preaux, in Normandy, by which it became a cell to that foreign monastery. After the suppression of alien priories, Henry VI. and afterwards Edward IV. granted this priory to King's-college, in Cambridge.

Cramborn was the last place we visited in Dorsetshire. It is a small, but a very agreeable market-town, well watered, and situated in a healthy, sporting country, near a very large chace, ninety-eight miles from London. Here is a weekly market on Thursday, and two annual fairs, the first held on the twenty-fourth of August, and the second on the sixth of December, for cheese and sheep.

Remarks on the SEA COASTS of Dorsetshire.

The south part of Dorsetshire is bounded entirely by the sea, the coasts of which are very dissimilar, consisting, in some places, of very high lands and cliffs, and in others, of only a beach of pebbles. Some of the cliffs are composed of sand, earth, and loamy clay, some of chalk, and some of stone; the latter are chiefly found in what are called the islands of Purbeck and Portland.

Before the port of Pool, there is a large bay, where ships come to an anchor in westerly winds. To the westward of this is another road, called Sandwich Bay, from a village of that name situated on the shore. This bay is formed by two points of land, one termed Handfast Point, on which is a block-house called Strudland-castle, and the other Peverel Point, over which is a very high land, called St. Alban's. Sandwich-bay is a very good road for ships, and on that account pretty much frequented, especially as there is no danger in going in, except a small ledge of rocks lying off Peverel Point. The best anchoring ground in this bay is off the village of Sandwich, where ships ride in four or five fathoms water. There is also a good road a little to the northward of Handfast Point, before the village of Stradland. Upon the outermost part of the above point is a hole in the cliff, through which you may see the water on the other side of the point; and a little without this point, is a high steep rock, entirely environed by the sea. The above hole in the cliff is used as a mark for ships to anchor in Strud-

land-bay, where there are between three and four fathoms water.

Four leagues to the westward of Peverel Point, is a little cove, called Lulworth-cove, from a village of that name at the bottom of it, where small vessels may ride in safety; but in going in, care must be taken to keep pretty close to the eastern point of the cove, for a ledge of rocks extends from the westernmost point to near the middle of the entrance.

About three leagues to the westward of Lulworth-cove, is Weymouth road, where ships ride in safety in westerly and northerly winds; but the winds between the east and S. W. blow into the bay, when there is no riding here in bad weather. The water is from ten to two fathoms deep, according as the ship is farther from, or nearer to the shore.

Portland-road lies a little to the southward of Weymouth-road, and is properly a part of the same bay. It is, however, safer than the former, as few winds can hurt vessels riding there, especially if pretty near the shore off Portland Castle.

The sea about this peninsula, especially a little to the west of Portland, is reckoned the most dangerous part of the English channel, occasioned chiefly by a continual agitation of the water, produced by the meeting of two tides or currents, one coming from between the Isle of Wight and the adjacent rivers, and the other from the channel without that island. The danger is also increased by a bank of sand, called the Shambles, lying about four miles east by south from the point or Bill of Portland, and on which there is not above three or four fathoms water.

Ships coming from the westward, and intended for Portland-road, should be careful to sail within a musket-shot of the bill, and then keep pretty close to the land till they come before the castle, and there come to an anchor; but particular attention must be paid to the terrible rippling of the Race of Portland, which begins a little to the westward of the Bill, and extends almost to Peverel Point. The depth of water too in the Race is very uneven, in some places not above seven, in others ten, and in others fifteen fathoms.

But the great difficulty consists in weathering the Bill of Portland, when ships have not kept sufficiently to the southward, not considering the current carries the ships much nearer to the land than they would otherwise be. Two light-houses are erected on the Bill of Portland, as a direction to seamen during the night; but these, though of very great use, are not always sufficient to avoid the danger; many ships are embayed, and obliged to run ashore on the beach, where they are in general entirely lost.

The water rises upon this coast about fourteen feet in spring-tides, and eight feet in neap-tides.

Of the INHABITANTS of Dorsetshire.

The inhabitants of Dorsetshire were called by the Romans *Duratrigenes*, a British word, signifying a people who dwell by the water-side, being compounded of *Dour*, water, and *Trig*, an inhabitant. When the Saxons first settled themselves in this country, the people became the subjects of the West Saxon kings, who often resided at Corfe-castle; but these being driven out by the Danes, and the latter by the Normans, the inhabitants are compounded of all these people. They are open and generous, kind and hospitable to strangers, very communicative, and ready to gratify the curiosity of those who are desirous of knowing any particulars of their country. Superstition, which once greatly flourished here, is almost banished from the people, through the care taken by the gentry to withdraw the veil of ignorance, through which the torch of reason cast only a glimmering light for many ages. Free enquiry has banished bigotry, and genuine science the jargon of the schools. The merchants are very assiduous in trade, and the common people in manufactures, agriculture, and the breeding and feeding of sheep and cattle. At the same time, it gave us concern to see, that the vice of drinking to excess is not yet banished, and that the pernicious trade of smuggling flourishes too much on these coasts. They exchange

great quantities of their wool, some of the finest in the world, for the brandies and other commodities of France, to the great detriment of the fair trader, and the irreparable injury of debauching the manners of the lower class of people.

Curious PLANTS in Dorsetshire.

French Sea-wormwood, *Abinthium Seriphium Narbonense*, *Park*, found on the sea-coast near Abbotsbury.

Sheeps Sorrel, *Acetosa arvensis lanceolata*, *C. B.* found in many pasture-grounds near Dorchester.

Wood Sorrel, *Trifolium acetosum vulgare*, *C. B.* common in the woods near Cramborn.

Wild Basil, *Acinos minus seu vulgare*, *Park*. On the hills in the Island of Purbeck.

Sweet Flag, or Cane, *Calamus aromaticus*, *Park*. It grows in watery places; we found it in a watery meadow near Sturminster.

Agrimony, *Agrimonia*, found in plenty near Dorchester.

Hard Bastard-sponge, *Alcyonium spongiosum officinarum*, *J. B.* This sea-plant we found on the shore of the Isle of Portland.

Yellow Rattle, *Crista galli femina*, *J. B.* found in plenty in most of the upland pastures.

Red Rattle, *Pratenfis purpurea*, *C. B.* in most parts of the low pastures, particularly about Charmouth.

Purple Spurrey, *Sergula purpurea*, *J. B.* found in the barren parts of the Isle of Purbeck.

Bishop's Weed, *Ammi majus*, *C. B.* found about Dorchester and Corfe-castle.

Brook-lime, *Anagalis aquatica*, found in most of the small brooks and rills in Dorsetshire.

Water Angelica, *Angelica sylvestris major*, *C. B.* We found this plant in a watery meadow near Stalbridge.

Gout-weed, *Podagaria vulgaris*, *Park*, found in the woods near Cramborn.

Rest Harrow, *Anonis sive resta bovis*, *Ger.* found in plenty in waste-grounds in many parts of the county.

Kidney-vetch, *Vulnaria rustica*, *J. B.* found in the pastures near Sturminster Newton.

Wood-roof, *Asperula odorata*, *Park*, found in the woods near Cramborn.

Water-hemp Agrimony, *Cornabina aquatica, folio bipartito diviso*, *C. B.* found in the watery meadows near Blandford.

Bistork, or Snake-weed, *Bistorta major, rugosioribus foliis*, *C. B.* found in the moist meadows near Sherborn.

The lesser-branched Fern, *Filix ramosa minor*, *J. B.* This curious plant we found in a wood near Bimister.

Sea-cabbage, *Brassica marina*, found on Chefil beach in the isle of Portland.

Butchers-broom, *Ruscus sive Bruscus*, *Ger.* found plentifully in the Isle of Purbeck.

White Bryone, *Bryonia alba vulgaris*, *Park*, found near Sherborn.

Hare's Ear, *Auricula leporis umbella lutea*, *J. B.* Plentifully on the hills near Shaftesbury.

Strange Coltsfoot, *Cacalia folio rotundo incano*, *Park*, found in the woods near Cramborn.

Calamint, *Calamintha vulgaris officinarum*, *Ger.* found in shady places near Sherborn.

Water Calamint, *Mentha seu Calamintha aquatica*, *Ray*, found in watery meadows near Frampton.

Antique COINS, &c. found in Dorsetshire.

A great variety of Roman coins have been dug up at different times at Maiden Castle, and other places in the neighbourhood of Dorchester; some of silver, and others of copper, called by the country people King Dorn's pence, from a notion that one king Dorn was the founder of Dorchester, and that these pieces of money were coined by him. At Woodberry-hill a great number of Roman coins have been dug up, besides arms, swords, and other remains of that people.

This county sends twenty members to parliament, of which two are knights of the shire for the county, the rest are burgessees, of which Dorchester, Pool, Lime, Bridport, Shaftesbury, Wareham, and Corfe-castle, send two each, and the united corporation of Weymour and Melcomb-regis, four.

W I L T S H I R E.

THIS county is bounded on the west by Somersetshire, on the east by Berkshire and Hampshire, on the north by Gloucestershire, and on the south by Dorsetshire and part of Hampshire. It is forty miles in length from north to south, thirty in breadth from east to west, and one hundred and forty in circumference. It contains one city, twenty-four borough and market-towns, three hundred and four parishes, about twenty-eight thousand houses, and eight hundred and seventy-six thousand inhabitants.

R I V E R S.

The principal rivers are the Isis, or Thames, the upper and lower Avon, the Willy, the Bourne, and the Nadder.

The Isis, or Thames, has its rise in Gloucestershire, and flows through only a small part of Wiltshire. It enters this county near its source, and begins to be navigable for boats at Cricklade; but after running, in a serpentine manner, about four miles, it enters Gloucestershire at a village called Castle Eaton.

The Upper Avon rises about the middle of the county, near the Devizes, and runs southward to Salisbury, near which it is joined by the Nadder, the Willy, and the Bourne. After its junction with all these streams, it becomes a considerable river, and passes into Hampshire about a mile below Downton.

The Nadder rises near Over Dunhead, on the borders of Dorsetshire; and directing its course to the N. E. falls into the Willy at Wilton.

The Willy rises near Warmister, in the western part of this county, and running south-east, is joined by the Nadder at Wilton, and falls into the Upper Avon a little to the west of Salisbury.

The Bourne rises at Kallinghorne Kingston, and running south, falls into the Upper Avon, a little to the east of Salisbury.

The Lower Avon rises in Gloucestershire, and enters this county near Malmesbury, a considerable borough-town; thence it directs its course to the southward, passes by Chippenham, another borough-town; thence to Bradford, and passes into Somersetshire at Moncton Ferry.

Remarks on the INLAND NAVIGATION of Wiltshire.

The only rivers navigable in this county are a small part of the Isis, or Thames, and a few miles of the Upper Avon. The first we have already mentioned in our account of that river, and the second is not navigable above five miles. The navigation begins at its mouth, which is at Christ-church in Hampshire, and extended to within two miles of Salisbury; but the rapidity of the current would not, it seems, admit of continuing the navigation to that city. This difficulty might, however, be very easily surmounted, by digging a canal from the city to the place where the navigation terminates, by which, and the assistance of a very few locks, loaded barges might be brought to the city. A more particular account of the navigation of the Upper Avon will be given in our survey of Hampshire, in which county the greater part of the navigation lies.

The navigation of the Lower Avon might also be extended from Bath to Bradford, and even to Chippenham; by which means a communication by water would be opened with Bristol, to the great advantage of both the counties of Wilts and Somerset.

A I R A N D S O I L.

The air of Wiltshire is sweet and healthy, sharp upon the hills, but mild in the vallies, even during the winter.

The northern parts, called North Wiltshire, is full of pleasant eminences, and watered with rivulets. It was once covered with woods, which are in a great measure cut down. The soil is a strong clay, and in many parts produces excellent corn. The banks of the rivers afford beautiful chains of fruitful meadows, where great numbers of black cattle are constantly fed, while the downs afford pasture for innumerable flocks of sheep. The soil of the vales is very rich, and affords large quantities of corn.

H U S B A N D R Y of Wiltshire.

Most of the farms in this county are extremely large; two or three hundred pounds a year they reckon small; from that rent to one thousand pounds a year are common. The arable lands let generally at seven or eight shillings an acre, and the farmers have their share of what is called Salisbury Plain into the bargain. Many of these farmers have seven or eight hundred acres of arable land, and some never sow less than five hundred. The flocks of sheep they keep on the plain, are, perhaps, the greatest in England; they run in number from three and four hundred to three thousand: they fold them during the whole year, and shift the folds every night.

The particulars of a farm of five hundred pounds a year are: eighteen or twenty horses, and twenty men and boys all the year: they use three or four horses to a plough, and hardly finish an acre a day.

Their course of crops is, 1. fallow; 2. wheat; 3. barley; and then fallow again, unless hop-clover, rye-grass, or faint-foin, are thrown in; the latter they leave as long as it will last. Their preparation for wheat is three earths; they sow three bushels on an acre, and reap, in general, twenty bushels, of nine gallons to the bushel. They likewise plow thrice for barley, sow four bushels, and reckon three quarters a middling crop. When they sow oats, they plow but once, sow five bushels of seed, and gain, on an average, three quarters. They seldom plow more than once for pease, which they generally drill in rows, hoe them, and reckon two quarters and a half a middling crop. They sow a great many turnips, plow for them three times, hoe them twice, and use them for feeding their sheep. In some parts of the county, especially about East Lavington, is a sort of herbage, called Knot-grass, which they use in feeding hogs.

The general price of labour, during the winter, is ten-pence a day; in harvest, one shilling and eight-pence; reaping wheat, five shillings an acre; mowing of corn, ten-pence; and of grass, one shilling and eight-pence. A boy of seven or eight years old has two-pence a day.

In many parts of the county they denshire their land, which costs fifteen shillings an acre, and is, in general, successful.

Lucern is cultivated in some parts of this county, and where they use it for feeding horses green, answers extremely well. We observed great quantities of a dwarf kind of burnet between the Devizes and Salisbury, but could not learn that any of the farmers had cultivated that plant for feeding cattle.

Perhaps the finest sheep-walks in England may be seen in this county: the verdure is good, and the grass in general fine pasture, such as would turn to prodigious account, if converted to the purposes of tillage. What prodigious advantage might be made of Salisbury Plain!

In

In twenty miles we saw but one habitation, and that only a cottage. A very little reflection will be sufficient to convince every thinking man, that such a vast tract of uncultivated land is a public nuisance. This plain is as broad as it is long, besides many irregular breaks into the adjacent cultivated country: if we therefore calculate the area of a square of twenty-two miles, it will, doubtless, be under the truth. Now it has been shewn, that all the corn annually exported in plentiful years, would grow on such a square; but if, with proper deductions for fallow, grasses, &c. half that quantity only was produced, it would surely be a sufficient reason for cultivating it, as it would at once remove all the clamours against exportation, and greatly increase the population of this kingdom. By all the observations we were able to make, there does not seem to be a barren acre of land in all this extensive tract; for the soil is a fine light loam, yielding exceeding good grasses, and would bear as fine corn as any in the world. What an amazing improvement would it be, to cut this vast plain into farms, by inclosures of quick-hedges, regularly planted, together with such trees as are best suited to the soil. The country would then wear a very different aspect from what it does at present, without a hedge, a tree, or a hut, and inhabited only by a few shepherds, and their flocks.

They mend some of their poor lands with chalk, which is of the rich, fat, soapy kind, and lay about twenty waggon-loads upon an acre, which is a good improvement for twenty years.

The farmers in the neighbourhood of Salisbury seem to have very inadequate notions of manure, for they suffer large quantities of cinder-ashes and mortar-rubbish to lie there in large heaps. We were informed, they even refused to fetch it away, without being paid three-pence *per* load for their trouble, though at the same time they furnish the inns with straw, in exchange for their dung; when a little experience would have taught them, that one load of the former is worth two of the latter. We saw, however, several compost dunghills in this county, and were informed that many farmers were convinced of their utility.

MANUFACTURES, &c.

This county is famous for its manufacturing, dying, &c. all kinds of English broad-cloths, flannels, long-cloths, carpets, &c. by which a vast number of people are employed, to the great advantage of the kingdom in general, and of this county in particular. Vast quantities of wool grow here, and some corn is often exported.

CITY, BOROUGHS, MARKET TOWNS, &c.

We entered this county from Cramborn-chace, which borders on Salisbury Plain, and directed our course to Wilton, a borough town situated near the conflux of the river Nadder with the Willy, about three miles from Salisbury, and eighty-seven from London. In the Saxon times, it was the see of a bishop, founded by Edward the elder, about the year 908. It was also the shire-town, had twelve churches, and the great western road passing through it. The bishoprick was taken out of that of Sherborn, and its bishop resided sometimes here, and sometimes at Ramsbury. After the conquest, king Stephen placed a garrison here, to curb the incursions of the empress Maud's soldiers from Salisbury; but Robert earl of Gloucester drove out the garrison, and burnt the town. It, however, recovered itself, and would, perhaps, have again attained its former consequence, had not Wyvil, bishop of Salisbury, procured a grant from Edward III. to turn the great western road through that city; and on that grant being put in execution, the town gradually declined, so that it is now but a mean place, and has only one church.

It was incorporated by Henry VIII. and is governed by a mayor, a recorder, five aldermen, three capital burgeses, eleven common-councilmen, a town-clerk, a king's bailiff, and a mayor's serjeant. The county-

courts are generally held here, and the knights of the shire elected.

Wilton is famous for a carpet manufacture, in which there are about eighty journeymen employed, who earn from ten to twelve shillings a week.

But the glory of this place is the magnificent palace belonging to the earl of Pembroke, called Wilton-house, which is justly admired as one of the principal objects of curiosity in England.

It was originally a monastery, so that the disposition of the apartments is irregular, through necessity. The building, with regard to the seat, was begun in the reign of Henry VIII. and the great quadrangle finished in the reign of Edward VI. The porch was designed by Hans Holbein. The other parts, rebuilt by the first earl of Pembroke, were all designed by the famous Inigo Jones, and finished by him in the year 1640.

In the court, before the grand front of the house, stands a column of white Egyptian granite, out of the Arundel collection. The height of the shaft is thirteen feet and a half, and the diameter twenty-two inches. On the top of the column is a beautiful statue of Venus, cast from a model made at Rome, from the remaining pieces of the broken antique statue placed on this column before the temple of Venus Genetrix, by Julius Cæsar.

The column was never erected since it fell in the ruins of Old Rome, till set up here, with a Corinthian capital, and base of white marble, which makes the whole thirty-three feet high.

On the lower fillet of this column are five letters, which having the proper vowels supplied, make *ASTARTE*; the name by which Venus was worshipped among the ancient nations of the east.

In the front of the house, on each side of the entrance, are two statues of black marble, taken out of the ruins of a palace in Egypt, where the viceroys of Persia resided many years after Cambyfes returned to Persia from the conquest of Egypt. One of the statues is crowned with an ancient diadem; the other has a garment on his shoulders, of different coloured marble.

In the great gateway is a statue of Shakspeare by Scheemaker, in the same attitude with that in Westminster-abbey: but the lines on the scroll are different; these are cut of Macbeth:

Life's but a walking shadow; a poor player,
That struts and frets his hour upon the stage,
And then is heard no more!

In the middle of the inner court is a large pedestal, on which is a horse as big as life. In this pedestal are four niches, furnished with four statues; the first is that of Jupiter Ammon, not only with ram's horns, but also with a whole ram on his shoulders: it was taken out of a temple in Thrace, said to have been built by Sesostris. On the right hand is the father of Julius Cæsar, when governor of Egypt. The next is Plautina, the wife of Caracalla, dressed like Diana the huntress.

In the middle of the vestibule, which is adorned with thirteen ancient busts, is the statue of Apollo, out of the Justinian gallery. He appears with a most graceful air, in a resting posture, having hung his quiver upon a laurel.

In the dining-room are several beautiful figures, by eminent masters. On each side of the door is a capital picture; one by Tintoret, representing our Saviour washing St. Peter's feet, the other disciples being present; the other by Andrea Schiavone, representing Christ entering Jerusalem riding upon an ass. Over the door is a picture of still life by Labradore. Among the pictures round the room are, the Virgin Mary, with our Saviour in her lap; also St. Joseph, St. Peter, and the painter Andrew Squazzella; a boy gathering fruit, by Michael Angelo Paci di Campi; a winter-piece, with many figures, by Velvet Brughel; a summer-piece, with a multitude of figures, by Brughel; three angels coming to Abraham, by Pasqualini. The arch of the beaufet is supported by two porphyry pillars, brought by lord Arundel from Rome. Over the chimney-piece, which is by Inigo Jones;

Jones, are the busts of Solon, and the emperor Pertinax.

At the entrance of the drawing-room is an antique pavement, composed of four sorts of marble, of gradual lights and shadows, as if cubes stood upon a plane; found under some ruins at Luna, a Roman city about sixty miles east of Genoa.

In the drawing-room are several very beautiful pictures; among which are, four children, representing our Saviour, an angel, St. John, and a little girl. The angel is lifting a lamb to St. John, who has his left hand upon it, and in discourse with our Saviour, as they are all fitting close together. Behind our Saviour is a tree, and a vine growing upon it, with grapes thereon. The girl, perhaps a symbolical representation of the christian church, has hold of the vine with one hand, and in the other a bunch of grapes, which she is offering to our Saviour. This is allowed to be the best picture in England of the famous Rubens.

A whole length of Democritus laughing, very much esteemed. By Spagnolet.

Christ dead, surrounded by angels. Bufalmaco.

The harmony between sculpture and painting; a very fine piece. Romanelli.

Variety of fruits and vines, growing up a pomgranate-tree, and two gatherers of the vintage; one a young man, the other a young woman, as big as the life. The former looks down on the latter, while he is gathering some fruit for her: as he reaches up to the twig, his shirt slips down from one shoulder, and shows his skin there not to be tanned. Michael Angelo, the painter of this picture, was famous for travelling figures: of this kind there appears, at a distance, a man driving an ass. Sir Roberts Gere gave Michael Angelo's widow three hundred pistoles for this picture, which he would never part with.

The angel and young Tobias. The figures are fine, and the landscape part very beautiful. Adam Elsheimer.

A charity with three children. This picture was formerly in the collection of king Charles I. Guido.

A nativity on copper, neatly finished. Rubens.

The three kings, or wise men, presenting their offerings. In this piece, which is one of this painter's best colouring, there are several horses, and many other figures at different distances, with a glorious light breaking through the clouds, in which are a group of cherubims. Paolo Veronese.

The decollation of St. John, by Dobson. This painter is an honour to the English nation; the picture being so finely executed, and with such strong expression, that very few pieces of the Italians exceed it. Sir Peter Lely reckoned this piece the chief historical picture in his possession.

The assumption of the Virgin Mary. This is one of the first pictures painted by the immortal Raphael.

The angel as speaking to Tobias about the fish, which is swimming up to them. The dog is between Tobias's legs, barking at the fish. Procacino.

A landscape with figures dancing. Poelmbourg.

Our Saviour carrying the cross. Andrea del Sarto.

Some market-people. Crespi.

The virgin with Christ. Solari.

Hercules and Dejanira. Giovanni Montoano.

The virgin with Christ and Joseph. Fr. Imperiali.

The virgin teaching our Saviour to read. Guercino.

The river Tyber, Romulus and Remus sucking the wolf. Del Po.

A shepherd and shepherdes. Bloemart.

Bacchus and Ariadne.

BUSTOS on the Chimney-piece.

Libertas and Libera.

Over the Looking-glass.

The busto of Otho.

A porphyry table.

In the Great Hall, among a great variety of statues, bustos, and sarcophaguses, are the following:

Faustina, wife of Antoninus Pius, larger than the life; the drapery very good.

A Pantheon, having the symbols of three divinities, a cornucopia with fruit for Vertumnus; out of it, grapes for Bacchus; and a sea-fish for Neptune. The figure is a comely man in the prime of his strength and age, without any beard, and therefore is probably an Apollo, larger than the life.

One of the labours of Hercules. He is represented as turning the river Achelous, who is figured as an old man, his thighs end in snakes, to signify the winding of the river.

In a Niche. Antinous.

A busto of Marcus Aurelius, when Cæsar.

A busto of Portia, wife of Brutus. The picture of Brutus on her breast, a necklace about her neck, and a diadem on her head; being the only one known with a picture.

A Sarcophagus adorned in the front in alto relievo, two Cupids holding two festoons of fruits; over each festoon are two heads of the Heathen deities; under one of the festoons is a lion and an ox, under the other a goat and a cock.

Upon the foregoing tomb is Euterpe the muse, sitting with a flute, very fine sculpture. Cleomenes.

A busto of Didia Clara, daughter of Didius Julianus. Her right hand is holding up part of her cloathing; two little Cupids at the bottom of the busto.

The busto on the chimney-piece is of Thomas earl of Pembroke, who collected the antique marbles.

A busto of Nero. The shape of his left arm and hand seen through his robe, two little Cupids at the bottom of the busto.

A Sarcophagus. In the middle of the front is a circle, wherein is represented the half lengths of a man and a woman, for whom it may be supposed the tomb was made; the other part of the front is fluted work; at one end is a lion with a unicorn under him; at the other end a lion, with a wild boar under him; at the bottom, under the circle, are two masks, one of them bearded, the other having a veil upon the upper part.

A queen of the Amazons, beautiful, though in a war-like action, being on one knee, as under a horse, defending herself in battle. To illustrate the action, the sculptor has carved a horse's foot. Her buskin plainly shews the ancient shape and manner of fixing it. Cleomenes.

A busto of Lucilla, the wife of Elius, very fine sculpture.

In a Niche. Mercury.

A busto of Apollo.

Hercules, not long before he died. He leans ready to fall, and looks very sick, and Pæan his friend looks up at him very much concerned. The expression of the muscles anatomists greatly admire.

Silenus and Bacchus, a group, very fine.

Flora. This, and the foregoing one, (both of the Parian marble) were a present to the first Philip earl of Pembroke, by the duke of Tuscany, who, in king Charles the first's time, was in England, and resided at Wilton, with the said earl, three weeks.

The bustos of Lyfimachus, Lepidus, and Phocion.

A Sarcophagus adorned with a fine column of the Corinthian order at each end; in the middle is graved a double door, partly open, which confirms what ancient authors have said, that some were so made, that the soul might go out to the Elysian fields. At each end of the tomb is a griffin.

In the gallery of this hall are five suits of armour; that in the middle was William earl of Pembroke's, the other four and the parts of five more suits in the lower part of the hall were taken from the following noble persons, on the following occasion. This earl, in the reign of queen Mary, was captain-general of the English forces at the siege of St. Quintin, at which siege were taken prisoners the constable Montmorency, Montheron, his son, with the dukes of Montpensier and Longueville, Lewis of Gonzaga, (afterwards duke of Nevers) the marshal of St. Andre, admiral Coligny, (who was afterwards murdered in the massacre at Paris) and his brother, not to mention John de Bourbon, duke of Anguien, who was found dead among the slain. Here are also some of the weapons which were taken at the same time.

A picture

A picture of the above-mentioned earl of Pembroke, by Hans Holbein.

A picture of the last supper. Giorgione.

At the bottom of the Brown Stair-case are,

A colossal statue of Hercules. His action is to shew one of his labours; he looks with an air of satisfaction that he has compassed the taking of the golden apples, three of which he shews in one hand. This is not in a resting posture as that of Farnese.

The tomb of Aurelius Epaphroditus.

This monument is one of the finest and most instructive that hath been ever seen. The excellence of the work, and correctness of the design, would easily inform us it must be a piece of some Greek artist, even though the place where it was first discovered did not. It is a tomb near Athens, which was discovered by some travellers, who brought it over into France to present it to cardinal Richlieu.

The tomb is of white marble, six feet four inches long, and two feet broad, and about the same height, taking in the cover, which is about two inches and a half thick; the cover is raised about one foot higher before, and is adorned with some figures in bas-relief, which relate to the history represented below. The inner superficies of the tomb is plain, with a rising of about one inch in the place where the head of the deceased should rest.

This is the epitaph,

Θ. Κ. ΑΡΡΗΑΙΩ ΕΠΑΦΡΟΔΕΙΤΩ
ΣΥΜΒΙΩ ΑΝΤΩΝΙΑ ΒΑΔΕΡΙΑ ΕΘΗΚΕ.

That is, to the Gods the Manes. Antonia Valeria hath made this tomb for Aurelius Epaphroditus, her husband.

There stands upon this tomb a colossal bust of Alexander the Great, of the best Greek sculpture, Medusa's head is on the breast-plate, a lion's face appears on the helmet, which has a particular crest on it.

Under the tomb last mentioned is

A little statue of a crouched Bacchus.

A small tomb, supposed for children. There are two Cupids on the front, supporting a circle which projects; under the circle are two baskets lying sidewise with fruit in them; a lion at each basket, as going to devour the fruit; at the ends of the front are two more Cupids; they look very sorrowful, with one hand upon their breast, the other hand holding a torch with the lighted end downward: there is a griffin at each end of the tomb. A statue of Cupid lying asleep upon the afore-said tomb.

In the two windows of the Stair-case, and in four niches, (one on each side of the windows) are six statues.

In the first window is the statue of Livia, wife of Augustus, bigger than the life, sitting in a chair, one hand supported by a Patera, to shew that she was honoured as Pietas, in which character she is also seen on a medal, the drapery very natural.

In the niche on your left hand.

Saturn with a child smiling on his hands as it looks up at him.

In the niche on your right hand.

Bacchus clad with an intire skin, the head of which appears on his breast: his sandal is fixed in a manner differing from others.

In the other window.

The statue of Didia Clara, daughter to Julian, bigger than the life, sitting in a chair; she holds a senatorial roll in a genteel posture; the drapery of her cloathing very fine.

In the niche on your left hand.

A shepherd playing on the flute, admired for the action of his fingers, a goat standing by him.

In the other niche.

The foster-father of Paris, with the Phrygian bonnet and shepherd's coat of skins.

In the passage leading into the Billiard-room are,

The busto of Cleopatra, Alexander the Great's sister.

The statue of Diana: she has a crescent on her head,

holds part of a bow in her left hand, and takes an arrow with her right out of her quiver.

A statue of Ceres: a cornucopia in her right hand, in her left she holds ears of corn and a poppy; a very genteel figure and fine sculpture.

The busto of Mutidia, daughter of Marciana.

On the opposite Side.

The busto of Possidonius, preceptor to Cicero.

The statue of Andromeda chained to the rock.

The statue of Mercury, with all his three symbols, wings, Caduceus, and a purse in his hand held up; he has wings also at his heels, as well as at his head.

A statue of a boy: he is dancing and playing on music.

The busto of Heraclitus.

In the Window.

A square urn of the emperor Probus and his sister Claudia; their names are in a square in the center of the front; there are festoons at the sides of the inscription; over it is an eagle standing upon a festoon of fruits, from out of whose wings come two serpents; they are folded up in ringlets, with their heads directed towards the head of the eagle: at the bottom is a tripod, with a griffin on each side of it; at each angle of the front is a wreathed column; the angles next to the back part are fluted pilasters, between which and the columns is a laurel-tree; in the pediment of the cover are two birds, that hold in their bills the ends of a string which ties a wreath of laurel; on the top of the cover are, in alto-relievo, the emperor and his sister.

On the right hand of the window are the bustos of Ilocrates, Sulpitia Poeta in porphyry, Perius the poet, Seneca, and Pythagoras.

On the other Side.

Colatinus, fellow-consul with Brutus.

The Billiard Room.

The left hand, on a white marble table, three statues. Pomona sitting in a chair on a cushion.

A figure recumbent, leaning on a sea-dog, and representing the river Meander.

Hercules killing the serpents.

In the first Window.

The statue of Mark Anthony the orator, very much admired.

Bustos between the first Window and the second.

Tullia, daughter of Cicero.

Julia Domina, wife of Septimus Severus.

Alexander Severus.

In the middle Window.

The statue of Bacchus, very fine ancient sculpture, adorned in a particular manner with poppies: the poppies hang as a belt from both shoulders as low as the knees.

Bustos between this window and the next.

Galba, Geta, Lucius, Vitellius Pater.

In the third Window.

The statue of Venus, standing in a very genteel easy posture, holding a vase, which she has emptied, resting her elbow of that arm on a pillar.

On the other Side of the third Window.

The bustos of Nerva, Arfinoe the mother, and Cælius Calvus.

On a white marble table of the same length of that on the other side of the room, are three statues.

Hercules wrestling with Antæus.

A very fine Greek statue of a river, represented by a beautiful naiad sleeping on the bank, with a genteel turn of her body, the linen covering her very decently; 'tis a river in Egypt running into the Nile, because in the front an Ibis appears about the running water, which has seized a young crocodile.

A young Bacchus smiling, grapes growing up a tree.

On the Chimney-side, seven Bustos; they are,

Horace the consular, Drufilla, Ptolemy, brother of Cleopatra, Pallas, Ænobarbus, a priest of Cybele, Lyfias the orator.

Over the doors two Bustos.

A Greek Cupid with agate eyes.
Gryphina, daughter of Ptolomy Euergetes.

P I C T U R E S.

Sufanna and the two elders, by Guercino.
Fowls. Hundecouter.
The Virgin, our Saviour, St. John, a lamb and a dove. Gennari.
Country people, and several sorts of birds. Griffier.

In the White Marble Table Room are,

Four pictures in Crayons, (by Mr. Hoare of Bath.)
The first is of the Rev. Mr. Woodroffe of Winchester; the next is of Mrs. Wrettle, governante to the countess of Pembroke; the third is of Philip earl of Pembroke, born of Vandyke; the fourth is Sir Andrew Fountain.

Over Mr. Woodroffe, a nativity. Carlo Cignani.

Over the last a half length of St. John. Giacinto Brandi.

St. John, preaching in the Wilderness, containing twenty figures as big as the life. In it are the faces of Tintoret and Titian; it cost earl Philip six hundred pistoles. Palma.

Over Mrs. Wrettle, the Virgin, our Saviour, St. John and St. Catherine. Procacini.

Over the last, the Virgin and our Saviour. Il Frate.

In the Window is the

Statue of Isis. She has the flower of the Lotus on her head. She is in a position bending, and her whole legs and arms appear round, not as commonly in Egyptian statues, which were strait and formal, shewing only the feet. This was reckoned the oldest, and (by the Mazarine catalogue) the only one known with that improvement. It is a group, for she holds, betwixt her knees, Osiris, her husband, in a coffin open, in one of whose hands is a pastoral staff, crooked at the end as a shepherd's. In the other hand he has an instrument of discipline like a whip, the symbols of power to protect and punish. On his head is the ancientest diadem or mitre, being triple, yet not as the pope's crown, but rather like the mitre of bishops, only with three points instead of two at the top: Orus, her son, is about her neck. There are a great multitude of hieroglyphics quite round the bottom, and behind the statue.

Over Philip, earl of Pembroke, the money-changers and people with the doves in the temple. Feti.

Over the last, the Roman charity. Petro Dandeni.

Views of Covent-Garden and Lincoln's-Inn-Fields, as they were originally designed by Inigo Jones

Over Sir Andrew Fountain, a landscape with the angel, Hagar and Ishmael. Poussin.

Over the last, the Virgin, St. Ann, old Joseph and our Saviour, who is putting a ring on St. Catherine's finger. Julio Romano.

A friar and a nun. Aldegraeff.

The salutation of the angel to the Virgin. Fran. Dani.

A piece of still life, of fowls, and a young boar. Gabriele Salci.

St. Jerome. Borgiano.

Over the Doors.

The bustos of Hesiod and Phædra.

On an English alabaster table.

The statue of Cupid asleep.

A white marble table, ten feet eight inches long, four feet six inches wide, and four inches thick.

The Chapel Room.

Homer, Plato, Anacharis, (over a marble chimney-piece of Inigo Jones) Mary Fitz-William, countess of Pembroke, Socrates, Aristotle.

Dido, Terence, Vibius, Volufanus, a bifrons of Cecrops and his wife, in memory of instituting marriage; leaves of sea-weed on his beard, in memory of his coming by sea from Egypt.

M. Junius Brutus, Tiberius, Livy.

A bifrons, two young women, their countenances different, and so are their curled locks; one has a diadem, the other a triple contexture of her hair elegantly tied.

Plautilla, Sextus Pompey, Themistocles, Lucius Antonius, Annus Verus.

Over the first Door.

Curius Dentatus.

On the window in the chapel is painted

William earl of Pembroke, and his two sons. In another pannel is the countess of Pembroke, who was Ann Parr, sister to queen Catharine, the last wife to king Henry VIII. There is with her their daughter; whose name was Ann, married to Francis earl of Shrewsbury.

Over the door leading to the Cube-room.

The busto of Domitia.

Begin the pictures with those over the busto of Homer.

A nativity. By Giaco Triga.

Thirty of the chief reformers, by a disciple of Carlo Maratti.

The flight into Egypt. Ventura Salembeni.

The Virgin, our Saviour, St. John and an angel. Bernardino Gatti.

The head of an old man. Augustin Caracci.

The devil tempting our Saviour. Paris Alfano Perugia.

Christ in the manger. Calandrucchi.

Lot and his two daughters. Francesco Chini.

Two Cupids holding a third upon their hands as carrying him, another boy lying down by them. Sirani.

The Virgin, old Joseph, our Saviour and Elizabeth. Girolamo di Sermoneta.

On the window-side, begin on the left hand.

Five soldiers, two expressing great fury to tear Christ's coat, another is gravely interposing, as if he were persuading them to cast lots for its. Annibal Caracci.

Noah with his family and animals going into the ark. Bassano.

The Virgin, with our Saviour in her arms: Joseph is looking on them. Guercino.

When you enter the south front towards the garden (which whole front is a beautiful building of Inigo Jones) pass through the cube-room into the hunting-room, the last room at the western end of that front, and then begin from the bustos on your left hand.

Julia, incomparably fine Greek sculpture, and (as several others in this collection) of Parian marble. She was wife to Agrippa, and daughter of Scribonia, third wife to Augustus.

Antonia, wife of Drusus the elder. The linen of this bust is very natural.

Berenice the mother; her hair in a particular manner. Balbinus.

The next are two statues, then proceed on with the busts.

Faunus finely twisting his body, by looking down over his shoulder at his leopard. Cleomenes.

Cupid, when a man, breaking his bow after he had married Psyche. Cleomenes.

Plotina, wife of Trajan. Berenice the daughter.

Annia Faustina, third wife of Heliogabalus; very fine like that of Antonia.

Mago, the famous Carthaginian.

Titus, Faunus, Jupiter, Julia, daughter of Titus.

On a yellow antique marble table.

A group, Cupid and Ganymede: Ganymede is sitting and resting against the stump of a laurel. It is rare to see the distinct form of the seven pipes, as here expressed. Cupid is very attentively looking on and reaching his hand out toward the pipes, as if to instruct Ganymede how to play.

On the pannels of the wainscot are painted eighteen different sorts of hunting, by Tempesta junior.

BUSTOS in the Cube-room. *Begin on the left hand coming out of the hunting-room.*

Massinissa king of Numidia, with the African bonnet on his head, the upper parts of two dragons, and the head of Medusa on his breast-plate.

Aventinus, son of Hercules; the head of a lion's skin, making the covering for his head, and the two fore-paws tied in a knot upon his right shoulder; an elegant performance.

Iotape, wife to Antiochus Comagena.

On a porphyry table.

Apollonius Tyanæus, the head and bust of one piece of marble. It is very lively in the attitude; his arm is tucking his garment about him.

On a porphyry table.

Poppea, Nero's second wife; her right hand is holding up part of her garment.

Semiramis: at the bottom of the bust are two little Cupids.

Lucanus, the head and bust of marble, fine sculpture.

Cæsonia, the busto all of transparent alabaster, fourth wife of Caligula.

Augustus, of Parian marble.

On a jasper marble table are the following three objects:

A nuptial vase, representing the whole ceremony of a Greek wedding, from the beginning of the sacrifice to the washing of the bride's feet: it is very fine work.

The statue of Diana of Ephesus: the head, hands, and feet black, the rest white marble, as described by Pliny.

A Roman urn: variety of very fine work all round it, of figures, foliage, birds, &c.

Prusias king of Bythia, excellent sculpture, pairs with that of Augustus.

Metellus, no beard, by a very fine Greek sculptor; all of a piece down to the navel; the only one which shews the ornament of a chain, which is of very rich work: on his breast-plate is an elephant, a laurel quite round the outside of it, the consular medal with an elephant on the reverse, the head of that is bearded, supposed to be a divinity, with the name only of Metellus; the elephant is in memory of the victory he gained over Jugurtha, king of Numidia, upon which he obliged him to deliver up all his elephants to the Romans.

Messalina, fifth wife of Claudius, of hard saline marble; she has a confident air, agreeable to her character; the marble of her cloathing very naturally represents a fine striped silk.

Octavia, the first wife of Nero, of fine coloured marble, her head-dress also very fine, with leaves and ears of corn bound round upon her hair. This bust, and that of Poppea, are both very curious.

On a marble table (the produce of Mount Edgcomb) are the five following:

An ancient Greek triangular altar to Bacchus; on one side Silenus holds a torch inverted in his right hand, in his left a basket full of fruit; on another side is an attendant of Bacchus dancing with one foot up, and a Thyrsus in his right hand; in his left hand a bowl and the skin of a beast on his arm; on the other side is a Bacchus dancing in a long thin garment.

Upon this altar stands a little statue of Bacchus, with grapes and with the snake, the peculiar symbol of the Egyptian Bacchus, who invented medicine, and was said to be the Sun and Apollo.

An alto relievo of Pyrrhus, the son of Achilles; it is an oval, and has a splendid aspect as of a very large gem, the face is porphyry, which the cardinal Mazarine so much valued, as to finish his dress with a helmet of different coloured marble.

A square altar, each of the sides has a divinity, Jupiter, Mars, Diana, and Juno; this was one of those altars for a private room.

Upon this altar stands a little statue of an ancient priest with a Phrygian cap, sacrificing a hog to Isis.

Vespasian, Trajan, Tmolus, an ancient law-giver and founder of a colony in the time of Apollo, fine sculpture, and much adorned: this stands upon a grey granite table which belonged to a temple, and was for the sacrificing of lesser animals, as birds, &c. That the blood might not run over the edges, it has a remarkable channel, as big as to lay one's finger in, round the utmost edge of the four sides of the flat next the moulding, and in the middle of one of the channels is a hole for the blood to run through.

Claudius, Pyrrhus king of Epirus, with a noble air; it has a dragon on the helmet, and on his breast-plate there is a head with wings; it is like the head of a bat.

Begin the pictures with the two double half lengths, which are between the two last busts, then the two double half lengths on the other side of the door.

Mrs. Killigrew and Mrs. Morton, celebrated beauties, by Vandyke.

Mr. James Herbert and his wife. Sir Peter Lely.

The earl and countess of Bedford. Vandyke.

The countess of Pembroke (mother of earl Thomas) and her sister.

Henry earl of Pembroke, when about seventeen years of age.

William earl of Pembroke, elder brother to earl Thomas.

Lady Catherine, eldest daughter to earl Thomas, (was married to Sir Nicholas Morice) and her brother, Mr. Robert Herbert.

Thomas earl of Pembroke, when lord high admiral.

Our Saviour, and the woman of Samaria. Gioseppe Chiari.

The countess of Pembroke, first wife of earl Thomas.

The Virgin, our Saviour, and Joseph, reading; there are also several boys in different actions. Gennari.

In the Ceiling.

Dedalus and Icarus. Joseph Arpino.

On the bottom-panels of this room is painted the history of the countess of Pembroke's Arcadia, written by Sir Philip Sidney. By the brother of Signior Tommaso.

In the Great Room. The celebrated Family Piece.

This consists of ten whole lengths: the two principal figures (and these are sitting) are Philip earl of Pembroke and his lady; on the right hand stand their five sons, Charles lord Herbert, Philip (afterwards lord Herbert) William, James and John; on the left, their daughter Ann Sophia, and her husband Robert earl of Carnarvon; before them lady Mary, daughter of George duke of Buckingham, and wife to Charles lord Herbert; and above in the clouds are two sons and a daughter, who died young. This, and all the other pictures in this room, are by Vandyke.

On the right hand of the great picture, over a door, is an half length of king Charles the first; and on the left hand, over a door, an half length of his queen.

On the chimney side.

A whole length of William earl of Pembroke, lord steward.

A whole length of the first lady of the second earl Philip.

Three children of king Charles the first.

Whole lengths of the dutchess of Richmond, (first married to Charles lord Herbert) and Mrs. Gibson the dwarf.

A whole length of earl Philip, who is in the great picture.

Over a door.

A half length of the countess of Castlehaven.

Over another door.

A half length of the second earl Philip.

On the garden side.

A whole length of a daughter of the earl of Holland.

A whole length of the duke of Richmond.

The paintings in the ceiling represent several stories of Perseus. By Signior Tommaso.

Begin the busts on the left hand the chimney side.

Marcellus, the famous consul.

Drusus the elder, brother of Tiberius.

Lucius Verus Cæsar.

Marcus Brutus, of the best Greek sculpture.

Caius Cæsar, upon a green antique marble table.

Hadrian.

Upon the chimney-piece, two in copper.

One Commodus, the other Polemon.

Constantine the Great, of better work than was common in that age, as are also a few of his medals.

Lucius Cæsar, brother to Caius Cæsar, upon an agate table.

Julius Cæsar, oriental alabaster, noted as may be seen by what is said of it in Valetta's collection. The marble of the breast-plate is of the colour of steel.

Antinous;

Antinous; Sept. Severus; Horace, in porphyry, mentioned also in Valetta's collection. Fabretti, in his comment, gives good reasons for its being Horace.

Marcus Aurelius, Antoninus Pius.
Cicero, of touchstone, with the Cicer

The following busts on the garden side are all of white marble, and the terms upon which they stand are of coloured marbles.

Artemis or Diana; her hair tied behind her, not to hinder her shooting; the air of the whole bust is like the upper part of the celebrated statue of this goddess, and thought to be by the same sculptor. This (as several others) has in Greek letters, the Greek name on it.

Marcellus the younger; Cassandra, daughter of Priamus; she was a prophetess, and had a temple, and therefore wears a peculiar head-dress, with several bandages.

Bust of Martin Folkes, Esq; upon a red Egyptian granite table.

Ammonius, with a Greek inscription upon it.

Arfinoe the daughter, Germanicus, Coriolanus.

Buffo of Sir Andrew Fountain, upon a lapis Lazuli table.

Scipio Asiaticus, Caracalla, Vitellius, and Alcibiades.

The lobby between the great room and the king's bed-chamber.

Begin the pictures with that over the door, next the bed-chamber.

An old man with some sort of sweet-meat in a pot, which he sells to the children; there are six about him; an extraordinary pleasure appears in all their countenances. Fran. Hales.

There are four more pictures on the same side, begin at the lowest.

Some Dutch people playing at draughts, a woman by them cutting bread and butter for a boy who is saying grace. Egbert Hemskirk.

A young woman with a shock-dog. Correggio.

A piper. Giorgione.

A Madona. Carlo Dolci.

The side over against the window.

Neptune and Amphitrite, with several other figures. Luca Giordano.

Under the last are four pictures, begin on the right hand.

Bacchus, with a bowl in his left hand, his right arm resting on a vessel, an old man emptying a basket of grapes into a vat, a woman and boys with two baskets of fruit, by a scholar of Raphael.

Two pictures, composed of different sorts of marble, out of the duke of Florence's collection.

Christ in the Virgin's arms, St. John is kissing him, Joseph is looking on them. Sciadone.

Over the door, next to the great room.

Christ raising Lazarus from the dead. Seb. Ricci.

On the same side are four pictures, begin with the lowest.

King Richard II. &c. An elegant representation of the king (in his youth) at his devotion, painted on two tables. In one he is represented kneeling by his three patron saints, St. John Baptist, king Edmund, and king Edward the Confessor, having a crown on his head, clad in a robe adorned with white harts and broom-cods, in allusion to his mother's arms, and his own name of Plantagenista. Thus he is praying to the Virgin Mary with the infant in her arms (on the other table) surrounded with christian virtues, in the shape of angels, with collars of broom-cods about their necks, and white harts on their bosoms; one holding up a banner of the crosses before them, and on the ground are lillies and roses.

St. John Baptist holds a lamb in his left arm; king Edward the Confessor holds a ring between the thumb and fore-finger of his left hand; king Edmund holds an arrow in his left hand; all their right hands are directed to king Richard, as presenting him to our Saviour, who inclines himself in a very kind manner towards them. There are eleven angels represented, each of them having a wreath of white roses round their heads. The disposition of their countenances, and action of their hands, is designed to show that their attention is employed about

king Richard. On the glory round our Saviour's head you may see the cross represented in it, and round the extremity of the orb are small branches of thorns. On two brass plates on the bottom of the picture is engraved,

Invention of Painting in Oil, 1410.

This was painted before in the beginning of Richard II. 1377. Hollar engraved and dedicated it to king Charles I. and calls it Tabula Antiqua of king Richard II. with his three saints and patrons, St. John Baptist, and two kings, St. Edmund, and Edward the Confessor.

A half length of Titian, by himself.

A pair, ruins, landscapes and figures. Viviano.

On the Garden Side.

Buildings perspective, and figures. Seb. & Marco Ricci.

Under the last are three Pictures.

St. Sebastian shot with arrows. Benedetto Luti.

A nativity, by Jan Van Eyck, 1410.

Ruins and figures. Paolo Panini.

B U S T O S.

Begin at the door next the Great Room.

Marcus Modius; a very fine bust with a Greek inscription upon it. Asinius Pollio.

On a black and yellow-coloured marble table, an alto relievo of the present earl of Pembroke, when ten years old. Scheemaker.

Seneca, Sappho, with the bandage as deified, of the finest marble like ivory, the last perfection of Greek sculpture; white as at first making, because (with several here) found in a vault.

The King's Bed Chamber. Over the Chimney.

The half length of a gentleman, supposed to be prince Rupert. Vandyke.

On an antique marble table.

Marcus Aurelius on horseback, made at Athens, and so esteemed, that the sculptor was sent for to Rome, to make that which is there in copper as big as the life. The person is in the same posture, but this a Macedonian horse, small, and of marble: to prevent the breaking, cardinal Mazarine had one side cemented to a marble, which comes out at the bottom, squared as a pavement, on which the horse is as walking.

The Corner Room. Over the door next to the King's bed-chamber.

Narcissus seeing himself in the water. In this piece are seven Cupids in various actions. Pouffin.

On the same side are seven more pictures.

Andromache fainting on her hearing of the death of her husband Hector. Here are twenty-five figures. Primaticcio.

A man forcing a boy to take physic. Bambocci.

The head of Mieris. Himself.

Midas's judgment. Philippo Lauri.

A young woman holding a candle. Schalken.

Mars and Venus. Vanderwerfe.

St. Anthony. Correggio.

On the Chimney Side.

An herdsman with cattle, as big as the life. Rosa di Tivoli.

A carpet, and a large boar's head. Maltese.

The countess of Pembroke, and lord Herbert, afterwards earl of Pembroke, when very young. Mr. Hoare of Bath.

The Virgin, Joseph, Elizabeth, and Christ, who is putting a ring on St. Catherine's finger. Anguisciola.

Pyrrhus brought dead out of the temple. They are putting him into his chariot. Several figures appear in great surprize. Pietro Testa.

The Side next to the outer Court.

The discovery of Achilles. Salviati.

In the Arundel catalogue, it is said, that his lordship desired Rubens to paint for him a fine finished closet-picture, which is this piece, being on an old Flemish board, most beautifully coloured. There is a group at bottom of nine angels, all in different postures, as raising the cloud under the Virgin Mary. There are several pretty cherubims heads at the side and at the top. It fo

much

much pleased Rubens, that he said he would make a great picture after it, which he did at a church in a convent at Antwerp, where he has added apostles, as big as the life.

Belfazzar's feast. A multitude of figures. A great astonishment appears in all the company at the table. By Old Frank.

Judith putting Holofernes's head into a scrip, which is held open by her maid. Mantegna.

On the other Side of the Window, begin at the lowest.

Our Saviour about two years old, sitting on a stone, a lamb is standing by him and licking his hand, in which he holds a string, which is tied to the leg of a dove, which sits in a little open-worked basket. There are two other figures. The rays from the glory round our Saviour's head strike a fine light upon them. One of them has her hand upon the dove. Paola Matthei.

Christ from the cross, two boys holding up the arms, and the Virgin devoutly stretching out her hands. At a distance appear the three crosses, and a group of little figures with a horse. It was made for Henry II. king of France, which he gave to his mistress, Diana Valentinois, and therefore two Vs. are on a palat hung on one of the trees, and on the painted flat frame, in one corner are the arms of France, in another a monogram of the first letters of their names; the other two corners the emblems of Diana, three half moons in one; a quiver and bow in the other. Michael Angelo.

A Madona, very fine, with seven stars round her head. Carlo Maratti.

The Garden Side.

Bacchus on an altar in the wood, many figures about it celebrating his mysteries, and shewing a great spirit, in different postures. The light darts through the wood in a most agreeable manner. Salvator Rosa.

An assumption of the Virgin.

On the other Side of the Window.

Ceres standing with a most genteel air, holding up wheat. Given by the duke of Parma to the earl of Peterborough, when he conducted James the second's queen to England. Parmegiano.

Christ taken from the cross; ten other figures, with strong expressions of the solemnity. The Virgin has her right hand under our Saviour's head, as lifting him up, while Joseph of Arimathea (who is richly dressed) is wrapping the linen-cloth round him. Behind Joseph are two men; one of them has the superscription in his hand, and the crown of thorns upon his arm; the other is as talking to him, pointing with one hand to the Virgin, and the other towards Joseph. On the other side is St. John, with his hands folded together, and shews great concern. Mary Magdalene is wiping off the blood, and wrapping the linen round our Saviour's feet. Mary, the sister of the Virgin, is as speaking to Nicodemus, who is as giving directions about the spices. Behind them are two men, one holds the nails taken from the cross, the other holds the hammer and pinchers. Here is also the tomb shewn, and the people rolling the stone from the entrance of it, and mount Calvary, with bones and skulls scattered about where the crosses stand, with the view of the multitude returning into Jerusalem: at a distance a landscape, with rocks, &c. Albert Durer.

Three by the door, begin at the lowest.

Venus and the three Graces. Andrea Camassei.

The descent of the Holy Ghost. Salembeni.

The Virgin with Christ in her lap. Doffo da Ferrara.

Three by the Window.

Day represented by Apollo riding upon a cloud, drawn by four horses; Night represented by a figure with dark wings, and poppies round her head. By her are two owls flying. Solimene.

Christ taken from the cross. Figino.

Christ in the Virgin's lap, he holds St. John by the hand. Lorenzo Garbieri.

In the cieling, the conversion of St. Paul. St. Paul is struck from his horse, he and his company appear in great surprize. Luca Giordano.

On a table, whereon cards, &c. are represented, is the statue of Morpheus, the god of sleep, in black touchstone, his head wreathed with poppies, and a poppy in one hand.

In the Closet.

The Virgin with Christ about four years old, as big as the life, standing by her, a figure as graceful as Raphael Urbin. The Virgin is as talking to St. John. More backward, at her right side, is a woman with a child in her arms, both with graceful countenances. A little figure of a faint is praying at a distance in a corner of the landscape, and an angel in the clouds. By Andrea del Sarto.

The Virgin; our Saviour is resting his head and right hand on her bosom. Bloemart jun.

A landscape, cattle, and travellers, horses with packs. Berchem.

A shepherdess in a straw-hat, representing the princess Sophia. Gerard Honthorst.

A landscape with figures. Orizonte.

A Flemish school. The painter is Gonfales, commonly called the Little Vandyke.

St. Sebastian shot with arrows. Paolo Veronese.

Christ lying on straw in a manger. Vandyke.

The prodigal son going abroad. Wouerman.

Christ astride upon a lamb, is held by the Virgin, old Joseph is looking on and leaning on a staff. Francisco Penni.

The Virgin, with Christ in her lap. Raphael.

A landscape, with rocks, water, and three travellers. Bartolomeo.

The prodigal son returning home. Wouerman.

Magdalene, as a penitent, overlooking the vanities of the world. Below her are six boys, as Cupids; they are handling of jewels, &c. By a scholar of Guido.

The Virgin reading, with Christ in her lap. Albano.

A landscape, with a man carrying a fishing-net. Francesco Bolognese.

Over the door, Mary Magdalene. Titian.

On the bow-window and chimney-side.

The Virgin, holding Christ in her lap: St. John has led a lamb to him. Christ is looking at an angel below on the ground, gathering flowers: old Joseph is higher up, with an ass by him. Cantarini.

Our Saviour ascending, with the four emblems of the Evangelists at the bottom of the clouds: two angels are supporting his arms. Giulio Romano.

Apollo seaing of Marsyas. Piombo.

Two whole lengths of two kings of France, Francis II. and Charles IX. Fred. Zuccherio.

King Edward VI. Hans Holbein.

Christ kissing St. John, by Andrea Salaino, scholar of Leonardo da Vinci.

The women bringing the little children to Christ. Sebastian Bourdon.

Three children of king Henry VII. Arthur, prince of Wales, Henry, about three years old, (was afterwards king Henry VIII.) and Mary, who married the king of France. Hans Holbein, the father.

The Virgin and old Joseph teaching Christ to read. Bernardino Gatti.

The Virgin, with Christ in her lap; St. John has hold of his right foot with his right hand. Gio Bat. Vico.

The nativity. Pontorno.

Isaac blessing of Jacob. Lazarini.

The Virgin, with Christ leaning the back part of his head against her breast. He has a bird in his right hand. Crespi.

Christ in the Virgin's arms, the straw below; three angels are looking on. Carlo Maratti.

The Virgin, exceedingly fine, the veil painted with Ultra Marine. Maria di Fiori painted the flowers with which the Virgin is surrounded. Carlo Dolci.

Our Saviour taken from the cross; the Virgin shews great concern. There are three other figures by them, and angels in the clouds. Valerio Castelli.

The marriage of Joseph with the Virgin. August. Taffo.

The Holy Family; saints represented praying at the bottom of the picture. Pietro Petri.

In the cieling, the birth of Venus: she is rising out of the sea; the three Graces are attending her: there are also five Cupids in different actions. Lorenzino da Bologna.

On a table of black and yellow marble, whereon cards, &c. are represented, lyes

A statue of Cupid asleep.

In the inner Part of the Closet.

The flight into Egypt. Giovanini.

The nativity. Theodoro.

The circumcision of Christ. Paolo Fiorentino.

Abraham's steward putting the bracelets on Rebecca's hands at the well. Pietro Bambini.

A landscape. Claude Lorrain.

The Virgin holding our Saviour by his arms; St. John embracing him: old Joseph is reading. Ludovico Carracci.

The judgment of Paris. Rotenhamer.

Eight small bustos upon gilded mask trusses.

Tithonus, divinity of the morning.

Venus of Medici.

Bacchus, very beautiful work.

Crispina, wife of Commodus.

Fauna, (the female divinity of Faunus is very rare.)

A Pantheon of a peculiar marble, and in the old Termini way: it has the symbols of Ammon, Mavors, and Thoth.

Epicurus, valued by cardinal Mazarine, there being no other of him.

Achilles, adorned at the breast, having rams on his helmet: a young face, small, and very neat work.

This room is the east end of Inigo Jones's building, the whole of which is esteemed a very complete piece of architecture. From the windows of these apartments is the following view: The garden, or rather a beautiful lawn, planted with various trees. The river, which earl Henry much enlarged. The bridge, which the said earl built from Palladio's design. Between some fine large cedar trees, a fall of water by the Stable Bridge. A piazza (the front of the stables) by Inigo Jones. A wood in the park upon a hill, on which stands in one part, a thatch'd house; in another, an equestrian statue of Marcus Aurelius, upon an arch; the prospect on that side being terminated with the Plain or Downs, on which are the horse-races. The engine-house, with two ornamented fronts, one front towards the house, the other towards the park. The cold bath, and upon it a complete cast of the fine statue of Antinous at Rome. An arcade, the front of which was originally that of a grotto, by Inigo Jones. Not only the spire, but the whole west front of Salisbury cathedral. Clarendon park, and places adjacent.

At the bottom of the geometrical stair-case.

The urn of Horace; on one side of which is this inscription:

DM
HOR. FLACC. PIIS MAR.
PAMPH. MIN FA FECIT.

Diis Manibus Horatii Flacci, the other letters to fecit probably relate to the person who had the urn made; but they were defaced, and since mended, as they thought they saw the traces of former letters: the other part is the apotheosis of a lyric poet. There is a woman in a loose garment, holding a burning torch, as one of the muses: another holds a lyre in her left hand, and a volume in her right, which she offers to a third woman with large wings, representing Fame. Near them stands a great altar, adorned with a crown. In an obscure corner sits a figure with his head reclined, which some think may be Momus, or Zoilus. They are genteel figures, and elegantly clothed. It is basso-relievo.

In the Stone Hall.

A little statue of a boy, as darting himself to catch something on the ground.

A sarcophagus: in a round in the front is the busto of a man. It is remarkable, 1st, That the physiognomy by the sculptor is unfinished, as they purposely did, to show that man could not hit the likeness of the splendor they appeared in, after they were descended to the Elysium. 2dly, This has the ornaments of two cornucopias, to show the plenty of fruits, &c. which they enjoy in the Elysian fields. 3dly, The right hand appears, with the

two fingers farthest from the thumb depressed or debased, holding up the thumb and the two other fingers, as was the ancient custom when they saluted others, and wished them happiness, as he is here supposed to do at his dying. 4thly, This is also distinguished by a little rising in the bottom, at the head, to show that it was to lay in the body whole.

Upon this tomb is a Janus fixed on a term.

An alto relievo, six figures, Nereides, and Tritons, and an horse.

A basso-relievo, having an Inscriptio Boustropa, the writing in the successive lines going forward and backward; first from left to right, then from right to left, as they turn or guide oxen in the ploughing of lands. This was esteemed the most ancient way of writing, and proves the great antiquity of this marble.

The statue of Apollo, of the finest Greek sculpture: he stands in a very genteel posture, with the middle of the bow in his left hand. It was found entire in the earth near Ephesus, in which were mixed some minerals, which have given it a stain that makes it look like old ivory. His sandal is a fine representation of the ancient shape and manner of fixing it.

An alto relievo, four boys gathering and eating grapes.

The statue of Urania the muse, with her symbol cut on the plinth, with so reverend an air of old age, that cardinal Mazarine would not suffer any part of it to be mended.

A very large alto relievo, weighing about a tun and an half, that was a freeze in a Greek temple of Diana and Apollo: it represents the story of Niobe and her children, &c. Here are seven sons and seven daughters, supposed to be hunting in the heat; and being ill, the father, mother, &c. come out of the shade, in which they are, and save two of them. All the figures and trees, especially the horses on which the sons ride, are so high, as that the heads and necks stand off without touching the marble behind. The forest Cithæron in Bæotia, in which they are hunting, is finely represented; and at a distance, by some of the trees, Sylvanus, the divinity of the woods, sits looking on with a grave concern. Here are twenty figures; Sylvanus, and three old men, (the father, and two uncles or tutors) and two old women, (the mother, and a nurse or aunt); seven sons, seven daughters; also five horses. Two of the youngest sons are on foot, as are the daughters.

The statue of Sabina, wife of Hadrian: fine drapery.

An alto relievo, Faunus playing on two pipes.

The front of Meleager's tomb cut off from the rest, of fine Greek marble, with thirteen figures, besides a dog and the boar's head. The whole history is represented from the first quarrel about the boar's head, till the burning of the fatal brand, and the carrying of him away to be entombed.

An alto relievo, the story of the child stealing the meat from off the altar, through the idol's mouth.

A small statue of Meleager, very fine sculpture.

A large alto relievo of a vestal virgin.

An alto relievo, shewing the ancient manner of eating. Here Jupiter, attended by Pallas, is served by Hebe.

A small statue of Æsculapius.

In the passage between this room and the breakfast-room are some pictures, but not of any consequence.

Breakfast Room. Over the first door.

The port of Leghorn. Perspective.

On the right hand of the window.

A boy with a bird's nest. Anto. Amorosi.

Christ, with three of his disciples; and Mary, who is upon her knees, weeping, upon the account of her brother Lazarus being dead. Pietro Faccino.

On the other side of the window.

A lady Rockingham. By Sir Peter Lely.

On the left hand, within the screen.

Sir Charles Hotham.

Duke of Montague.

Barbara countess of Pembroke, (second wife to earl Thomas) with her daughter, lady Bab. Herbert.

Mary countess of Pembroke, last wife to earl Thomas.

Two naked figures, one in the river, the other on the bank. By Cervelli.

Cupid, in an angry manner, wrenching his bow from a boy who has hold of it. Taruffi of Bologna.

St. John baptizing our Saviour. Cafalasco.

A triumph of Rome. Carto Caldar.

The story of Telethusa with her daughter Iphis, &c. from Ovid, B. IX. Antonio Loti.

Cephalus and Procris. Waterloo.

Over the door leading into the Corner Room.

Seven boys playing at blindman's buff. Girolamo Donini.

In the Corner Room.

The siege of Pavia. Hans Holbein.

Our Saviour carrying his cross. Luca Congiagio.

The Virgin, with our Saviour in her lap: old Joseph is leaning on an altar, an angel undrawing a curtain. Timot. d'Urbino.

A nativity: at a distance the shepherds with the sheep; an angel in the clouds. Disnigio Calvart.

An antique picture from the temple of Juno: Juno is sitting by a temple: there are coming to her, Pallas, Hercules, Diana, Apollo, Ceres, and Vertumnus, all with their symbols in their hands.

Two sea-pieces, one a storm, the other a calm. Vande Velde.

The Piazza Navona in Rome. Caffano.

Two battle-pieces. Bourgognone.

Heroidas dancing before Herod. Alessandro Varotari.

In Crayon, a copy of the princess Sophia, by lady Diana Spencer, daughter to his grace the duke of Marlborough.

The offering after the flood. Tommaso Luini.

Tobias taking leave of his father and mother: the angel is with him. Guercino.

In the Front of the Chimney-piece is

An alto relievo of eight figures, besides a dog and a goat.

The Basso Relievo Room.

An old Greek Mosaic tessellated work, the pieces of marble of various colours, not only flat, but rising as the figures: it represents the garden of the Hesperides.

An alto relievo, Bacchus drunk upon an ass, held on by a man and a woman, a man leading the ass. There are thirteen figures besides the ass and a goat.

An alto relievo, a priestess bringing a sheep for a sacrifice. There are two altars; upon one there is a fire, on the other an idol.

An alto relievo, the story of Clælia.

An alto relievo, a rape of Neptune. Twelve figures, besides two horses.

An alto relievo, Silenus drunk; the boys binding his arms and legs with vine-twist. Ægle is painting his face with a mulberry. Sixteen figures, besides an ass.

A Greek relievo of the very finest work, an oriental alabaster. Eleven figures, besides a dog. Those on the foremost ground alto relievo: it is of Ulysses, who is gone into the cave to Calypso, where they are kneeling round a fire. The cave is within, a most beautiful ruin of architecture, which has a fine freeze of figures, several of which are on horses. The other figures are of Ulysses's attendants, and spectators, some of which are got upon the ruins.

An alto relievo, Curtius on horseback, leaping into the earth, which opens with a flame of fire. It is of the finest work, by a Greek sculptor.

An alto relievo, two Cupids; one looks angry at the other, whose bow he has broken, which makes the other whimper.

An alto relievo, Europa on the bull. There are four other figures.

An alto relievo, a rape of the Centaurs. Eight figures.

An alto relievo, Galatea riding on the sea in a shell drawn by two dolphins. There are three other figures.

A Greek alto relievo of very curious fine work. It is a female Victoria; she has a wreathed corona in each hand, which she holds over two captives bound at her feet. There are a great many weapons of war, with armour and ensigns, and a particular trumpet.

An alto relievo, a boy on a sea-horse, blowing on a shell-trumpet.

An alto relievo, Venus, and Cupid sucking. She is sitting under a large rich carved canopy. Mars is sitting by in rich accoutrements, by which we may distinctly see the antique manner of putting on all the parts, from the helmet to the very feet. There is a very particular emblem of a Cupid sitting, his wings, tail and feet, are like a cock. At the bottom are two doves billing, and a cat defending herself from a dog.

An alto relievo, Britannicus in porphyry.

A very high alto relievo of Marcus Aurelius and Faustina, as big as the life. This is upon a grey moorstone table.

An alto relievo, two Cupids, and four other boys at play.

An alto relievo of Britannicus's Junia.

An alto relievo, Ariadne and Theseus. There are two other figures, and two horses.

An alto relievo, Saturn crowning arts and sciences. Five figures.

An alto relievo, Jupiter and Juno. Six other figures bringing offerings.

An alto relievo, the three Graces.

An alto relievo, Diana with her favourite stag, and two dogs asleep.

An alto relievo, Endymion asleep, and Diana coming down to him.

An alto relievo, two figures, one representing painting, the other sculpture; very fine drapery.

A basso relievo, Apollo and Diana destroying of Niobe's children, by shooting arrows at them. There are twelve figures besides Apollo and Diana, and six horses. Very small neat work.

An alto relievo, Venus riding on the sea in a shell drawn by two dolphins, attended by two Cupids. Above in the clouds is her chariot with two doves.

An alto relievo, a Greek woman dancing a child upon her foot, in porphyry.

An alto relievo, Saturn, a small one, but very old, and of most beautiful work.

An alto relievo from a temple of Bacchus. By the work it appears to have been in the time of the best sculptors. What is remarkable is, that the Thyrsus or sceptre of Bacchus has here the addition of bunches of grapes. There is a vine shooting up from the bottom, which is of the very finest sculpture.

Here are four statues as big as the life, and four small ones.

Venus picking a thorn out of her foot. The turn of the body is inimitable, and the expression of pain in her countenance very fine.

Cleopatra with Cæsarion, her son by Julius Cæsar, sucking on her lap. Her seat is an Egyptian improvement for softness, and so as to sit higher or lower as they pleased. The bottom has a layer like short bolsters, the next over them cross the contrary way, and so on to the height which they would fit. Her posture is very natural, and her locks hang gracefully on her shoulders.

Venus holding a shell in her right hand; her left hand has hold of the tail of a dolphin.

Venus and Cupid. He is begging for his shaft of arrows.

The little ones are upon four terms.

Orpheus, with his symbol.

Calliope, one of the muses, with a roll in her hand: she invented epic or heroic poetry.

Apollo, with his three symbols, a harp, a quiver, and a serpent

Venus, with a dolphin at her foot.

Upon three little carved trusses, three heads, two in bronze, young faces; the other a Janus.

Upon a table stained with figures and landscapes, the statue of Venus asleep. It is about the bigness of the Hermaphrodite at Rome. It is a fine Greek sculpture, and appears much older than that, as is observed in the cardinal's catalogue.

In the Long Room.

St. Peter and the angel coming out of the prison. Stenwick.

An old woman reading with spectacles. Rembrandt.
 A concert of music. Nicolo del Abate.
 A Magdalen. Pietro Damini.
 A landscape. Salvator Rosa.
 Rape of Dejanira by Nessus the Centaur. Hercules is shooting at him. Carlo Cresti.
 A nativity. Taddeo and Fred. Zuccherò.
 St. Michael's church at Antwerp. Vanderheyden.
 A multitude of small figures. Casteels.
 Hercules killing the bull. Paolo Parolino.
 A battle. Lucatelli.
 Hercules's labours. Fran. Floris.
 Fish, and an old woman giving a cat some milk. The fish by Snyder.
 Achilles dragging Hector's body round the walls of Troy. A skirmish between the Trojans and Greeks. Polidoro Caravaggio.
 Weeds and flowers, butterflies and other insects, a snake and a lizard. Vroomans.
 A country family, a man and his wife, and two children, one of which is asleep in a cradle. Brawer.
 A Turkish seraglio, women and eunuchs. Otho Venius.
 Three of Diana's nymphs bathing; Acteon looking at them. Giosep. del Sole.
 Seven of Diana's nymphs bathing. Girolino Peschi.
 Four of Diana's nymphs bathing; Acteon looking at them. Sebastian Concha.

On the other side of the window.

Hagar and Ishmael; an angel in the clouds. Fran. Buzi.
 Jupiter, Cupid, and Psyche. Giosep. Arigoni.
In the little room there is a model of a seventy gun ship; and over the door next to the ship,
 Venus, Cupid, and a satyr. Luigi Garzi.
 A group of figures with very odd faces. Murillo.
 A landscape with figures, and Severus's arch. Claudi Ghisolfi.

The Bugle Room.

R E L I E V O S.

An old man like a Silenus; he is filling a basket with grapes.

A bull, with his head adorned with a mitre and fillets, the middle of his belly bound round with a ribband. He that sacrifices is naked, with his head laureated: he leads the bull with his right hand; the popa, or priest, follows behind, laureated likewise, and clothed from the navel to his knees: in his right hand is a sacrificing olla or pot, and in his left hand is the ax.

Two priests, or ministers of the priest, as going before the victim: one of them is playing upon two pipes, the other stands laureated, prepared to do his office, with an earthen-chalice or simpulum in his right hand, and a patera in his left.

Jupiter sits on the right hand of Juno, on Mount Olympus, with a thunder-bolt in his right hand, and embracing her with his left, who embraces him with her right hand, both naked to the navel. Before them is a fire blazing upon an altar, and a priest standing, shod, with a very long robe, and bare-headed, casting something into the fire.

Cleopatra, with the asp, in a covered vase: she is here represented as having it ready, but does not shew it.

The ornament of a pedestal belonging to a victor. It represents very particularly some of the ancient Greek games. Here are several peculiar circumstances: Neptune, as the judge, is the only figure sitting; Saturn stands behind. At the end of the relievo is a handsome piece of architecture, something higher than the heads of the persons, and is as a portico to terminate the end of their running. In it are Mars and Venus, minding each other only. Over them is a Cupid, who has in his hand a peculiar light, not long as a torch, but as a lamp in the palm of his hand. Two young men are running, supposed to have set out from the end where Neptune is, and one is almost got to the end terminated by the building; he has such a light in his hand as Cupid has. Antiquaries speak of the exercise of running in this manner with a light: the other young man, who is running after him, has an oar in his hand of the antique form. In the middle space of the place for the exercises, are two strong

made men with beards; they shew another sort of trial, not of motion, (as the young men) but of strength: one of their hands is tyed to the other's two hands. In this, it is supposed, they took turns, to try which could pull the other farthest after them.

Two of the lower ones, on the other side of the window, are of one subject; and from what is legible from the old Greek which is on them, it is thought they represent the ancient manner of taking leave of dying friends.

Two men, one of them standing, the other sitting; their right hands joined together, as bidding a happy adieu to each other.

A man and a woman in the same posture as the two men, the woman sitting

Silenus drunk upon an ass, held on by two figures: a boy is leading the ass, and blowing upon a bull's horn; another boy sitting against a tree, playing on a pipe; another boy has hold of the ass's tail. At some distance, Venus is layed down asleep. Cupid has hold of some part of her garment, to cover her therewith. Higher up, a boy is gathering apples from a tree. On the back ground is a group of four boys; one of them is sitting and playing on a pipe; another is playing on a timbrel; the other two are dancing.

Venus wringing the water out of her hair.

The head of Ramitacles, king of Thracia, as big as the life, in porphyry.

Two little statues.

Cupid, with a Phrygian bonnet on his head, and his hands tied behind him.

A boy holding up the golden apple in his right hand.

The Stone Room.

B U S T O S, &c.

Domitian.

Sesoftris. The head is of red Egyptian granite; the bust part is of the white Egyptian granite: the head is adorned with a tiara, after the Egyptian form, and has a peculiar liveliness: it was found amongst the pyramids. This stands upon a very ancient altar of Bacchus. Round it we may see the whole dress of his priest; also the thyrsus in one hand: he has a panther after him; also two priestesses going in procession round the altar.

Anacreon.

Sabina Tranquillina, wife of Gordian.

Maria Otacillia, wife of Philip.

Aspasia, she who taught Socrates rhetoric.

Julia Mamma, mother of Alexander Severus.

Lucilla, wife of Verus.

A very ancient consular chair, called Sella Curulis; the back is in three parts; the middle part is in shape of a term; on the top is a bifrons; the faces are of a young man and a young woman, as the genii of Rome. An iron goes through the shoulder part of the term, sloping gradually down about six inches, and is there fastened to the tops of the other two parts, which, as well as the term, are of brass, ornamented with silver; the two fore legs are iron; the seat is thick and broad.

The busto of Dollabella.

The statue of Manlia Scantilla, wife of Didius.

The busto of Octavia the elder.

The busto of Julia Mæsa, mother of Heliogabalus.

A table of red Egyptian granite.

The gardens are on the south side of the house, and extend themselves beyond the river, a branch of which runs through one part of them. Over this river is a fine bridge, built by the late earl of Pembroke, from a design of Palladio: on it is an open colonade of the Ionic order.

After passing this bridge, you ascend a fine sloping hill, the top of which is covered with a plantation; and in the center a summer-room, from whence there is a very beautiful prospect of Salisbury, and the north side of its cathedral.

On the south side of the gardens is the great park, which reaching beyond the vale, the view opens to the great down, generally called Salisbury-plain, and commands a most extensive prospect.

We have already observed, that this structure was formerly a religious house. It was originally an old church, dedicated

dedicated to St. Mary, in which Wulfstan, earl or duke of Wiltshire, about the year 773, placed a college or chauntry of secular priests; but his relict, St. Alburga; converted this college into a nunnery in the year 800. In 871, king Alfred having built a new nunnery here, removed hither the nuns of St. Mary. This new nunnery, which was of the Benedictine order, was first dedicated to St. Mary and St. Bartholomew, but afterwards to St. Edith. At the dissolution, it was endowed with a revenue of six hundred and one pounds, one shilling and a penny *per annum*.

Wilton sends two members to parliament, has a weekly market on Wednesday, and three annual fairs for the sale of sheep, viz. the fourth of May, the twelfth of September, and the thirteenth of November.

Salisbury, or New Sarum, which we next visited, is a clean, pleasant, and well built city, eighty-three miles from London. It is the see of a bishop, and owes its origin to a cathedral founded here in 1219, by bishop Poore, who removed hither from Old Sarum, and was followed by the greatest part of the citizens of that place. The ~~new~~ city now increased so fast, that it was incorporated by Henry III. and is now governed by a mayor, a high-steward, a recorder, a deputy-recorder, twenty-four aldermen, thirty common-councilmen, a town-clerk, and three serjeants at mace.

The city stands at the confluence of two rivers, the Avon and the Willy, each a considerable stream. It is situated in a valley; and the streets, which are broad and spacious, built at right angles; but what is more remarkable, and perhaps peculiar to this place, is a small transparent stream of water running through every street, and in several of them two streams, one on each side, instead of gutters. The market-place is large and spacious, having the town-house in the center, an elegant building, and the council-chamber, decorated with a very fine original picture of queen Anne, drawn by the celebrated Dahl.

The close adjacent to the cathedral, in which live the canons and prebendaries, is so large and well built, that it looks like a fine city of itself.

The cathedral church was begun by bishop Poore, (who also built Hornham bridge); the work was continued by Robert Bingham, and William of York, and finished by Giles de Bridport, bishop of this see; all in the space of forty years. It is built in the figure of a cross: above the roof, which is one hundred and sixteen feet to the top, rises the tower and spire, the finest and highest in England, being, from the ground to the top of the weathercock, four hundred and ten feet; and yet the walls so exceeding thin, that, at the upper part of the spire, upon a view made by the late Sir Christopher Wren, the wall was found to be less than five inches thick; upon which a consultation was had, whether the spire, or at least the upper part of it, should be taken down, it being supposed to have received some damage by the great storm in the year 1703, but it was resolved in the negative; and Sir Christopher ordered it to be strengthened with bands of iron plates, which have effectually secured it; so that some of the best architects say, it is stronger now than when it was first built.

The tower has sixteen lights, four on each side. Its ornaments are rich, and yet judiciously adapted to the whole body of the building. But the beauty of it is hurt by a thing very easily to be remedied, which is this: The glass in the several windows being very old, has contracted such a rust, that it is scarcely to be distinguished from the stone walls; consequently, it appears as if there were no lights at all in the tower, but only recesses in the stone: whereas, were the windows glazed with squares, and kept clean, (which might be done) they would be plainly visible at a distance; and not only so, but from all the adjacent hills, you would see the light quite through the tower each way, which would have a very fine effect.

They tell us here long stories of the great art used in laying the first foundation of this church, the ground being marshy and wet, occasioned by the channels of the rivers; that it was laid upon piles, according to some, and upon wool-packs, according to others; but this is

not to be believed by those who know, that the whole country is one rock of chalk, even from the top of the highest hills to the bottom of the deepest rivers. And the foundation of wool-packs is, no doubt, allegorical, and has respect to the woollen trade.

There are no vaults in the church, nor cellars in the whole city, by reason of springs: very frequently the water rises up in the graves that are dug in the church, and is sometimes two feet high in the chapter-house. Whether this is owing to springs, or to penning up the river Avon, and the currents in the streets, is uncertain; but the foundation of the church must be greatly impaired, and, in time, ruined by it. And if it proceeds from the oozing of water from the several adjacent streams, I should imagine, that digging a deep trench round the church-yard, and taking off so much of the surface, as to make a declivity each way to the trench, would at least keep the church dry, especially if the water drained into it were constantly thrown out by an engine. And this would be an expence very well bestowed, did it contribute, in any degree, to preserve the building.

In the outside of the church there is a beautiful simplicity and elegance; but the west end, though crowded with ornamental work, is not well designed: nor does the church deserve so much to be admired within, as without; though its inside is certainly hurt by the paltry old painting in and over the choir, and the white-washing lately done, wherein they, very stupidly, have every where drawn black lines, to imitate joints of stone.

It is the opinion of many, that this building is light and slender to a fault; as, on the contrary, the new part of the cathedral of Winchester is heavy and crowded; for though a building be strong, yet, if it have not the appearance of strength, it is as great a defect in its beauty as being over clumsy.

To give an instance of this; let any one view the arcade round Covent Garden, and the rustic arcade of the front of the Royal Exchange, and he will be convinced, that piers or pillars may be too slender, as well as too thick. But one would imagine, that the builder of Salisbury cathedral had been making experiments, to see what he could do, rather than what he ought to have done; for it is plain, his reason for building so slight could not proceed from any apprehension of the foundation failing; because, if so, he would not have thought of carrying up a steeple such a vast height.

The north-west of the four pillars which support the steeple, having bent towards the middle, was the reason, I suppose, of erecting the two lower arches, intersecting the great isles of the cross from north to south, to preserve the perpendicular level of that, and the other three pillars, as much as possible. But this is done in the Gothic manner, with so much beauty, that, were there no need of them, one would scarcely wish them away. How they let this building into the main pillars, and how they ventured to dig for a foundation, is worth the examination of architects.

The steeple, besides these arches, is likewise propped by stone supports, carried every way diagonally cross the open arcades, above the arches of the side-isses, and also cross the windows of the middle isle, and seem to have been done about two hundred years ago.

The ordinary boast of this building is contained in the following verses:

As many days as in one year there be,
So many windows in one church we see;
As many marble pillars there appear,
As there are hours throughout the fleeting year;
As many gates, as moons one year do view:
Strange tale to tell, yet not more strange than true!

If this be really so, and we are to suppose, that the designer had it in view when he formed his plan, it was a consideration so trifling and childish, that it calls for censure, much rather than approbation. Convenience for the intended purpose, strength, and then beauty, are the three things to be considered in all buildings, and happy is his genius who succeeds in them all. Would any person therefore (except a fantastical monk) cramp and hurt his plan, which unavoidably must be the case;

for such a ridiculous end as this? Surely no; we ought rather to impute this discovery to some cunning observer, who has found out what the architect never thought of.

The organ in the church is fixed over the entrance of the choir: it is very large, being twenty feet broad, and forty feet high, to the top of its ornaments. It has fifty stops, which are eighteen more than what are in the organ of St. Paul's: but the sweetness of the tone of St. Paul's organ is far beyond that of Salisbury, though the last is a very good instrument.

The church has been very lately repaired by the contributions of the bishop and prebendaries, set on foot by bishop Sherlock, who, it seems, thought that the dignitaries ought to support what supported them; and that all they got by the church, was not designed merely to make or enrich their families.

Some of the windows of the church, which escaped the fury of the zealots of 1641, are well painted.

There are some very fine monuments in this church; particularly in that they call the Virgin Mary's Chapel, behind the altar, is a noble monument for a late duke and dutchess of Somerset, with their portraits at full length. The late dutchess of Somerset, of the Piercy family, also her daughter the marchioness of Caermarthen, and a second son of her grace, both by duke Charles Seymour, are likewise interred here, as he himself is.

The figure of one Bennet is here represented, who, endeavouring to imitate our Saviour in fasting forty days and forty nights, carried his point so far, that being reduced to a skeleton, he fell a victim to his presumptuous and enthusiastic folly. The bodies of the bishops Jewell, Uvall, and Chest, were also interred here. Here is likewise a monument to the beneficent Dr. Seth Ward, bishop of this see, who founded (amongst other benefactions, which we shall take notice of in Hertfordshire) an handsome college for the widows of ten ministers, allowing to each fifteen pounds *per annum*, and which has been since obliged to Dr. Gilbert, bishop of this see.

They shew you also the monument of the lord Stourton, in the reign of Philip and Mary, which is made remarkable by a particular incident, as follows:

This lord Stourton being guilty of a murder, which was aggravated with very bad circumstances, could not obtain the usual grace of the crown, to be beheaded; but queen Mary positively ordered, that, like a common malefactor, he should die at the gallows. After he was executed, his friends desiring to have him buried at Salisbury, the bishop would not consent that he should be buried in the cathedral, unless, as a further mark of infamy, they would submit to this condition, viz. That the filken halter in which he was hanged should be placed over his grave in the church, as a monument of his crime; which was accordingly done, and there still hangs a wire where the halter used to hang, instead of it.

The putting this halter up here, was not so wonderful to me, as it was, that the posterity of that lord, who remained in good rank some time after, should never prevail to have that mark of infamy taken from the tomb of their ancestor.

The cloister is one hundred and sixty feet square, the inner cloister thirty feet wide, with ten arches on each side, the top vaulted, and covered with lead. Over the east walk of the cloister is a spacious library, but not over-well stocked with books. The chapter-house is octagon, and of fifty feet in diameter; the roof bearing all upon one small marble pillar in the center, which seems so feeble, that it is hardly to be imagined it can be a sufficient support to it.

Besides the cathedral, there are in this city three other churches, and three charity-schools, in which one hundred and seventy children are taught and clothed. Here is also an hospital or college, founded by bishop Ward in 1683, for ten widows of poor clergymen; and here are several large boarding-schools for young gentlemen and ladies.

The manufactures of this city are flannels, druggets,

and the cloths called Salisbury Whites. It is also famous for its manufactures of bone-lace and scissars, and may justly be considered as one of the most flourishing cities in England, that depends entirely on an inland trade.

In the year 1260, Egidius de Bridport, bishop of Salisbury, built in this city a college for scholars, which continued till the general suppression, when it consisted of a warden, four fellows, and two chaplains.

The parish church of St. Edmund, in this city, was made collegiate for a provost, and twelve secular canons, by Walter de Willy, bishop of Salisbury, some time before the year 1270. This college was valued, upon the dissolution, at one hundred and two pounds, five shillings and ten-pence *per annum*.

In the west suburb was a house of black friars, supposed to have been founded by Edward I.

Salisbury sends two members to parliament, has two weekly markets, held on Thursday and Saturday; and four annual fairs, viz. the Tuesday after the sixth of January, for cattle and woollen cloth; Monday before Old Lady-day, or the fifth of April, for broad and narrow woollen cloths; Whitfun Monday and Tuesday for pedlary and horses; and Tuesday after the tenth of October, for hops, onions, and cheese.

Old Sarum, or Salisbury, formerly a large city, stands about a mile to the northward of the city of Salisbury, and is so ancient, that it was a fortress of the ancient Romans, afterwards a Roman station; and in Antoninus's Itinerary, it is called Sorbiodunum, from an old British word, signifying a dry situation on a hill. Some of the later Roman emperors, particularly Severus, are said to have resided here. It was possessed by the Saxon king Kenric in the year 553, and in 960, king Edgar assembled a Saxon council here. It was plundered by king Swain the year after the Danish massacre; but in 1080, it was in so flourishing a condition, that the bishop's see was removed hither from Sherburn, and the second of its bishops built a cathedral here. William the Conqueror summoned all the states of the kingdom hither, to swear allegiance to him, and several of his successors often resided here. Henry I. in the year 1116, assembled here his lords spiritual and temporal, which some think gave rise to our parliaments. King Stephen, quarrelling with bishop Roger, seized his castle, and put a garrison in it, which was the first occasion of the ruin of this ancient city; for not long after, bishop Poor built a cathedral in the valley below it, and translated thither the episcopal see; and the citizens, often vexed at the insolence of the garrison, and, at the same time, labouring under great inconveniences for the want of water, on account of the height of their situation, removed to the new city. By degrees, Old Sarum was deserted, and is now reduced to a single farm-house, but is still called the Borough of Old Sarum, and sends two members to parliament, who are chosen by the proprietors of certain adjacent lands.

The city was situated on a high, steep, chalky hill, and the ruins of the castle are yet to be seen. It has a double intrenchment, with a deep ditch, to each. It is of an orbicular form, and has still a very august appearance, being erected on one of the most elegant plans for a fortress that can be imagined. In the north-west angle stood the cathedral, which, bishop Godwin says, was consecrated in an evil hour; for that the very next day, the steeple was set on fire by lightning, but was repaired by Osmund, the succeeding bishop. This was the prelate that composed the form of service called *Secundum Usum Sarum*, which they began in the year 1076, on the following occasion: Thurston, abbot of Glastonbury, who was brought from Normandy, and presented to that rich abbey by the above bishop Osmund, had a quarrel with his monks, by endeavouring to force them to use a new service composed by a monk of Normandy. The religious of Glastonbury refusing to comply with the desire of the abbot, he armed his servants, fell upon the monks in the choir, and drove them to the high altar, where they defended themselves with the forms and candlesticks, and two or three persons were killed in the fray. The king, on being informed of this outrage,

sent

sent the abbot back to Normandy, and dispersed the monks in other monasteries. Osmund, to prevent all future quarrels of that kind, composed the above service, which was afterwards received in most of the choirs of England, Ireland, and Wales.

During our stay in the city of Salisbury, we made several incursions into the adjacent country, to view the remains of antiquity, which abound in this county; but what is particularly remarkable, and which merits the attention of every traveller, is a famous temple of the ancient Druids, situated about eight miles to the north of Salisbury, and called

Stone-henge, which is considered as one of the wonders of the island. The learned have been at a great deal of pains about this piece of barbarous antiquity. In 1658, was published a treatise, called Stone-henge Restored, written by Inigo Jones, Esq; the famous architect, which was answered by Dr. Charlton. And in 1665, Mr. Webb, architect to king Charles I. who married Mr. Jones's daughter, published a vindication of his father-in-law. Mr. Sammes, in his Britannia, has a separate discourse on Stone-henge; and Mr. John Gibbons wrote upon the same subject; as did also Mr. Camden; and since him Mr. Aubrey, in a work intituled, Monumenta Britannica; but none so fully and clearly as Dr. Stukely, from whose learned dissertation lately published, intituled, "Stone-henge a Temple restored to the British Druids," we shall borrow the following account and description of it, referring to that elaborate performance itself (which well deserves the attention of the learned and curious) for the doctor's reasons for his hypothesis, which we think he has made out with as much certainty as the nature of the subject will admit.

The Wiltshire Downs, or Salisbury Plain, as this gentleman observes, is one of the most delightful spots in Britain; and Stone-henge, by the extravagant grandeur of the work, has attracted the admiration of all ages. Mr. Camden himself says of it, that he was grieved, that the founders of it could not be traced out. But Dr. Stukely has very happily made it more than probable, that it was a temple of the British Druids, and (the cathedral, as it may be called) the chief of all their temples in this island.

The stones of which it was composed are not factitious; for that would have been a greater wonder, than to bring them to the place where they are; but undoubtedly were brought fifteen or sixteen miles off, prodigious as they are, from those called the Grey Wethers, near Abury on Marlborough Downs, all the greater stones, except the altar, being of that sort; for that, being designed to resist fire, is of a still harder kind; 'tis a composition of crystals of red, green, and white colours, cemented by nature with opaque granules, of flinty or stony matter. The stone at the upper end of the cell, which is fallen down, and broken in half, the doctor tells us, weighs above forty tons, and would require above one hundred and forty oxen to draw it, and yet is not the heaviest stone neither. Judge then what a stupendous labour it was to bring together, so many miles, such a number as were used here; and this has induced many inconsiderate people to imagine, that the founders had an art of making stone, which has been lost for so many ages.

The present name is Saxon, though the work is beyond all comparison older, signifying a hanging rod or pole, *i. e.* a gallows, from the hanging parts, architraves, or rather impost; and pendulous rocks are still in Yorkshire called Henges. But the ancient name was most probably the Ambres; for which our learned author, to whom we refer, gives very satisfactory reasons; and hence the adjacent town of Ambresbury, which I have taken notice of, derives its name.

Stone-henge stands not upon the summit of a hill, but near it, however. At half a mile distance, the appearance is awful; but as you come up the avenue, in the north-east of it, which side is most perfect, the greatness of its contour fills the eye in an astonishing manner. It is inclosed in a circular ditch, which having passed, we

ascend thirty-five yards before we come at the work. The stones are chisselled, and far from rude, though not cut to that preciseness as the ruins in Old Rome: and the inside of them had more pains taken with them than the outside; for so, as our author observes, the polite architects of the eastern world were wont to do; not like our London builders, who carve every moulding, and crowd every ornament they borrow from books, on the outside of the public structures, that they may the more commodiously gather the dust and smoke:

When you enter the building, whether on foot or horseback, and cast your eyes around upon the yawning ruins, you are struck into an ecstatic reverie, which no one can describe, and they only can be sensible of who feel it. Other buildings fall by piece-meal, but here a single stone is a ruin. Yet is there as much undemolished as enables us sufficiently to recover its form when in its most perfect state. When we advance farther, the dark part of the ponderous imposts over our heads, the chasms of sky between the jambs of the cell, the odd construction of the whole, and the greatness of every part, surprise. If you look upon the perfect part, you fancy intire quarries mounted up into the air; if upon the rude havock below, you see, as it were, the bowels of a mountain turned inside out.

The whole work, being of a circular form, is about one hundred and eight feet in diameter, from out to out. The intention of the founders was this; the whole circle was to consist of thirty stones, each stone to be † four cubits broad, each interval two cubits; thirty times four cubits is twice sixty; thirty times two cubits is sixty; so that thrice sixty cubits completes a circle, whose diameter is sixty. A stone being four cubits broad, and two thick, is double the interval, which is a square of two cubits. Change the places between the stones and their intervals, and it will make a good ground-plot for a circular portico of Greek or Roman work. Though these bodies of stone, which are in the nature of imposts or cornices, never had, or were intended to have, any mouldings upon them, like Greek and Roman works, they are wrought perfectly plain, and suitable to the stones that support them; and the chisseling of the upright stones is only above ground; for the four or five feet in length below ground, is left in the original natural form. The upright stones are made very judiciously to diminish a little every way; so that at top they are but three cubits and a half broad, and so much nearer as to suffer their imposts to meet a little over the heads of the uprights, both within-side and without; by which means the uprights are less liable to fall or swerve.

It is to be feared some indiscreet people have been digging about the great entrance, with ridiculous hopes of finding treasure, and so have loosened the chalky foundation; for the upper edge of the impost overhangs no less than two feet seven inches, which is very considerable in a height of eighteen. The whole breadth at the foundation is but two feet and a half; and this noble front is now chiefly kept up by the masonry of the mortaise, and tenon of the imposts.

The contrivance of the founders, in making mortaises and tenons between the upright stones and the imposts, is admirable; but so contrary to any practice of the Romans, that it alone oversets their claim to the work. These tenons and mortaises of this outer circle are round, and fit one another very aptly. They are ten inches and one half in diameter, and resemble half an egg, rather than an hemisphere; and so effectually keep both uprights and imposts from luxation, that they must have been thrown down with great difficulty and labour. The whole height of upright and impost is ten cubits and an half; the upright, nine; the impost over the grand entrance is in its middle length eleven feet ten inches, and so is larger than the rest, and it is also a little broader, measuring on the inside.

Of the outer circle of Stone-henge, which in its perfection consisted of sixty stones, thirty uprights, and thirty imposts, there are seventeen uprights left standing,

† This cubit is the old Hebrew, Phœnician, or Egyptian cubit, and what the Founders of Stone-henge went by, and amounts to twenty Inches four-fifths English measure.

eleven of which remain continuous by the grand entrance, five imposts upon them. One upright, at the back of the temple, leans upon a stone of the inner circle. There are six more lying upon the ground, whole or in pieces, so that twenty-four out of thirty are still visible at the place. There is but one impost more in its proper place, and but two lying upon the ground, so that twenty-two are carried off. Hence our author infers, this temple was not defaced when christianity prevailed; but that some rude hands carried the stones away for other uses. So much for the larger circle of stones with imposts.

As to the lesser circle, which never had any imposts, it is somewhat more than eight feet from the inside of the outward one, and consists of forty lesser stones, forming, with the outward circles, as it were, a circular portico, a most beautiful work, and of a pretty effect; they are flat parallelograms, as those of the outer circle; and their general and designed proportion is two cubits, or two and an half, as suitable stones were found. They are a cubit thick, and four and one half high, which is more than seven feet; this was their stated proportion, being every way the half of the upper uprights. These stones are of a harder composition than the rest, the better to resist violence, as they are lesser, and they have sufficient fastenings in the ground. There are but nineteen of the forty left; but eleven of them are standing *in situ*, five in one place contiguous, three in another, two in another.

The walk between these two circles, which is three hundred feet in circumference, is very noble, and very delightful.

The Adytum, or cell, into which we may suppose none but the upper order of Druids were to enter, is composed of certain compages of stones, which our author calls Trilithons, because made each of two upright stones, with an impost at top, and there are manifestly five of these remaining, three of which are entire; two are ruined in some measure, but the stones remain *in situ*. It is a magnificent niche, twenty-seven cubits long, and as much broad, measuring in the widest place. The stones that compose it are really stupendous; their height, breadth, and thickness, are enormous; and to see so many of them placed together in a nice and critical figure, with exactness; to consider, as it were, not a pillar of one stone, but a whole wall, a side, an end of a temple, of one stone; to view them curiously; create such a motion in the mind, as words cannot express. One very remarkable particular in the constitution of this Adytum has escaped all observers before our author, which is this: As this part is composed of trilithons set two and two on each side, and one right before, they rise in height and beauty of the stones, from the lower end of the Adytum to the upper end. That is, the two hithermost trilithons corresponding, or those next the grand entrance, on the right hand, and on the left, are exceeded in height by the two next in order; and those are exceeded by that behind the altar, in the upper end of this choir; and their heights respectively are thirteen cubits, fourteen cubits, fifteen cubits.

The imposts of these are all of the same height, and ten cubits may be supposed their medium measure in length. The artifice of the tenons and mortaises of these trilithons and their imposts, what conformity they bear to that of the outer circle, is exceedingly pretty, every thing being done very geometrically, and as would best answer every purpose from plain and simple principles; and 'tis wonderful, that in the management of such prodigious stones as these are, fixed in the ground, and rammed in like posts, there is not more variation in the height, distance, &c.

Of these greater stones of the Adytum, as is observed before, there are none wanting, being all on the spot, ten uprights, and five cornices. The trilithon first on the left hand is in intire *in situ*, but vastly decayed, especially the cornice, in which such deep holes are corroded, that in some places the daws make their nests in them. The next trilithon on the left is intire, composed of three most beautiful stones. The cornice, happening to be of a very durable English marble, has not been much impaired by the weather. Our author took a walk

on the top of it, but thought it a frightful situation. The trilithon of the upper end was an extraordinary beauty; but probably, through the indiscretion of somebody digging between them and the altar, the noble impost is dislodged from its airy seat, and fallen upon the altar, where its huge bulk lies unfractured. The two uprights that supported it, are the most delicate stones of the whole work. They were, our author thinks, above thirty feet long, and well chiselled, finely tapered and proportioned in their dimensions. That southward is broken in two, lying upon the altar. The other still stands intire, but leans upon one of the stones of the inward oval; the root-end, or unhewn part of both, is raised somewhat above ground. The trilithon towards the west is intire, except that some of the end of the impost is fallen clean off, and all the upper edge is very much diminished by time. The last trilithon, on the right hand of the entrance into the Adytum, has suffered much. The outer upright, being the jamb of the entrance, is still standing; the other upright and impost are both fallen forwards into the Adytum, and broke each into three pieces, as supposed, from digging near it. That which is standing has a cavity in it, which two or three persons may fit in warm from the weather.

Stone-henge is composed of two circles and two ovals, respectively concentric. The stones that form these ovals rise in height as nearer the upper end of the Adytum, and their mediate measure in four cubits and four palms. They are of a much harder kind than the larger stones in the lesser circle; the founders no doubt intending, that their lesser bulk should be compensated by solidity. Of these there are only six remaining upright: the stumps of two are left on the south side by the altar; one lies behind the altar dug up, or thrown down, by the fall of the upright there. One or two were probably thrown down by the fall of the upright of the first trilithon on the right hand; a stump of another remains by the upright there still standing.

The whole number of stones may be thus computed: The great oval consists of ten uprights; the inner with the altar of twenty; the great circle of thirty; the inner of forty, which are one hundred upright stones; five imposts of the great oval; thirty of the great circle; the two stones on the bank of the area; the stone lying within the entrance of the area, and that standing without; there seems to be another lying on the ground, by the vallum of the court, directly opposite to the entrance of the avenue: all added together, make just one hundred and forty stones, the number of which Stone-henge, a whole temple, is composed. Behold the solution of the mighty problem! the magical spell, which has so long perplexed the vulgar, is broken! They think it an ominous, if not an impossible thing, to count the true number of the stones, and whoever does so, shall certainly die after it!

As to the altar, it is laid toward the upper end of the Adytum, at present flat on the ground, and squeezed into it, as it were, by the weight of the ruins upon it. 'Tis a kind of blue coarse marble, such as comes from Derbyshire, and is laid upon tombs in our churches and church yards. Our author believes its breadth is two cubits three palms, and that its first intended length was ten cubits, equal to the breadth of the trilithon, before which it lies. But it is very difficult to come at its true length. 'Tis twenty inches thick, a just cubit, and has been squared. It lies between the two centers, that of the compasses and that of the string; leaving a convenient space quite round it, no doubt as much as was necessary for this ministrantion.

The heads of oxen, deer, and other beasts, have been found upon digging in and about Stone-henge, undoubted reliques of sacrifices, together with wood-ashes. Mr. Camden says, mens bones have been found hereabouts; he means in the adjacent barrows; and such our author saw thrown out by the rabbits, which have been brought hither of late years, and by their burrowing, threaten these noble ruins, as the greedy plough more and more invades the neighbouring plain.

But, eternally, as he observes, is to be lamented the loss of that tablet of tin, which was found at this place in the

the time of Henry VIII. inscribed with many letters, but in so strange a character, that neither Sir Thomas Elliot, a learned antiquary, nor Mr. Lilly, first high master of St. Paul's school, could make any thing out of; and which, no doubt, was a memorial of the founders, written by the Druids; and, had it been preserved till now, would have been an invaluable curiosity.

In the year 1635, as they were plowing by the barrows about Normanton Ditch, they found so large a quantity of excellent pewter, as, at a low price, they fold for five pounds. There are several of these ditches, being very narrow, that run across the downs, which perhaps are boundaries of hundreds, parishes, &c. These pewter plates might very possibly have been tablets, with inscriptions; but falling into such rude hands, they could no more discern the writing than interpret it. No doubt, says Dr. Stukely, this was some of the old British Stanum, which the Tyrian Hercules, surnamed Melcarthus, first brought *ex Cassiteride Insula*, or Britain: which Hercules lived in Abraham's time, or soon after.

Mr. Webb tells us, the duke of Buckingham dug about Stone-henge, perhaps much to the prejudice of the work. Mr. Webb also did the like, and found what he imagined was the corner of a Thuribulum.

Mr. Hayward, late owner of Stone-henge, likewise dug about it, and found heads of oxen, and other beasts bones; and nothing else.

Dr. Stukely himself, in 1723, dug on the inside of the altar, about the middle, four feet along the edge of the stone, six feet forward toward the middle of the Adytum: at a foot deep he came to the solid chalk, mixed with flints, which had never been stirred. The altar was exactly a cubit thick, *i. e.* twenty inches four-fifths, but broken in two or three pieces by the ponderous masses of the imposts, and one upright stone of that trilithon, which stood at the upper end of the Adytum, being fallen upon it. Hence appears the commodiousness of the foundation for this huge work! They dug holes in the solid chalk, which would of itself keep up the stones as firm as if a wall was built round them; and no doubt but they rammed up the interstices with flints. But he says, he had too much regard to the work, to dig any where near the stones. He took up an ox's tooth above ground, without the Adytum, on the right hand of the lowermost trilithon northward.

The time our author assigns for the building of Stone-henge is not long after Cambyfes's invasion of Egypt; when he committed such horrid outrages there, and made such dismal havock with the priests and inhabitants in general, that they dispersed themselves to all the parts of the world; some as far as the East Indies, and some, it is not questioned, as far westward, into Britain; and introduced some of their learning, arts, and religion, among the Druids; and perhaps had a hand in this very work, the only one where the stones are chiselled; all other works of theirs being of rude stones, untouched of the tool, exactly after the Patriarchal and Jewish mode, and therefore older than this: and this conjecture is the more probable, because, at the time mentioned, the Phœnician trade was at its height, which afforded a readier conveyance hither: this was before the second temple of Jerusalem was built, before the Grecians had any history.

For farther particulars of this stupendous work, and other curious matters relating and adjacent to it, we must refer our readers to the work itself, having already exceeded the narrow bounds to which the nature of our design confines us. But this we may add, that doubtless they had some method in former days, in foreign countries, as well as here, to move heavier weights than we now find practicable. How else did Solomon's workmen build the battlement, or additional wall, to support the precipice of mount Moriah, on which the temple was erected; which was all built of Parian marble, each stone being forty cubits long, fourteen broad, and eight cubits thick? And so much for this celebrated temple of Stone-henge.

We shall now proceed to give some account of the famous barrows on these downs; and we shall borrow from the same learned author the following curious particulars relating to them.

The tops of all the hills, or rather easy elevations; round Stone-henge, are in a manner covered over with these barrows; which make an agreeable appearance; adorning the bare downs with their figures. This ring of barrows, however, reaches no farther, than till you lose sight of the temple, as we now make no doubt to call Stone-henge, or thereabouts. Many, from the great number of these sepulchral *tumuli* here, injudiciously conclude, that there have been great battles upon the plain, and that the slain are buried there; but they are really no other than family burying-places, set near this temple, for the same reason as we bury in churchyards and consecrated ground.

We may readily count fifty at a time in sight from the place, especially in the evening, when the sloping rays of the sun shine on the ground beyond them. They are most of them of a very elegant bell-like form, and done with great nicety: in general they are always upon elevated ground, and in sight of the temple, as we have said; for they all regard it, and are assuredly the single sepulchres of kings and great personages buried, during a considerable space of time, and in peace. There are many groups of them together, as if family burial-places; and the variety in them seems to indicate some pre-eminence in the persons interred. Most of them have little ditches around; in many is a circular ditch, sixty cubits in diameter, with a very small *tumulus* in the centre. Sixty, or even one hundred cubits, is a very common diameter in the large barrows. Often they are set in rows, and equidistant, so as to produce a regular and pretty appearance, and with some particular regard to the parts of the temple, the avenues, or the Cursus. Upon every range of hills, quite round Stone-henge; are successive groups of barrows for some miles; and even that named King-barrow, by lord Pembroke's park-wall at Wilton, which our author calls the tomb of Carvilius, is set within view of Stone-henge.

In 1722, the late lord Pembroke opened a barrow, in order to find the position of the body observed in those early days. He pitched upon one of the double barrows, where two are inclosed in one ditch. He made a section from the top to the bottom, an intire segment from centre to circumference. The composition was good earth quite through, except a coat of chalk of about two feet thick, covering it quite over, under the turf. Hence it appears, that the method of making these barrows was to dig up the turf for a great space round, till the barrow was brought to its intended bulk; then, with the chalk dug out of the environing ditch, they powdered it all over. And the notion of sanctity annexed to them forbade people trampling on them till perfectly settled and turfed over; whence the neatness of their form to this day. At the top or centre of this barrow, not above three feet under the surface, my lord found the skeleton of the interred, perfect, of a reasonable size, the head lying northward towards Stone-henge.

The year following, by my lord's order, Dr. Stukely opened another double barrow. He began upon the lesser, and made a large cut on the top from east to west. After the turf, he came to the layer of chalk, as before, then fine garden mould. About three feet below the surface, a layer of flints humouring the convexity of the barrow, which are gathered from the surface of the downs in some places, especially where it has been plowed. This being about a foot thick, rested on a layer of soft mould another foot, in which was inclosed an urn full of bones. The urn was of unbaked clay, of a dark reddish colour, crumbled into pieces. It had been rudely wrought with small mouldings round the verge, and other circular channels on the outside, with several indentions between, made with a pointed tool. The bones had been burnt, and crowded all together in a little heap, not so much as a hat-crown would contain; the collar-bone, and one side of the under-jaw, remaining very intire. It appears to have been a girl of about fourteen years old, by their bulk, and the great quantity of female ornaments mixed with the bones; as great numbers of glass beads of all sorts, and of divers colours, most yellow; one black; many single, many in long pieces, notched between; so as to resemble a string of beads, and these

were generally of a blue colour. There were many of amber, of all shapes and sizes, flat squares, long squares, round, oblong, little and great; likewise many of earth, of different shapes, magnitude, and colour; some little and white; many large and flattish, like a button, others like a pulley; but all had holes to run a string through, either through their diameter or sides: many of the button fort seemed to have been covered with metal, there being a rim worked in them, wherein to turn the edge of the covering. One of these was covered with a thin film of pure gold. These were the young lady's ornaments, and had all undergone fire, so that what would easily consume, fell to pieces as soon as handled; much of the amber burnt half through. This person was a heroine, for we found the head of her javelin in brass. At bottom are two holes for the pin that fastened it to the staff; besides, there was a sharp bodkin, round at one end, square at the other, where it went into the handle. Our author preserved whatever is permanent of these trinkets, but re-composed the ashes of the illustrious defunct, and covered them with earth, leaving visible marks at top of the barrow having been opened (to dissuade any other from again disturbing them): and this was his practice in all the rest.

He then opened the next barrow to it, inclosed in the same ditch, where lay, he supposed, the husband or father of this lady. At fourteen inches deep, the mould being mixed with chalk, he came to the intire skeleton of a man, the skull, and all the bones, exceedingly rotten and perished, through length of time; though this was a barrow of the latest sort, as he conjectured. The body lay N. and S. the head to the north, as that which lord Pembroke opened.

Next he went westward to a group of barrows, whence Stone-henge bears east-north-east. Here is a large barrow ditched about, but of an ancient make. On that side next Stone-henge are ten lesser, and, as it were, crowded together. South of the great one is another barrow, larger than those of the group, but not equaling the first: it would seem, that a man and his wife were buried in the two larger, and that in the rest were their children or dependents. One of the small ones, twenty cubits in diameter, he cut through, with a pit nine feet in diameter, to the surface of the natural chalk, in the center of the barrow, where was a little hole cut. A child's body, as it seems, had been burnt here, and covered up in that hole, but through length of time consumed. From three feet deep he found much wood-ashes, soft, and black as ink, some little bits of an urn, and black and red earth very rotten; some small lumps of earth red as vermilion; some flints burnt through; toward the bottom, a great quantity of ashes, and burnt bones. From this place he counted one hundred and twenty-eight barrows in sight.

Going from hence more southerly, is a circular dish-like cavity, sixty cubits in diameter, dug in the chalk, like a barrow reversed. 'Tis near a great barrow, the least of the south-western group. This cavity is seven feet deep in the middle, extremely well turned, and out of it, no doubt, the adjacent barrow is dug. The use of it seems to have been a place for sacrificing and feasting in memory of the dead, as was the ancient custom. 'Tis all overgrown with that pretty shrub *Erica Vulgaris*, then in flower, and smelling like honey. He made a large cross section in its centre, upon the cardinal points, and found nothing but a bit of red earthen pot.

He then dug up one of those he calls Druids barrows, a small tumulus, inclosed in a large circular ditch. Stone-henge bears hence north-east. He made a cross section ten feet each way, three feet broad over its centre upon the cardinal points. At length he found a squarish hole cut in the solid chalk, in the centre of the tumulus; it was three feet and an half, *i. e.* one cubit, pointing to Stone-henge directly. It was a cubit and an half deep from the surface. This was the *Domus exilis Plutonia*, covered with artificial earth, not above a foot thick from the surface. In this little grave he found all the burnt bones of a man, but no signs of an urn. The bank of the circular ditch is on the outside, and is twelve cubits broad. The ditch is six cubits broad (the Druid's staff);

the area is seventy cubits in diameter: the whole one hundred.

He opened another of these of like dimensions, next to that lord Pembroke first opened, south of Stone-henge; and found a burnt body in a hole in the chalk, as before.

In some other barrows he opened, were found large burnt bones of horses and dogs, along with human; also of other animals, seemingly of fowl, hares, boars, deers, goats, or the like; and in a great and very flat old-fashioned barrow, west from Stone-henge, among such matters, he found bits of red and blue marble, chippings of the stones of the temple, so that probably the interred was one of the builders. Homer tells us of Achilles slaying horses and dogs at the funeral of his friend Patroclus.

Lord Pembroke told the doctor of a brass sword dug up in a barrow here, which was sent to Oxford. In that very old barrow near Little Ambresbury, was found a very large brass weapon of twenty pounds weight, like a pole-ax, said to be given to colonel Wyndham. In the great long barrow farthest north from Stone-henge, which our author supposes to be an Archdruid's, was found one of those brass instruments called Celts, which he thinks belonged to the Druids, wherewith they cut off the mistleto. Mr. Stallard of Ambresbury gave it to lord Burlington, now in Sir Hans Sloane's cabinet, thirteen inches long. They dug a cell in a barrow east of Ambresbury, and it was inhabited for some time. There they saw all the bones of a horse. We find evidently, adds the doctor, these ancient nations had the custom of burning their dead bodies, probably before the name of Rome. So the lacrymatories we read of in scripture, are older than the Greek or Roman times.

About two miles from Stone-henge, and on the east side of the river Avon, lies Ambresbury, a place of great antiquity, eighty miles from London. It is said by some to have its name from Ambrosius Aurelianus, a Briton, who in the declension of the Roman empire assumed the government of this county, and founded here a monastery, which gave rise to the town. But others are of opinion, that the place is still more ancient, and derives its name from Ambres, supposed to be the original name of Stone-henge. The town has a handsome church, a charity-school, founded in 1715, for fifteen boys, and an equal number of girls; and several good inns, it being a thoroughfare for Warminster, Frome, Wells, &c. The place is remarkable for a small fish taken in the river, called a Loach, which travellers, &c. put into a glass of sack, and swallow alive.

The monastery, already mentioned, founded by Ambrosius, was filled with three hundred Benedictine monks, to pray for the souls of those noble Britons slain by the treachery of the perfidious Hengist the Saxon, who massacred here, in cold blood, three hundred of the British nobility, whom he had invited, with their king Vortigern, to meet him there without arms, in order to conclude a treaty of friendship, and rejoice together. The perfidious Saxon saved none but the king, whom he obliged to give him great part of his kingdom, before he would set him at liberty. About the year 280, Elfrida, repenting of the murder of her son-in-law, king Edward, surnamed the Martyr, converted the monastery into a nunnery, and dedicated it to St. Mary and St. Meliorus. In the year 1117, the abbess and thirty nuns were expelled for their incontinence, and dispersed into other religious houses, to be kept under strict discipline; and king Henry II. placed here a prioress and twenty-four nuns, from Ebroult in Normandy, to which this house was for some time subject; but it was at length made denizon, and once more became a nunnery of great repute. Eleanor, queen to Henry III. retired hither, where she spent the remainder of her days. In the year 1285, Mary, daughter to Edward I. and thirteen noblemen's daughters, supposed to have been influenced by the queen's example, took the veil here together in this house, which, at the general dissolution, was valued at four hundred and ninety-five pounds, fifteen shillings and two-pence *per annum*.

Here

Here is a weekly market on Friday, and four annual fairs, viz. the seventeenth of May, the twenty-second of June, the sixth of October, and the first Wednesday after the twelfth of December, for horses, sheep, pigs, and horned cattle.

Here is a feat belonging to the duke of Queensbury, built by Inigo Jones, but not greatly admired. Great improvements have, however, been lately made in the gardens, through great part of which the river Avon flows in beautiful meanders.

From Amersbury we returned back to the city of Salisbury, whence we went to view the ancient house and seat of Clarendon, about two miles from the above city. It stands in a large and beautiful park, the most commodious of any we have seen for breeding and keeping deer. King John built a palace here; and in the reign of Henry II. about the year 1164, a synod was held here, occasioned by the insolence and tyranny of Becket, archbishop of Canterbury; and hither the king and peers came, to witness to the bishop's swearing to a declaration which Henry had drawn up by way of recognition of the customs and prerogatives of the kings of England, which Becket had flagrantly invaded. These articles were, from the place where they were sworn to, called the Constitutions of Clarendon. Henry II. called another council here in the tenth year of his reign; but the barons and commons did not appear, either from some disgust they had taken at the king, on account of his minions, Gaveston and the Spencers; or on account of a plague and famine, which some historians say, raged at that time in this country. In this park, besides the palace above mentioned, there was another structure, called the Queen's Manor, or Lodge, which is still in being, as well as some parts of the King's, though they have for several years been pulling it down. There is a subterraneous passage between the lodges of the king and queen. The park is remarkably beautiful, and has in it twenty groves, each of them a mile in circumference. Some are of opinion, that this place should be called Clarendon, from a remarkable Roman camp half a mile distant, either made or repaired by Chlorus, father of Constantine the great. It is a beautiful fortification of a circular figure, situated on a dry chalky hill. Within is another circular ditch, supposed to have been a smaller camp for the summer.

About three miles to the southward of Clarendon Park, is the borough of Downton, pleasantly situated on the banks of the river Avon, eighty-four miles from London. It is an ancient borough by prescription, and governed by a mayor, chosen yearly at the court-leet of the lord of the manor, under the bishop of Winchester. This place was the seat of the hero Bevois of Southampton. The town sends two members to parliament, has a weekly market on Friday, and two annual fairs, held on the twentieth of April, and the second of October, for sheep and horses.

About three miles to the north-west of Downton, is Longford, the seat of lord Folkestone. It is situated in a pleasant valley, through which the Avon flows. The house, built in the reign of king James I. is in a triangular form, with round towers at each corner, in which are the library, dining-room, and chapel. The rooms, though not remarkably large, are very pleasant, cheerful, and elegantly decorated in the modern taste. The gallery is very fine, and contains some elegant pictures of the greatest masters. At each end of the gallery is a landscape, one representing a rising, and the other a setting sun: they are both by the famous Claud Lorrain, and esteemed two of the best pieces now in the kingdom, of that great master.

The pictures, furniture, and fitting-up of this gallery, are said to have cost ten thousand pounds.

The triangular form of the house is very singular, there being only one more of the same form in England, and this was built by the same artist, and stands about six miles from lord Folkestone's.

Leaving Longford, we continued our journey along the famous plain, near the borders of Dorsetshire, and visited Wardour-castle, a seat belonging to the Arundel family. In the civil war, this castle was attacked by

thirteen hundred men of the parliament army, and bravely defended by the countess of Arundel, who had only twenty-five men in the castle. But notwithstanding this disparity of numbers, she held out for a week, and then capitulated upon very honourable terms, which were so far from being kept, that she and her children were imprisoned, and the house and parks damaged to the value of fifteen thousand pounds.

Warminster was the next place we visited. It is a very ancient town, situated on the Deverel, ninety-nine miles from London, and had formerly great privileges, with exemption from tax or tribute. It is a populous place, furnished with very good inns, and was once very famous for its corn-market, which is still considerable. It has the greatest trade of malt of any town in the west of England; also a considerable trade in cheese, wool, and cloth. It has a weekly market on Saturday, and three annual fairs, viz. the eleventh of April, the tenth of August, and the twenty-eighth of October, for black cattle, sheep, swine, and cheese.

On the downs to the eastward of the town are two camps, one called Battlebury, which, from its double works, is thought to be Danish; and the other Scratchbury, which is a square fortification, with only a single trench.

A little to the west of Warminster is a lofty eminence called Clay-hill, which may be seen for many miles round the country. It is very steep on every side, and on the summit is a hillock, which, at a distance, resembles the crown of a man's hat. This hill is visited by all the young people in the neighbourhood, every Palm Sunday, provided the weather be fair, but for what reason is not now known, though the custom, in all probability, owed its origin to some superstitious fable introduced by the monks.

At the foot of Clay-hill is a fine seat belonging to lord Weymouth. It was begun by Sir John Thynne in the year 1567, but he died before it was completed. It is now a very noble structure, and the gardens very delightful. Here was formerly a small priory of black canons, founded by Sir John Vernon, and dedicated to St. Radegund. In the twentieth year of Henry VIII. it was annexed to the Carthusian priory of Hendon in Somersetshire.

Heightsbury, Heytsbury, or Hatchbury, is situated on the river Willy, near Warminster, ninety-nine miles from London. It was formerly a seat of the empress Maud, is an ancient borough by prescription, is governed by a bailiff and burgesses, and has a collegiate church, with four prebendaries, and a free school. It has no weekly market, but two annual fairs, the first held on the fourteenth of May, for black cattle, sheep, and toys; and the second on the twenty-fifth of September, for toys only.

Bradford, which was the next town we visited, is situated on the Lower Avon, over which it has a stone-bridge, ninety-eight miles from London. It was anciently called Bradenford, from a broad ford then over the Avon, where the bridge now stands. It is a populous town, and has a large manufacture of broad-cloth. A bloody battle was fought here between Kenelwachus, king of the West Saxons, and his kinsman Cuthred. Adhelm built a monastery here about the year 705, and dedicated it to St. Laurence. In the year 1001, king Etheldred gave it to the nunnery of Shaftesbury, in Dorsetshire, but the structure was afterwards totally destroyed by the Danes. In the tenth century, a synod was held here, in which St. Dunstan was elected bishop of Worcester. Here is a weekly market on Monday, and a yearly fair on Trinity Monday, for the sale of cattle and millinery goods.

About two miles to the north-east of Bradford is a small village, called Holt, where a medicinal water was discovered in the year 1718, which is in great repute for the cure of scorbutic and scrophulous distempers.

About two miles to the south-east of Bradford is Trowbridge, another large manufacturing town. It stands on the river Were, over which it hath a good stone-bridge, ninety-seven miles from London. Here is a large manufacture of broad-cloth, especially of the finer sort, mixed with

with Spanish wool. The court of the dutchy of Lancaster for this county is held here annually about Michaelmas. On the south side of the town was formerly a castle, the ruins of which, Mr. Camden tells us, were to be seen in his time, but there are now no vestiges of it remaining. Here is a weekly market on Saturday, and a yearly fair, on the twenty-fifth of July, for millinery goods.

Five miles to the southward of Trowbridge, is Westbury, so called from its situation on the western borders of the county, near the river Were, ninety-five miles from London. It was incorporated by king Henry IV. and is governed by a mayor, and twelve aldermen or burgeses. It is supposed to have derived its origin from a Roman station about half a mile to the northward, and formerly enjoyed as great privileges as the city of Bristol. It has a spacious church, and a considerable manufacture of coarse broad-cloth. It has sent representatives to parliament ever since the twenty-seventh year of the reign of Henry VI. The members are chosen by the corporation and burgage-holders, which amount to about fifty in number, and returned by the mayor. The market, which is a very good one for corn, is held on Friday; besides which, there is an annual fair on the sixth of November, for the sale of hogs.

A little to the west of this town, at a place called Bratton-castle, are the traces of a camp, surrounded by two ditches, where the Danes defended themselves fourteen days, after their defeat by Alfred.

Mere is a small market-town, situated in an angle of this county, bordering on Somersetshire and Dorsetshire, one hundred and two miles from London. It is a considerable staple for wool, and has a small manufacture of coarse broad-cloth. It has a weekly market on Saturday, and three annual fairs for the sale of cattle, pigs, cheese, and pedlary ware, held on the sixth of May, the twenty-fourth of August, and the twenty-ninth of September.

Seven miles to the eastward of Mere, is Hendon, a small borough-town, ninety-four miles from London. It is a great thoroughfare from London to the south of Somersetshire; is governed by a bailiff and burgeses, sends two members to parliament, and has a manufacture of fine twill. It has a weekly market on Thursday, and two annual fairs, viz. Monday before Whitsunday, and the eighteenth of October, for black cattle, sheep, horses, swine, and cheese.

Chippenham is a large, populous, well-built town, situated on the river Avon, over which it has a bridge of sixteen arches, ninety-four miles from London. It was incorporated by queen Mary, and is governed by a bailiff and twelve burgeses. King Alfred, and several of the West Saxon kings, often resided here. The church is elegant and capacious, said to have been erected, or at least beautified, by one of the Hungerford family, who also built a chapel, in which he founded a chantry, by licence from Henry VI. and which is still called Hungerford's Chapel. A charity-school for twenty-four boys was opened here in the year 1713; and at Westmead, in the neighbourhood, are frequent horse-races. It stands in the high-road between London and Bristol, and has a considerable manufacture of cloth. It sends two members to parliament, has a large market on Saturday, and three annual fairs, held on the sixth of May, the eleventh of June, the eighteenth of October, and the thirtieth of November, for horned cattle, sheep, hogs, and horses.

In the neighbourhood of this town is a village called Cosham, remarkable for its healthy situation, it being very common to find many of the inhabitants eighty, ninety, or even an hundred years old; and not many years since, ten persons of this place, whose ages together amounted to upwards of a thousand years, danced a morris at a gentleman's house in the neighbourhood. In the time of Henry II. there was here an alien priory of Benedictine monks.

At Lekeham, which lies a little to the south of Chippenham, many Roman coins have been dug up; and in a field near Lacock, something further to the south, those coins have been found in such numbers, that the place was called Silver-field.

At West Kingston, north-west of Chippenham, there is a camp with a single ditch, supposed to be Roman; and at Burywood, west of Chippenham, is a camp fortified with a double intrenchment.

At Lokeswell, near Chippenham, Henry, son to the duke of Normandy, afterwards Henry II. founded, in the year 1151, a convent of Cistercian monks, subject to the monastery of Quarrer, in the Isle of Wight; but three years afterwards, that prince, and his mother Maud the empress, removed the religious to Stanley, near Calne, where they built and endowed an abbey for thirteen white monks, dedicated to the Virgin Mary. The religious house, at the suppression, was endowed with a revenue of one hundred and seventy-seven pounds and eight-pence *per annum*.

At Bradenstoke, a little to the north-east of Chippenham, Walter de Eureus founded, in the year 1142, a priory of black canons, dedicated to the Virgin Mary, and valued, at the dissolution, at two hundred and twelve pounds, nineteen shillings and three-pence *per annum*.

At Lacock, near Chippenham, Ela, countess dowager of Salisbury, founded, in the year 1232, a nunnery, for eighteen nuns of the order of St. Austin. It was dedicated to the Virgin Mary and St. Barnard; and, at the dissolution, possessed of revenues amounting to one hundred and sixty-eight pounds, nine shillings and two-pence *per annum*.

Calne is a populous, well-built borough-town, situated on a rocky hill near a rivulet of the same name, eighty-eight miles from London. It was made a borough by Richard earl of Cornwall, and has sent members to parliament ever since the twenty-sixth year of Edward I. It is governed by two bailiffs, chosen annually, and burgeses without limitation. Here was formerly a palace of the West-Saxon kings, and has still a good manufacture of cloth. Here is a charity-school for forty boys, and a very neat church. In the year 977, a synod or convocation was held in this town, at which the king, nobility, and most of the bishops, were present, to decide a contest between the regular and secular priests, relating to the celibacy of the clergy, and to the monks holding benefices, which the seculars considered as an encroachment upon their rights. During the course of the debate, while a Scotch bishop was pleading for the seculars, all the timbers of the assembly-room suddenly gave way, and the whole fabric fell to the ground. By this accident most of the secular priests were killed, and buried under the ruins; and many of the other priests were wounded, and some killed: but the seat of archbishop Dunstan, the chief advocate for the monks, and that of the president of the synod remaining firm, their preservation was considered as a miraculous declaration of heaven in their favour; upon which the secular priests in Dunstan's province were turned out, and monks placed in their room.

In the month of November 1725, it rained here so excessively, that the river suddenly overflowed its banks, and some of the inhabitants were drowned in the street, in sight of their neighbours, who could afford them no relief. The flood damaged several houses, and vast quantities of goods; and, among other things of great weight, carried away a cask of oil, containing an hundred gallons.

Here was an hospital in the reign of Henry III. governed by a master, warden, or prior, and valued, upon the dissolution, at two pounds two shillings and eight-pence *per annum*. The manor, prebend and parsonage of Calne, are held, by leases of several lives, from the dean and chapter of Salisbury.

Calne has a weekly market, well frequented, on Tuesday, and two annual fairs, the first on the sixth of May, for horses, black cattle, sheep, and cheese; and the second on the second of August, for toys.

Near Calne are the remains of a Roman station, supposed to have given rise to the town, and where Roman coins have been frequently found.

Malmesbury, which was the next place we visited, is situated on the side of a hill, the foot of which is washed by the Avon, eighty-nine miles from London. It has no less than six bridges over the river, and is said to have been built by Mulmutius, a British prince. It was formerly

metly encompassed with walls, and had a large strong castle, which was razed afterwards, to make room for a large abbey, whose abbot sat in parliament.

The castle belonged to the bishops of the West Saxons, and was called Ingleborn, till it was changed into Maildubury, now contracted into Malmesbury, from Maildolph, an Irish scholar, who some time lived the life of a hermit, in a wood, at the foot of the hill; but afterwards opening a school, devoted himself, together with his scholars, to a monastic life; and about the year 640, built a small monastery here. One of his scholars, named Aldhelm, deserves to be particularly mentioned, not only for turning the little monastery into a stately abbey, of which he was himself the first abbot, and for his being afterwards canonized; but also for his being the first Saxon that ever wrote in Latin, and the first that taught his countrymen to make Latin verses, according to the resolution he had made in the following distich:

*Primus ego in patriam mecum, modo vita superstit,
Aonio rediens deducum vertice Musas.*

I to my country first, if spar'd by fate,
Will bring the Muses from their native seat.

King Athelstan made Aldhelm his titular saint, and for his sake granted the town large immunities, enriched the monastery by his bounty, and was buried under the high altar of the church; where the inhabitants still shew his monument. Aldhelm's memory is also preserved, by the name of a meadow near this town, called Aldhelm's Mead; and till the reformation took place, they had several other memorials of him, among which were his psalter, the robe in which he said mass, and a great bell in the steeple, called Aldhelm's Bell.

Malmesbury is a neat town, gives name to its hundred, and carries on a considerable trade in the woollen manufacture. It was first incorporated by Edward, king of the West Saxons, about the year 916, and the charter confirmed by his son Athelstan in the year 939; but is now governed, according to a charter of William III. by an alderman, who is chosen annually, twelve capital burgeses, and four assistants, landholders, and commoners.

Vast piles of building were pulled down at the dissolution; but the site of the abbey, with all the demesnes belonging to it, was purchased by one William Stump, a clothier, for fifteen hundred pounds; by which means the abbey-church was spared, great part of which still remains, and is used as a parish-church, but the choir is forsaken. Mr. Jenner, goldsmith in London, built and endowed an alms-house here for four men and four women; and near the bridge is an hospital for lepers, on the spot where there was formerly a nunnery, which was suppressed in the seventh century by St. Austin, under pretence that the religious had suffered themselves to be debauched by the soldiers of a neighbouring castle. The large abbey already mentioned, was at first dedicated to our Saviour, St. Peter, and St. Paul, and afterwards to the Virgin Mary and St. Aldhelm. At the suppression, it was endowed with revenues amounting to eight hundred and three pounds, seventeen shillings and sevenpence *per annum*.

This town sends two members to parliament, has a weekly market on Saturday, and three annual fairs, viz. the seventeenth of March, the seventh of April, and the twenty-sixth of May, for horses and black cattle.

Wotton-Basset is a small town, seventy-eight miles from London. It is a very mean place, and the houses in general thatched with straw, though a borough both by charter and prescription; governed by a mayor, two aldermen, and twelve capital burgeses. Here is a small manufacture of cloth, and a charity-school, but nothing else remarkable. It sends two members to parliament, has a weekly market on Thursday, and three annual fairs, held on the fourth of May, the thirteenth of November, and the nineteenth of December, for the sale of cows and pigs.

Cricklade, or Crecklade, is situated at the influx of the rivers Chum and Rey into the Isis, or Thames,

eighty-one miles from London. It is an ancient borough by prescription, having sent members to parliament ever since the twentieth year of Edward II. is governed by a bailiff, and contains about fourteen hundred houses. Here is a free-school, built by Robert Jenner, and endowed with forty pounds a year. The river is navigable to London from this place. In the reign of Henry III. there was an hospital here dedicated to St. John the Baptist, under the government of a warden or prior; but there are now no vestiges of the structure. Some writers will have this town to have been formerly called Greekslade, from some Greeks who here taught their own language, till they were removed to Oxford, where they laid the foundation of an university; but as this story seems to have no other foundation than the similarity of the sound of Crecklade to Greekslade, it is generally considered as fabulous.

Here is a weekly market on Saturday, and two annual fairs, the first held on the second Tuesday in April, for sheep, cows, and calves; and the second on the twenty-first of September, for chapmen's goods and hiring of servants.

Highworth has its name from its high situation on a hill, near the borders of Berkshire, seventy-three miles from London. It is governed by a mayor and an alderman, but has nothing remarkable. Here is a weekly market on Wednesday, and two annual fairs, viz. the twelfth of August, and the tenth of October, for black cattle, pigs, sheep and horses.

Swindon is a small market-town, about six miles south of Highworth, and seventy-three west of London. It has nothing remarkable, except a fine prospect over the vale of White-horse. It has a small market on Monday, and four annual fairs, viz. Monday before the fifth of April, the second Monday after the eleventh of May, the second Monday after the eleventh of September, for cattle of all sorts, pigs and sheep; and the second Monday in October, for ditto, and fat cattle.

Auburn is a small, inconsiderable town, situated near the borders of Berkshire, eighty-one miles from London. It gives its name to the neighbouring chase or forest, and is the chief town in the hundred of Ramsbury. It has a market on Tuesday, but no annual fair.

Ramsbury is a small place, situated on the river Kennet, in the road between Newbury and Marlborough, and remarkable for its beer, great quantities of which are constantly sent to London. It was made the see of a bishop in the beginning of the tenth century; but about the year 1060, the diocese was united to that of Sherborn in Dorsetshire, and the united sees translated by bishop Herman, in the year 1072, to Old Sarum. This place has no weekly market, but two annual fairs, viz. the fourteenth of May, and the twenty-fifth of September, for horses, cows, sheep, and toys.

Marlborough, so called from its situation at the foot of a hill of chalk, or marle, seventy-five miles from London. It is an ancient borough by prescription, and is governed by a mayor, two justices, twelve aldermen, twenty-four burgeses, a town-clerk, two bailiffs, two sergeants at mace, and other officers. It is pretty well built; but consists chiefly of one broad street, with piazzas along one whole side of it, two parish-churches, and several commodious inns, it being the grand thoroughfare from London to Bath and Bristol. Here is a charity-school, founded in 1712, for forty-four children, but the principal tradesmen in the town are shop-keepers.

Marlborough was formerly a Roman town, called Cunetrum; but from the coming in of the Saxons to the Norman conquest, its name hardly occurs in our annals; nor do we find any thing remarkable of the town or castle, till king Richard I. was taken prisoner in his return from the Holy Land, when John, that king's brother, thinking he would never more see this kingdom, seized this, together with several other castles; but upon Richard's return, was again reduced, after a short siege. In the year 1262, Henry III. held a parliament here, in which these laws, that still retain the name of Marlborough statutes, were made; but it is now so ruined by time, that there are only a few remains of the walls and ditch. The seat of the late duke

duke of Somerset was the site of the Roman *castrum*, for there several foundations and Roman coins have been found: and towards the river, without the garden walls, one angle of it still evidently remains, with its rampart and ditch entire; but the present road separates it from the house. The ditch is still twenty feet wide in some parts. The mount, so much noted, was the keep of the castle, and is now made into a pretty spiral walk, on the top of which is an octogan summer-house, whence you have a very pleasant view over the town and country. This seat has been for some years converted into an inn, and forms the completest and most magnificent house of entertainment in Europe. The river Kennet, which was some years ago made, rises near this town, and falls into the Thames a little below Reading.

Here was formerly a priory of the Sempringham order, before the reign of king John, some remains of which are still visible. It was a royal foundation, dedicated to St. Margaret, and valued, upon the suppression, at thirty pounds nine shillings and six-pence *per annum*. Here was also, before the sixteenth year of the reign of king John, an ancient hospital for brethren and sisters. It was dedicated to St. John the Baptist, and valued, upon the suppression, at six pounds, eighteen shillings and four-pence *per annum*.

Besides these, there was another hospital for a master, and several poor sick brethren, built in the beginning of the reign of Henry III. It was dedicated to St. Thomas of Canterbury, and, in the reign of Richard II. annexed to the priory of St. Margaret, above mentioned.

Marlborough sends two members to parliament, has two weekly markets, held on Wednesday and Saturday, and two annual fairs, viz. the tenth of July, and the twenty-second of November, for horses, cows, and sheep.

On Marlborough downs are several ancient barrows, one of which, called Milbarrow, is inclosed with a circle of stones, about six or seven feet high; and is supposed to be the sepulchre of some Danish commander.

On these downs are a great many large stones, called the Grey Wethers. At a distance, they have the appearance of a flock of sheep lying down in different places. Some of them are full as large, and of the same kind with those at Stone-henge.

On a hill, to the north of Marlborough, are the ruins of a vast fortification, still called Barbury-castle. It is surrounded with a double ditch, and is supposed to be the place where Kenrick, king of the West Saxons, and his son Ceaulin, fought against the Britons, in the year 556.

About seven miles to the eastward of Marlborough, is a village called Froxfield, in which is a handsome and well-endowed alms-house, founded by Sarah, dutchess dowager of Somerset, relict of John, the last duke of the elder branch of the last family of the Seymours, descended from the great duke of Somerset, protector of the king and kingdom during the minority of Edward VI. This lady bequeathed by her will above two thousand pounds for the building and furnishing this alms-house, and devised several manors, messuages and farms, for the maintenance of thirty poor widows, not having twenty pounds *per annum* to subsist upon; one half of which are widows of clergymen, and the other of laymen; giving a preference to those of the latter, who live on the manors so devised. She left in her will particular direction for the form, dimensions, and site of the structure, as well as for the manner of electing, ruling, and providing for the widows; all which her executors punctually observed.

The building is neat and strong, in the form of a quadrangle, having one front, and a court before it, facing the road. It contains thirty ground-rooms, and as many chambers, one of each sort being allowed to every widow for her apartment, with an area or plat in a garden, lying on the north side of the building, inclosed with a brick wall.

In the centre of the quadrangle is a handsome chapel, furnished with a communion table, pulpit, desk, pews, and book, for the use of the widows, where the chaplain, whose stipend is thirty pounds *per annum*, is to read

prayers every day, and to preach on Sundays; and for his further encouragement, is to be presented, on a vacancy, to the rectory of Kenrish, in the same county, which the dutchess has appropriated to that use. Besides the yearly pension in money, which is now about eight guineas, she hath also ordered a cloth gown, with a certain quantity of wood, to be given to each of the widows every winter; and when the estates, which she has given to the alms-house, many of which are now demised upon leases for life, shall fall in, and produce a clear annual income of more than four hundred pounds, she has appointed additional lodgings to be built for the reception of twenty more widows, who are to be placed on the same establishment, elected, and provided for, in the same manner as the thirty former; and then all the rents, profits of the said estates, the salaries of the chaplain and steward being first deducted, are to be distributed, in equal shares and proportions, between the fifty widows.

The same charitable lady, willing to make provision for the helpless young, as well as the destitute old, has also bequeathed a considerable yearly sum for the apprenticing of ten or twelve children, in which a preference is to be given to such as were born in her manors.

Great Bedwin, about three miles from Froxfield, and seventy-two from London, is an ancient borough by prescription; and in the Saxon times was a city, and defended by a castle, the ditches of which are still visible. It is governed by a portreve, chosen annually at the court-leet of the lord of the borough; but the bailiff and other officers are chosen by the portreve. The church is a spacious fabric, in the form of a cross, built of flints cemented with mortar, almost as hard as the stones themselves. In the centre is a high tower, containing a ring of six good bells. The structure is decorated with ancient monuments, among which is one erected to one Adam Scott, a knight-templar, with an inscription now obliterated; and another to Sir John Seymour, father to the protector of the kingdom during the minority of Edward VI.

Great Bedwin has a weekly market on Tuesday, and two annual fairs, the first held on the twenty-third of April, and the second on the fifteenth of July, for horses, cows, sheep, and hardware.

We now entered Savernack-forest, which belonged to the late earl of Ailesbury, and is, perhaps, the only privileged ground of hunting, under that denomination, possessed by a subject. It is about twelve miles in circumference, plentifully stocked with deer of a large size, and rendered very pleasant and delightful by the many walks and vistas lately cut and levelled through the several copes and woods with which it abounds. Eight of these vistas meet like so many rays of a star in the centre of the forest, where his lordship cleared the ground for erecting an octagon tower, whose sides were to face the vistas, through one of which there is a view of the seat, which is about two miles distant, and called Tottenham, from a park of that name in which it is situated, contiguous to the forest.

It is a stately edifice, erected on the same spot formerly occupied by an ancient palace belonging to the marquis of Hereford, afterwards duke of Somerset, so justly celebrated for his steady adherence to the royal cause during the whole course of the civil war. This palace being destroyed by fire, the present structure was erected to supply its place. It was built from the designs, and under the direction of the late earl of Burlington, and has four towers and four fronts, each of them finely beautified and adorned in a manner different from one another. Four wings are now added, wherein are rooms of state, and a noble and capacious library, filled with a choice and judicious collection of books in all languages.

The beauty and delightfulness of the buildings are greatly augmented by the large canals, and the spacious, well-planted walks, which surround it; among which, that leading to the London road extends two miles in length.

About the same distance from hence, are the remains of a large house, once the seat of Sir John Seymour, called

called Wolf-hall; but nothing more now remains of this large fabric, than what is sufficient for a farm-house. Here, it is said, Henry VIII. celebrated his nuptials with the lady Jane Seymour, and his wedding-dinner was served up in a large barn, hung with curious tapestry on that occasion. In confirmation of which, they still shew you several tenter-hooks driven into the walls, having on them small pieces of tapestry. Between this place and Tottenham there is a walk formed with very old trees, still known by the name of king Harry's Walk.

Leaving this place, we crossed the famous ditch, called Wansdyke, which runs across Wiltshire from west to east. The name Wansdyke is a corruption and contraction of Waden's ditch, or the ditch of Waden, a Saxon deity, the reputed progenitor of the Saxons. The name, however, has given rise to a fabulous and extravagant opinion among the common people, that this ditch was cut by the devil on a Wednesday. Wansdyke divides the county nearly into two equal parts, and may be traced from near the city of Bath, in Somersetshire, to Great Bedwin, upon the borders of Berkshire. Antiquaries are divided in their opinions with regard to the origin of this ditch: some think it was a boundary between the Belgæ and Dobuni, who dwelt here in the time of the Romans. Mr. Camden believed it was thrown up by the Saxons, as a boundary between the dominions of the West Saxons and the Mercians; but others are persuaded, that it was cut long before the kingdom of Mercia was settled, viz. by Cerdic, the first king of the West Saxons, or at least by Kenric his son, as a barrier against the incursions of the Britons from their garrisons at Bath, Gloucester, and Cirencester; and this opinion is supported by William of Malmesbury, who says, that in the year 590, the Saxons were defeated by the Britons at Wadensdyke. The rampart and garff of this ditch are very large, and the rampart is on the south side.

At Abury, on the Marlborough downs, not far from Wansdyke, are a few huge stones, like those at Stonehenge. These stupendous remains are also supposed to be the ruins of an ancient temple of the Druids. Dr. Stukely is of opinion, that this temple is much more ancient than Stonehenge; and is so large, that the whole village of Abury is now contained within its circumference. A high rampart, with a proportional ditch on the inside, surrounds it, which sufficiently proves, that it was not a fortification, because the ditch would then have been on the outside of the rampart.

From Abury to West Kennet there is a kind of walk, about a mile long, which was once inclosed on both sides with large stones: on one side the inclosure is broke down in many places, and the stones taken away; but the other side is almost intire. On the brow of a hill near this walk, is a round trench, inclosing two circles of stones, one within another; the stones are about five feet in height, the diameter of the outer circle one hundred and twenty feet, and of the inner, forty-five feet. At the distance of about two hundred and forty feet from this monument, great quantities of human bones have been discovered, supposed to have been those of the Saxons and Danes slain in the battle of Kennet in the year 1006.

In a field near Kennet are three huge stones, called the Devil's Coits, which Dr. Plat thinks, were certain deities of the Pagan Britons: they stand upright, near the road from Shepherd's Sherd to Marlborough.

At Badmington are nine caves, situated in a row, but of different dimensions, the least of them four feet wide, and from nine to ten feet long. They are found by two long stones set on the sides, and the top covered with broad flat stones. Spurs, pieces of armour, and the like, have been found in these caves, a sufficient reason to think they are the sepulchres of some ancient warriors; but whether they were Romans, Saxons, or Danes, cannot now be known.

About six miles south-west of Abury, is a village called Heddington, thought to have been once a Roman colony, from the foundations of houses that have been dug up here for a mile together, and from the silver and

copper coins struck by the Roman emperors, often found here, some of which have been sent to the Royal Society, and others to the Ashmolean Museum at Oxford. It was here that Alfred the great, in the year 878, totally defeated the Danes, when nothing was able to resist the English, doubly animated by hope and revenge. The sword was that day let loose upon the barbarians, and amply compensated for the miseries they had before inflicted on the inhabitants. It was anciently Edendon; and William, favourite of Edward III. and bishop of Winchester, took his surname from hence, as being the place of his birth, and where he afterwards, about the year 1317, built a new church, and founded a chantry or college, consisting of a dean and twelve ministers, of whom part were prebends: these were, in 1358, changed into a reformed sort of friars of the order of St. Austin, called Bonhommes, who were under the government of a rector; and, at the suppression, enjoyed yearly revenues to the amount of four hundred and forty-two pounds, nine shillings and seven-pence.

Devises, Devizes, or the Vies, called Divisio by Florence of Worcester, probably from its being formerly divided between the king and the bishop of Sarum, is an ancient town, situated about the middle of the county, eighty-nine miles from London.

It was incorporated by king Charles I. and is governed by a mayor, a recorder, eleven masters, and thirty-six common-councilmen. It is a large, populous town, consisting principally of two long streets, parallel to one another. The houses are built on an excellent model, but constructed chiefly of timber, and, though old, have not a bad appearance. In the town are two parish-churches, one dedicated to St. Mary, and the other to St. John. Here is also a meeting-house for protestant dissenters, and a very good charity-school for seventy boys and sixteen girls. Fifty of the boys are clothed, and the rest, together with the girls, equally instructed in such branches of education as are necessary for servants. The town stands on an eminence, but is screened from the easterly winds by the adjacent hills. Its situation often exposes the inhabitants to a want of water; and though there is an excellent spring as the foot of Rundway-hill, the inhabitants have not yet taken the precaution to convey the water into the town, which might be done at a very moderate expence. Here is a good manufacture of cloth, particularly druggets; besides which, the inhabitants carry on a very considerable trade in malt.

This town was formerly defended by a castle, said to have been originally built by the Romans; but afterwards rendered almost impregnable by Roger the rich, bishop of Sarum, who was at a vast expence to render it the finest castle in the kingdom. That prelate was at first only a mass-priest, but afterwards the second man in the kingdom. He was a principal instrument of placing king Stephen on the throne, nor did that prince prove ungrateful to him; but afterwards offending him, the king resolved to seize both him and his nephews, one of whom was bishop of Ely, who made his escape to the castle of the Devises, and held it out against the king, who came in person to reduce it, that he might seize the treasure, which he knew Roger bishop of Sarum had hoarded up there. The bishop of Ely refusing to surrender upon the king's summons, he caused a gallows to be erected, and threatened to hang Roger, the prelate's son, whom the king had in his custody, if the place was not yielded to him immediately. The halter was accordingly put about the young man's neck, and the bishop of Salisbury, who was also the king's prisoner, earnestly intreated his nephew of Ely to comply, protesting he would neither eat nor drink till the castle was delivered. Upon this the execution of the lad was respited; but Ely suffered his uncle to fast three days, which threw him into an intermitting fever, of which he died. The castle was, however, surrendered, and forty thousand marks of silver, besides great quantities of gold, plate, and jewels, were found in it. The castle being thus in the hands of the king, the government of it was thought so honourable, that it was often accepted by some of the prime nobility. During the late civil wars, it was several times besieged, and at last totally demolished

lished by the parliament's forces. At present, few vestiges of it remain, the materials having been taken away, and two wind-mills erected on the spot it once occupied.

Just without the town is a pretty plain, called the Green, on which is a very handsome church and steeple, with a considerable number of houses, forming a suburb to the old town. Here one William Cadby, a gardener, found, in the year 1714, a large urn full of Roman coins, buried under the ruins of an ancient structure; and near it several Heathen deities crowded between flat stones, covered with Roman brick. These deities, afterwards carried about the kingdom as a shew, were supposed to have been buried about the year 234, when the Romans were called out of Britain. This collection consisted of a Jupiter Ammon, about four inches long, weighing somewhat more than four ounces. Neptune, with his trident, the teeth of which are much shorter than usually represented. This figure is about four inches in length, and weighs four ounces. A Bacchus, nearly of the same weight and dimensions. A Vulcan, something less than any of the figures already mentioned. A Venus, about six inches long, the left arm broken off, but the figure much the best finished of any in the whole collection. A Pallas, with a spear, shield, and helmet, between three and four inches in length. A Hercules, about four inches long, weighing six ounces and a half. Besides these, there were a Mercury, a vestal virgin of very curious workmanship, the wolf with Romulus and Remus, some Egyptian deities, and a coin of the emperor Severus.

The Devizes sends two members to parliament; and its weekly market, which is held on Thursday, is reckoned one of the best in England for corn, wool, horses, and all sorts of cattle. Besides this, six annual fairs are held here, viz. the thirteenth of February, for cattle; Holy Thursday, for cattle, horses, and sheep; the thirteenth of June, for horses; the fifth of July, for wool; the second of October, for sheep; and the twentieth of October, for sheep and hogs. The latter continues six days, and is held upon the Green.

On Rundway-hill, near this town, is a square camp, surrounded with a single trench, supposed to have been Roman. Many Roman coins, of different emperors, have been found here, and in the neighbourhood, together with pots, and other earthen vessels, supposed to be of Roman antiquity. Here the king's forces, under prince Rupert, entirely defeated the parliament's army, commanded by Sir William Waller.

Lavington; called also East Lavington, and Market Lavington, by way of distinction, from a village situated near it, called West Lavington, and another in its neighbourhood, termed Bishops Lavington, was the next place we visited, and is a considerable market-town, eighty-seven miles from London. Here are some almshouses, and a charity-school for thirty-six children, who are instructed, and have books given them: the girls are taught knitting and needle-work. Here are two weekly markets, held on Monday and Wednesday, the latter very considerable, for corn; but no annual fair.

On the west side of the Avon, a little above Great Dornford, is Vespasian's camp, called the Walls; and near it three other camps, which seem to be the remains of Vespasian's victories, and intimate, that he subdued the country, as it were, by inches.

North of these is Martin's-hall-hill, a vast stationary Roman camp. On two sides the precipice is frightfully steep, and the other sides not easily ascended. A brass Alexander Severus, having on the reverse Jupiter *fulminans*, was some years since found here. On the west side, without the camp, and near the summit of this hill, is a round pit of excellent spring-water, always full, even in the driest summers, and never running over. This water is often of the greatest service to the adjacent country, and thousands of cattle, in dry seasons, are every day driven thither, from a considerable distance, to drink. The prospect from the camp, on the summit of this hill, is truly enchanting.

Ludgerhal, or Lugeshall, which is an ancient borough by prescription, is situated near the forest of Chute, on the borders of Hampshire, seventy-five miles from London. It is situated in a delightful part of the county, and

was formerly the residence of several kings. It is governed by a mayor, chosen annually at the court-leet of the lord of the manor, but has nothing worth the notice of a traveller. It sends two members to parliament, and has an annual fair on the twenty-fifth of July, for horses, cows, and sheep; but no weekly market.

Of the INHABITANTS of Wiltshire.

The inhabitants of this county were formerly so renowned for their valour, that Johannes Sarisburiensis tells us, in his Polycraticon, that the natives of Wiltshire, together with those of Cornwall and Devonshire, challenged to themselves, for their bravery, the honour of being the reserve in our English armies. The present inhabitants are a rough, hardy, hospitable, and ingenious people, and speak a broad, and, if possible, a more grating dialect than their neighbours in Somersetshire. In the towns they are greatly refined, and speak with propriety. They are kind to strangers, and ready to do them all the good offices in their power.

Curious PLANTS found in Wiltshire.

Holy Thistle, *Carduus Benedictus*, found in various parts of the county, especially near Salisbury.

Avens, or Herb-bennet, *Caryophyllata*, found in Chute-forest, and other woods in this county.

Wild pink, or White-john, *Caryophyllus sylvestris vulgaris latifolius*, C. B. found in the pasture-grounds near Salisbury.

Hedge-parsley, *Anthriscus quorundum semine aspero hispido*, J. B. found in the thickets in most of the vallies in Wiltshire, particularly near Great Bedwin.

The lesser Centaury, *Centaureum parvum*, Ger. found in most of the upland pastures, near the Devizes.

Camomile, *Chamæmelum nobile*, Buxb. found upon the hills near Marlborough.

Wild or Dog-camomile, *Chamæmelum vulgare*, Park, found on the hills near the Devizes.

Celandine, *Chelidonium majus vulgare*, Park. found in the waste grounds near Heddington.

Pilewort, *Chelidonia rotundifolia minor*, C. B. found in the moist pastures near Trowbridge.

Wild Succory, *Chicoreum sylvestre*, Ray, found in the lanes by the hedge sides near Salisbury.

Herb Paris, *Sobanum quadrifolium bacciferum*, C. B. found in the moist meadows near Bradford.

Long-rooted Hawkweed, *Hieracium longius radicum*, Ger. found in most of the meadows near Malmesbury.

Wild Clary, *Lavandula flore*, C. B. found near Marlborough.

St. John's-wort, *Hypericum vulgare*, J. B. found in the hedges near Salisbury.

Wild Lettuce, *Lactuca sylvestris*, C. B. found in the hedges near Hendon.

Chickling Vetch, *Lethyrus latifolius*, C. B. found in the forest of Chute.

White Water-lilly, *Leuconymphaea*, C. B. found in the river Willy.

Star Liverwort, *Hepatica terrestris*, Ger. found in the woods near Amersbury.

Cup-moss, *Muscus Pyxiodes*, C. B. found on most of the hills in this county.

Antique COINS, &c. found in Wiltshire.

Great quantities of Roman coins have been found at almost every place of note in this county, as we have already observed in describing the several places in Wiltshire; and shall only add here, that a Roman pavement of chequer-work was dug up, about a century ago, at Farley-park, a little to the south-west of Trowbridge; and that at Efcourt, a little to the north-east of Ludgerhal, there was dug up, in the year 1693, a large earthen vessel, with two smaller vessels within it, one of which was full of bones and ashes.

This county sends thirty-four members to parliament; two knights of the shire for the county, two citizens for the city of Salisbury, and two burgeses for each of the following boroughs, Devizes, Marlborough, Chippenham, Calne, Malmesbury, Cricklade, Hindon, Old Sarum, Heightsbury, Westbury, Wotton-Basset, Ludgerhal, Wilton, Downton, and Great Bedwin.

H A M P S H I R E.

HAMPSHIRE, or, as it is otherwise called, the County of Southampton, is bounded on the west by Dorsetshire and Wiltshire, on the north by Berkshire, on the east by the counties of Surry and Suffex, and on the south by the English channel. It is about sixty-four miles in length from north to south, thirty-six in breadth from east to west, and (exclusive of an island, called the Isle of Wight, of which a separate account will be given) one hundred and fifty miles in circumference. Its area is about fourteen hundred and eighty-one square miles, in which are contained thirty-nine hundreds, one city, eighteen market-towns, two hundred and fifty-three parishes, nine forests, twenty-nine parks, above thirty thousand houses, and, at the lowest computation, one hundred and eighty thousand inhabitants. The city of Winchester, which is situated nearly in the middle of the county, is sixty-seven miles from London.

R I V E R S.

The principal rivers in this county are the Avon, the Test, and the Itching. The Avon rises in Wiltshire, and passes through Salisbury, a little below which it begins to be navigable. It enters Hampshire at a village called Charford, passes near Fordingbridge, a considerable market-town; thence it continues its course to Ringwood, another market-town; and at Christ-church, a large and populous borough, near which it receives the Stour, a considerable river from Dorsetshire; and falls into the English channel.

The Test, or Tese, rises in the northern parts of Hampshire, passes by Whitchurch and Stokebridge, two borough towns in Hampshire, forming several islands at the latter; thence it passes to Rumsfy, and falls into an arm of the sea, called Southampton-water at Redbridge.

The Itching, called also the Alre, rises at Chilton Candover, a village near Alersford, a market-town in this county; thence it runs south-west to the city of Winchester, where it begins to be navigable: from Winchester its course is directly south, till it falls into Southampton water.

Remarks on the INLAND NAVIGATION of Hampshire.

The Avon, as we have already mentioned, is made navigable to near the city of Salisbury. Large ships go up to Christ-church; the mouth of the Avon being there very deep, and the tide rises seven or eight feet at that town. A few miles above that town, the navigation, by locks and sluices, begins. At Ringwood, the river forms an island, the navigation branch going on one side, and a considerable stream of water on the other. If some of the windings of this river were connected by canals, and the falls by that means avoided, the navigation would be greatly improved, both with regard to safety and expedition.

Lymington, a borough-town about eleven miles to the east of Christ-church, has a harbour for vessels of considerable burden. The town stands about a mile from the channel, running between the main land and the Isle of Wight. The tide flows near a mile above the town; but there being no place of note on the river, no art has been used to improve the navigation above the town.

About four miles to the eastward of Lymington, is a tide-harbour for small vessels, called Bewley, but very little frequented.

Southampton-water, or Triffanton bay, is navigable for large ships, the water being from three to ten fathoms deep at low water. Ships of burden go up to the quay at Southampton, and some up the north-west branch, as far as Redbridge.

The Test, or Tese, is not navigable farther up than the tide flows, which is about two miles above Redbridge, and might, at a very small expence, be made navigable to Rumsfy.

The Itching, which falls into Southampton-water on the east side of that town, is navigable to Winchester. The tide flows up near three miles above its mouth; and from thence to Winchester it was made navigable by art, in the time of William the Conqueror. The locks here are not of the best construction: they have, indeed, been considerably improved since they were first erected; but other improvements might easily be added, which would greatly facilitate the navigation.

About four miles below the mouth of the Itching is Hamble Creek, which is navigable above three miles from its mouth, and the channel so deep, that several ships of war have lately been built at Burleston, a village near three miles from its mouth.

Four miles below Hamble Creek, is another called Titchfield Lake, but is only navigable, for small vessels and boats, near its mouth.

Portsmouth harbour, one of the finest in the world, is the next on the coast of Hampshire. There is water sufficient for the largest ships; and so very capacious, that the whole English navy may ride here in safety. The principal branch runs up to Parham, a market-town about six miles to the northward of the harbour's mouth. A second goes up to Porcher, and a third to Portsea-bridge. Besides these branches, there are several rithes or channels, where the small men of war ride at their moorings. It is defended from all winds by surrounding lands, and from the fury of the sea by the Isle of Wight, which lies before the mouth of the harbour, about six miles distant.

About four miles further to the eastward is Langstone-harbour, which, like that of Portsmouth, is capacious enough to contain the whole navy of England; but a bar, or bank of sand, which stretches itself across the mouth of the harbour, renders the entrance something difficult for large ships, there not being a sufficient depth of water for them to enter at low water. Nor is its situation equal to that of Portsmouth; it is only defended from the sea in south-west, and westerly winds by the Isle of Wight; but the southerly winds blow right into the harbour, without any other shelter nearer than the coast of France. This harbour has, however, one advantage over most others that are barred; namely, its bar never shifts; it is always the same: whereas the bars of most others are so changed and shifted by every gale of wind, that there is no entering the harbour without a pilot. There is generally about two fathoms and a half water upon the bar at low water; but as soon as you are within the haven, it deepens to four, five, and six fathoms. Vessels of considerable burden go up to the mills at Bedhampton, which is near six miles from the harbour's mouth. One of the branches runs to Portsea-bridge, where it meets a branch of Portsmouth harbour, and boats are continually passing this way, from one harbour to the other, at high water. This passage is very convenient for carrying timber to the dock at Portsmouth, from the forests on the borders of Hampshire and Suffex; and accordingly large quantities pass that way. Another branch of Langstone harbour extends from the channel at Bedhampton, to the village of Langstone, where it is joined by an arm of Chichester haven; so that there is a communication by water between Deal-quay, near Chichester and Portsmouth, without passing through the mouth of either harbour.

The next harbour on this coast is that of Chichester, and is separated from Langstone harbour by Haling Island; but as this harbour separates the counties of Hampshire and Suffex, and the greater part of it lies in

the latter, we shall defer our account of it till we come to describe the county of Suffex: and with regard to the rivers, harbours, &c. in the Isle of Wight, we shall consider them in our description of that island.

A I R A N D S O I L.

The air of this county is, for the most part, pure and healthy, especially upon the downs, which cross the county from east to west, dividing it nearly into two equal parts; and it is observed, that the vapours in the low grounds near the sea, are not so pernicious as in other maritime counties. The hilly parts are barren, and fit only for sheep, great numbers of which are fed on these upland pastures; but the lower grounds produce great quantities of grain, particularly wheat and barley. There is nothing particular in the horned cattle in this county, but the hogs and sheep are reckoned to excel all others. The sheep are remarkably fine, both with regard to their flesh and wool; and the hogs, many of which live chiefly in the woods, on acorns, &c. make the finest bacon in England. Hampshire is also famous for its honey, of which great quantities are collected here. Its forests still abound with timber, notwithstanding the amazing consumption of that article in the royal docks at Portsmouth, and the many private yards for building ships in almost every maritime place in this county.

Remarks on the HUSBANDRY of Hampshire.

The husbandry in this county varies something in different parts of it. In the western parts, bordering on Wiltshire, the course of crops, with some small variation, is as follows: 1. fallow; 2. wheat; 3. barley; 4. oats, pease, beans, or vetches. Or, 1. fallow; 2. wheat; 3. barley; 4. hop-clover, or rye-grass, for two years. They plow three or four times for wheat; sow three bushels, or three bushels and a half, on an acre, and reckon three quarters a middling crop. For barley they plow twice, sometimes thrice, sow four bushels on an acre, and gain, on a medium, three quarters and a half, or four quarters. For oats they plow only once, sow from five to six bushels on an acre, and get, on a medium, from four to five quarters. They plow twice for beans, sow four bushels on an acre, and reap about two quarters; but they never hoe them, otherwise their crop would be greatly increased. With regard to the cultivation of pease, they vary considerably: in some places they plow but once, in others twice or thrice; both sow three bushels on an acre, and reckon two quarters and a half a middling crop. They vary still more in turnips; for about Rumsley, they plow four or five times for them, hoe them once, and feed them off with sheep for a wheat crop: but in the neighbourhood of Ashley, they plow up a wheat stubble, and harrow them in, and never hoe them.

The price of labour about Rumsley is,

In winter,	-	1s. per day.
In the summer, till harvest,	-	1s. 3d. ditto.
In harvest,	-	1s. 6d. with beer.
Or, with victuals and drink,	-	1s. 2d.
Reaping wheat,	-	4s. 6d. or 5s. per acre.
Mowing corn,	-	1s. 6d. or 1s. 2d. ditto.
----- grass,	-	1s. 6d.
Hoeing turnips,	-	2s. 6d.

Children about fourteen or fifteen years old, have fourpence or five-pence a day.

Between Rumsley and Winchester, the husbandry varies very little from that above mentioned, except in a few particulars. They feed their turnips off with sheep, as before; but instead of wheat, they sow barley. Sometimes they sow barley after vetches, but then they either feed the latter off with sheep, or mow them green for their horses, hardly ever letting them stand for seed or hay. The farms are, in general, small; two hundred pounds a year they reckon large; and lands let, on an average, grass and arable together, from seven to twenty shillings per acre; generally about ten shillings. The farmers keep great numbers of sheep, having most of them a right to commonage on the downs, and this

right is proportioned to the largeness of the farm. One of fifty pounds a year, for instance, has a right to feed three hundred on the common down. Some of the farmers near Winchester serve the inns with straw, and take the dung in return. They also bring coal and soap-ashes from thence, and purchase a waggon-load of the latter for two shillings and six-pence. They use four horses to a plow, and do about an acre in a day. Their measure is eighteen feet to the perch. The soil of some of the arable lands on the sides of the hills, is what they call White-earth. This is very dry, sound corn land, but very shallow, the pure chalk being a few inches below the surface, which varies from it only in its dryness.

The price of labour is as follows:

In winter to hay-time,	-	1s. per day.
Mowing hay,	-	1s. 6d. ditto.
Reaping wheat,	-	5s. 6d. per acre.
Mowing and raking corn,	-	2s. 6d. ditto.
Mowing grass, and making it into hay,	-	5s.
in the meadows,	-	3s.
Doing the same in other pastures,	-	3s.
Hoeing turnips, 4s. or	-	4s. 6d. per acre.
A boy of seven or eight years old, has	-	3d. per day.

The soil between Winchester and Aylesford is, in general, poor, and in the neighbourhood of the latter, land lets from five to ten shillings per acre; the grass land much higher. Their flocks of sheep are considerable, and the advantage of folding them well known. The price of labour the same as above mentioned.

Between Aylesford and Atton the country is very pleasant, and well cultivated, but not rich in soil. The land, in general, is light and dry, very healthy, and bears, by means of manure and good tillage, wheat and turnips, two vegetables which delight in opposite soils; but whenever any one yields both, it is a strong indication of what the farmers call a kindly soil. The rent of a whole farm, through this track, is generally seven or eight shillings an acre, grass and arable, one with another. The farms are, in general, small, from thirty or forty to one hundred and fifty pounds a year. They cannot indeed be so small here as in some counties, as the plough cannot be moved with less than four horses, and a farm of fifteen or twenty pounds a year would not be sufficient to keep them. Their course of crops is, 1. fallow; 2. wheat; 3. barley; 4. clover and trefoil, and some rye-grass two years. Or, 1. turnips; 2. barley; 3. grasses two years; 4. fallow; 5. wheat; 6. barley. They plow three times for wheat, sow three bushels, and reckon two quarters a middling crop. For barley they plow twice, sow four bushels, and reckon the medium produce at two quarters and a half. They very seldom plow more than once for oats, sow four and a half, or five bushels, and reckon three quarters the produce at a medium. The plow also once for pease, sow four bushels, or less, if the pea be small, and reckon two quarters and a half a middling crop. They never sow vetches; but in order to feed them off with sheep, or to cut them green for their horses, they plow but once for them, and sow two bushels on an acre. Whenever they sow these crops of oats, pease, or vetches, it is generally done in the room of barley. The culture of turnips has increased here prodigiously within the last twelve years, twenty acres being now sown, where there was one before that period. They plow three or four times for them, hoe them once, and feed them off entirely with sheep. Wheel-ploughs are also used here, and four horses will turn up an acre in a day. Some of the farmers here sow a piece of clover for fattening their hogs, a piece of husbandry that cannot be too much recommended, as we shall further observe when we come to consider the state of husbandry in Middlesex, where an ingenious cultivator has carried this branch of rural œconomy to great perfection.

The price of labour in the neighbourhood of Alton is as follows:

All the year round,	1s. per day, with beer, or 1s. 2d. without.
Reaping wheat,	4s. or, 4s. 6d. per acre.
Mowing barley and oats,	1s. 6d. ditto.
Mowing and raking ditto	1s. 8d.

Mowing

Mowing grafs,	-	-	1s. od.
Hoeing turnips,	-	-	5s. od.
Plowing land,	-	-	8s. od.
A lad of thirteen or fourteen years, has			4d. per day.

We could not help observing, that the farmers here keep double the number of horses that are really necessary. It is truly surprising, that persons who seem so well acquainted with rural affairs, should be so led by custom, as to throw away great part of their profits, merely to keep a large number of useless horses.

The soil between Alton and Farnham is much richer than that above-mentioned, and accordingly lets dearer, the medium price being from fifteen to twenty shillings an acre. Their principal crops are wheat, pease, and beans. They fallow for the first, then sow wheat, and, next, spring-corn. Others trench-plow for pease, after that, wheat, then soft corn, and then lay the land down with clover and rye-grafs for two years. They plow three times for wheat, sow three bushels, and reckon three quarters a middling crop, but they have often five. When they trench-plow for pease, they do not stir the land a second time; but when they use only common tillage, they stir it twice. They sow three bushels and a half on an acre, and reap, on a medium, three quarters. For oats they stir the land but once, sow four bushels on an acre, and reckon four quarters a middling crop. When they sow turnips, they plow thrice, hoe them once, and feed them off entirely with sheep. They use only wheel-ploughs, and never less than four, often five or six horses, which, in stiff lands, turn up an acre; and, in light soils, an acre and a half a day.

They reckon, that eighty acres of light arable land require five horses. One farmer, who rents two hundred and fifty acres of light arable land, keeps nine horses, one hundred and twenty sheep, three men, three boys, and four or five labourers, the whole year.

But the most remarkable husbandry in the neighbourhood of Farnham, is the culture of hops, of which they sow very large quantities, and are a vast improvement, as the landholders well know from experience. For the hop-grounds let here from three to nine pounds the acre; between seven and eight is the general price. The labour attending an acre of hops, they reckon three pounds ten shillings a year. The price of the poles is various, being proportioned to their length, from twelve to twenty-two shillings per hundred. They will last four or five years, and one thousand six hundred are reckoned sufficient for an acre. They reckon twelve hundred weight on each acre a middling crop, and the average price at six or seven pounds per hundred. Consequently, an acre of hop-ground, supposing the rent eight pounds a year, and the poles twenty shillings per hundred, will cost seventy-two pounds in four years; and the produce in that time, supposing the hops sell at five pounds per hundred, will amount to two hundred and forty pounds; a circumstance sufficient to shew the vast advantages attending the culture of this vegetable.

The lands in the southern parts of the county are nearly the same with those last mentioned, and the culture nearly the same; it will therefore be needless to enumerate either; but we must observe, that those arable lands which lie near the sea-shore, are greatly improved by the sea-weed, which, when mixed with dung, forms a fertile and lasting manure. But we could not find that the farmers ever made use of sea-sand as a manure, though there is great plenty of it in several parts, and even well mixed with shells and coral.

TRADE and MANUFACTURES.

This county has a very considerable foreign trade, carried on from the many ports and harbours with which it abounds; particularly from Christ-church, Lyminster, Southampton, Portsmouth, and the Isle of Wight. The chief manufactures are kerseys and cloth.

CITY, BOROUGHs, MARKET TOWNS, &c.

Rumsey was the first place we visited in this county. It stands on the road leading from Salisbury to Win-

chester and Southampton. This road between Salisbury and Rumsey, and the branch leading from thence to Winchester, is one of the finest in England, being, for many miles together, as level, firm, and free from loose stones, as the finest garden-walk; and though the traffic in it is very great by waggons, there is hardly a print of a wheel to be seen. The beauty of this road induced us to make enquiry into the methods taken for making and preserving it; and received for answer, That a foundation was first laid with large stones, and rendered level by smaller; a layer of chalk was then laid on that surface; and lastly, another layer of gravel sifted exceeding fine. This road, which is laid in a convex form, like the New and City roads, near London, wants very little repair, a fresh coat of fine gravel being sufficient, in two or three years; for the chalk has so cemented the whole together, that no part of it can move: it is solid like a rock, and will, with the necessary repairs, continue so for ages.

The town of Rumsey is situated on the river Test, or Tese, which runs hence into Southampton-water, seventy-eight miles from London. It is a pretty large, ancient town, governed by a mayor, a recorder, six aldermen and twelve burgesses. It is delightfully situated, and surrounded with woods, corn-fields, meadows and pastures.

King Edward the elder built here a monastery for monks; but king Edgar, about the year 960, changed it into a house of Benedictine monks, under the government of the abbess Merwenna; and St. Efleda, daughter of Ethelwald, was some time a nun, and afterwards abbess here. Mary, the only daughter of king Stephen, was also abbess of this convent, till Matthew of Alface, son to the earl of Flanders, conveyed her away privately, and married her; but he was so terrified by the thunder of the pope, that, after having had two children by her, he thought it prudent to return her to the convent. At the west end of the town is still a piece of an old wall, thought to be part of the above nunnery, which, upon the suppression, was valued at three hundred and ninety-three pounds, ten shillings and ten-pence *per annum*. In the church belonging to the nunnery, king Edward, and his son Alfred, were buried. The new church is a noble pile of building, in the form of a cross, arched with stone, and has semicircular chapels in the upper angles, where the two sides meet. Here is a good manufacture of cloth, a weekly market on Saturday, and three annual fairs, viz. Easter Monday, the twenty-sixth of August, and the eighth of November, for horses, black cattle, cheese, and hogs.

From Rumsey we turned to the west, in order to visit what is called the New Forest, a large tract of land, laid waste, merely for the pleasure of hunting, by William the Conqueror, who destroyed this country for thirty miles together, depopulating the towns and villages, pulling down the houses and churches, and driving the poor people from their habitations. Historians remark, that this art of tyranny and oppression did not escape the vengeance of heaven; for two of his sons, Richard, and William Rufus, both lost their lives in this forest; the former by a pestilential blast, and the latter by an arrow shot by Sir William Tynel, at a deer; but glancing on a tree, pierced the king's body, and killed him. Nor was this all; his grandson Henry, was here suspended by the hair of his head, entangled in the boughs of a tree, and continued in that dismal situation till he perished. The tree, against which the arrow, fatal to William Rufus, glanced, was ordered by king Charles II. to be paled round, and the people still pretend to shew it. But as this accident happened on the first of August, in the year 1100, it is not reasonable to think it can have subsisted so long a time. The warden of this forest has always been some person of the first rank. It is divided into nine walks, each of which has its proper keeper: over these are two rangers, besides a bawyer, offices proper for gentlemen, and accordingly held by those in the neighbourhood. The forest, in the last century, was well stocked with red deer, and the stags remarkably large.

Some years ago, a proposal was made to the lord treasurer Godolphin, for re-peopling this forest by the poor inhabitants

inhabitants of the Palatinate in Germany, who had been driven from their habitations. Doubtless, a very commendable scheme, but miscarried in the execution, to the disadvantage of England, and the misery of these poor distressed people.

It was proposed to draw in this forest a large square, containing above four thousand acres, marking out two large highways or roads through the center, crossing both ways; so that there should be one thousand acres in each division, exclusive of the land contained in those cross-roads.

When this was done, twenty men, with their families, who should be well recommended as honest, industrious people, expert, or, at least, capable of being instructed in husbandry, were to be singled out. Each of these families were to have two hundred acres of this land; so that the whole four thousand acres were to be distributed among these twenty families, for which they were to pay neither rent nor taxes for forty years, except what was necessary for repairing the roads, and providing for their own sick and poor. After twenty years, each was to pay fifty pounds a year to the crown.

It was also proposed to advance to each of these families two hundred pounds in ready money, as a stock to set them to work, and to hire labourers to inclose, clear, and prepare the land, which, it was supposed, could not be much to their advantage during the first year. They were to be allowed timber out of the forest to build themselves houses, barns, shades, &c. as occasion should require; also for carts, ploughs, harrows, and other implements of husbandry.

These twenty families would, in consequence of their own settlements, employ and maintain such a proportion of others of their own people, that the whole number of Palatines would have been provided for, had their number been much greater, and that without burdening the people of England: on the contrary, they would have proved an addition of wealth and strength to the nation in general, and to the county where they were to have been thus settled in particular.

The spot intended for this purpose was situated near Lindhurst, on the road leading from Rumsley to Lymington.

Fordingbridge was the first place we stopt at after leaving Rumsley. It is now an obscure town, but was once much larger than at present, having suffered greatly by fire. It stands on the river Avon, over which it has a stone-bridge, eighty-five miles from London. Here was formerly an hospital dedicated to St. John, annexed to St. Cross at Winchester; or, according to some writers, given to King's College in Cambridge. Here is a small weekly market on Saturday, and a yearly fair on the ninth of September, for toys and forest-colts.

In the neighbourhood of this town is an eminence, called God's-hill, on the summit of which, now overgrown with oaks, is an old camp. The steepness on one side of it, and a double trench thrown up on the other, shews it to have been once a place of great strength.

Leaving Fordingbridge, we continued our tour, along the banks of the Avon, to Ringwood, so called from its ancient inhabitants, whom the Romans termed Regni. It is a large, well-built town, on the banks of the Avon, ninety-six miles from London. It is a thriving place, and has a good manufacture of druggets, narrow-cloths, stockings, and leather; but the neighbouring meadows are frequently overflowed by the several streams into which the river is here divided. Here is a well-frequented market on Wednesday, and two annual fairs, viz. the tenth of July, and the eleventh of December, for pedlars ware and forest-colts.

Near this town the duke of Monmouth was taken by Perkin, in a ditch covered with fern, after his defeat at Sedgemoor.

About two miles to the north of Ringwood is the parish of Ellingham, the tithes of which, together with the chapel of St. Mary, were given to St. Saviour's le Vicompte, in the diocese of Constance, in Normandy, by William de Solariis, in the year 1163; upon which a cell was founded here, subordinate to that foreign

house; but this cell was afterwards, together with the rectory of Ellingham, given to Eaton-college.

Christ-church, which we next visited, is situated at the conflux of the Avon and Stour, one hundred miles from London. It was formerly called Twinam-bourne, from its situation between two rivers, but has its present name from its church being dedicated to Christ. It is a large and populous borough-town, governed by a mayor, a recorder, aldermen, bailiffs, and common-councilmen. The chief manufactures are silk stockings and gloves. The town-seal is the effigies of Baldwin de Redveris, earl of Devon, who is said to have obtained its first grants and privileges in the reign of king Stephen. The church was collegiate in the time of Edward the Confessor, was dedicated to the Trinity, and had a dean and twenty-four secular canons. But after the conquest, their college was rebuilt by Ranulph Flambard, bishop of Durham, who was some time dean here; and who dedicated the church to Christ. In the time of Henry I. Richard de Redveris, earl of Devon, greatly augmented the college revenues; and earl Baldwin, about the year 1150, procured a grant for changing the secular into regular canons, of the order of St. Austin. At the suppression, the yearly revenues of this priory amounted to three hundred and twelve pounds seven shillings *per annum*.

This town sends two members to parliament, has a weekly market on Monday, and two annual fairs, the first held on Trinity Thursday; and the second on the seventeenth of October, for the sale of horses and bullocks.

From Christ-church we passed along the sea-shore to Hurst-castle, built by Henry VIII. as a defence for the Mew Forest, which had, for several ages, lain open and exposed to the invasion of foreign enemies. It stands upon a point of land shooting out near two miles into the sea, and forming the shortest passage to the Isle of Wight. It is joined to the main land by a broad beach, against which the sea beats with great violence on high tides, in stormy weather, and southerly winds. This castle, which commands the sea on every side, has very thick stone walls, with regular platforms mounted with large pieces of cannon. Colonel Corbet brought king Charles hither, after taking him from the governor of the Isle of Wight. Here he was kept, sequestered from the world, for the space of three weeks, till he was carried to London to be tried. The only enjoyment that prince could have here, was a fair, uninterrupted prospect of the channel between the Isle of Wight on one side, of the English channel on the other, and of the great number of ships continually passing and repassing within sight of the castle: for he was here denied the conversation of his friends, and even deprived of the common benefits of the earth and air; the latter from the moorish grounds surrounding the castle, the unwholesome vapours arising from fogs, and from the filth and weeds cast upon the shore, being rendered very pernicious: and the former he was not permitted to tread, except within the narrow limits of the castle.

Lymington, or Lemington, to which we passed from Hurst-castle, is a populous, though small sea-port town, situated on a rising ground that commands a beautiful prospect of the Isle of Wight, and eighty-five miles distant from London. It is a corporation by prescription, consisting of a mayor, aldermen, and burgeses without limitation. The mayor is chosen by the burgeses, and sworn at the court of the lord of the manor. Its chief trade is in salt, of which great quantities are made here, and said to excel that made in most other places, for curing flesh. Great numbers of merchant ships are built here, there being water at the quay for vessels of considerable burden. The river on which the town stands, about a mile from its mouth, is navigable for boats two miles above the place, and might be extended still farther, were there any place of note on its banks. Here is a custom-house, and other officers to take care of the salt-duty, which is very considerable.

Lymington sends two members to parliament, has a weekly market on Saturday, and two annual fairs, viz. the twelfth of May, and the thirteenth of October, for horses, cheese, and bacon.

At a small village called South Badesley near this town, there was a preceptory of the knights Templars, and afterwards of St. John of Jerusalem, valued at one hundred and eighteen pounds sixteen shillings and seven pence *per annum*.

During our stay at Lymington some business of importance called us to Winchester the capital of Hampshire, and which we shall therefore now describe.

Winchester, or Winton, which is also the metropolis of the ancient Belgæ. It stands upon the Itching, in a vale, where another small river joins it, sixty-seven miles from London. 'Tis the Venta Belgarum of Ptolemy and Antoninus, from whence its bishops are often called, in our histories, Ventanus. The Britons named it Caer Gwent, the old Saxons Wintanceaster, and the Latin writers Wintonia. Leland derives the name from the British word *guin*, or *guen*, *i. e.* white, as if it should signify caer gwin, or the white city, because of its situation in a soil of chalk, or whitish clay; for it lies in a bottom like an amphitheatre, surrounded with chalky hills. 'Tis supposed to have been built nine hundred years before Christ. Undoubtedly this city was very famous in the time of the Romans, when according to Cujacius and Pancirollus, there were looms here for weaving cloths for the emperors, and their army, and for making sails, linen shrouds, and other necessaries for the furniture of their mansions or quarters. Our historians tells us, that in the time of the Romans, Constantine the monk lived here, when his father Constantine first set himself up for emperor; and that, upon his being routed and slain, the monk was taken out of this city, and put to death, in revenge for his own, as well as his father's ambition. That their was a college of religious men here, in the earliest times of Christianity, is generally agreed; and the old piece of wall, near the West gate of the cathedral, is thought to be the remains of it. 'Tis of great strength and thickness, with several windows in it; consists of small flints, with mortar as hard as stone; and is supposed to have been a Roman building. On St. Catherine's hill, near this city, is a camp; and on the side of the west gate was a castle, where the West Saxon kings are supposed to have kept their court. As to king Arthur's exploits in these parts, and his round table in the castle, with his two dozen of knights, that he used to carouse with, they are deem'd equally fabulous. 'As to the table, says Mr. Cambden, which still hangs up, it plainly appears to be of much later date; for in former ages, when tournaments were made use of, by way of military exercise, to train up their soldiers, they had these round tables, that there might be no dispute among the noble combatants for precedency. And this seems to have been a very ancient custom. For Athenæus tells us, That the old Gauls did sit at round tables, and their armour-bearers stood at their backs.' This table, which is one piece of wood, is still shewn at the hall where the assizes are kept. 'Tis a piece of antiquity, pretended to be of above 1200 years standing; and there are illegible Saxon characters, said to be the names of twenty-four knights. The hall is supported by marble pillars.

Fox tells us, That Kingulfe, a king of the Mercians, first founded the church here, which is one of the richest and noblest sees in the kingdom, and has been so much talked of all over Europe, that though, for other particulars of its antiquity and original, we refer to Dugdale's Monasticon, bishop Godwin, Mr. Gale, &c. yet we shall just mention some of the principal events that happened both to this church and city, during the successive bishops. Godwin quotes a MS. which says, that, during the persecution by Dioclesian, this church was destroyed, and the priests belonging to it forced to fly, or renounce their religion; that about twenty years after, A. D. 309, it was rebuilt, but in 519, Cerdic, the first West Saxon, being a pagan, converted it to a temple of Dagon, and slew, or drove away, all the priests and monks that officiated in the church and monastery. Thus far the MS.

The first bishop of this see was Wina, a Frenchman, preferred to it by Kinewall, or Kenwalchius, (the son

of the above-mentioned Kingulfe) who, says Mr. Willis, translated the see of Dorchester hither anno 663, and from this Wina some have vainly imagined, that the city took its name. He lies buried in the North part of the presbytery. He is the first simonist of a bishop that is mentioned in our history; for, before his death, he fell under king Kinewall's displeasure, was driven out of his diocese, and bought that of London of Wulphire, king of Mercia. The diocese of Sherburn was taken out of this of Winchester, by king Ina.

Egbert, having subdued the petty kings of this island, was crowned sole monarch of England, in a council held at this city. One of its bishops, soon after this, was Swithin, who was tutor to prince Ethelwolf, king Egbert's youngest son; and such was his repute at Rome, that he was canonized. This is the saint, on whose festival if it chance to rain, the superstitious, credulous vulgar prophesy, that 'twill rain 40 days after, more or less; for want of knowing that certain rainy constellations appear in our hemisphere about the time of his festival, and not considering, that the festivals of the weeping St. Margaret the Virgin, and Mary Magdalen, follow soon after. He was, by his own appointment, buried in the church-yard of the cathedral. In his time the Danes destroyed this city, where the monkish writers tell us of a single combat that was fought between Guy earl of Warwick and Colbrand, a Danish giant. His next successor but one, viz. Denewulf, was buried in this church, who, at first, was only a keeper of swine in Somersetshire; but, for his sheltering king Alfred from the Danes, that king, when he recovered his crown, having observed his great natural parts, caused him to study, though he was in years; and when he had got a competent stock of learning, gave him this bishoprick. A monastery was built a little way to the South of the cathedral, by Edward the Elder, according to the will of his father king Alfred, which was richly endowed and privileged by king Edward, his son and successor, and the succeeding kings. Fuller says, it was termed the New Minster, to distinguish it from the cathedral, called the Old Minster; but they proved in the sequel to be very bad neighbours. King Edward the Confessor, son to Emma, being sent for by the barons of England after the death of Hardicanute, son of Canute the Dane, came over, and was crowned in this city by Edsius, the archbishop of Canterbury: At the same time Alwyn, who was then bishop of this see, was confined to the monastery here, and queen Emma to the nunnery at Whorwell in this county, being both charged with holding an impure commerce, of which the queen purged herself, by that called the fiery ordeal; whereupon the king asked her pardon, and the bishop was released, and taken into favour. In token of her deliverance, queen Emma gave nine manors to St. Swithin's church. The bishop dying in 1047, was buried in the north wall of the presbytery. He was succeeded by the Confessor's chaplain Stigand, Anno 1052; but William the Conqueror, who kept his court here, deprived him, and made him a prisoner for life in the castle, where he died, and was buried not only in the same tomb, but, as it is said, in the same coffin with Wina. This bishop's successor, Walkelin, about 1070, began to build the cathedral. In his time Waltheof the great Saxon, earl of Northumberland, was beheaded here, (in the place where St. Giles's chapel was built afterwards) for a conspiracy against the conqueror; by whose order, also Ederic, another earl, who had delivered up York castle to Edgar Atheling, was committed prisoner for life to the castle of Winchester, and had his eyes bored out of his head. Giffard, his successor, seeing the continual quarrels betwixt the monks of the new minster and those of the old, removed the former to Hyde, in this neighbourhood, where he founded a stately abbey for them. He was buried in this church, in 1128. He was succeeded by Henry de Blois, who summoned a council of the clergy hither, on the death of king Henry I. and, being the Pope's legate, also cited king Stephen to another council here, and he appeared accordingly, but would not comply with the clergy's

terms; whereupon this bishop, with the archbishop of Canterbury, and other prelates, prayed him, on their knees, to have pity on the church; which the king promised, but was not so good as his word. In his war with the empress Maud, she possessed herself of this city and castle, where she was so frantically besieged, that, to facilitate her escape, a report was spread of her death, and she was carried out in a coffin. At this time the bishop's followers are said to have spoiled and burnt Winchester, together with the monastery, nunnery, and more than twenty, some say, forty churches. The bishop also, when he returned to Winchester, took off from the cross that was burnt in the monastery, five hundred weight of silver, thirty marks of gold, three crowns, with so many thrones of gold set with diamonds, which he put into his own treasury; and took enough out of it to found and endow the fair hospital of St. Cross, (about a mile to the south of this city) which is said, by mistake, in the *Magna Britannia*, to be founded by the cardinal de Beaufort, above two hundred years after. Bishop Godwin says, that something had been erected on the same spot, long before, to some good use (by William Rufus, as some say); but the Danes destroyed it, and it lay in ruins till this bishop rebuilt it, with two quadrangles, *anno* 1132, and endowed it with the revenues it now has. He built also the bishop's palace, called Wolfsey, at the east end of the church, which was adorned and fortified with several turrets, and almost surrounded with the river. About this time, king Henry II. held a parliament here, where he was crowned, with his queen. His successor, Richard I. who died here in 1189, was buried in the north wall of the Presbytery, under the tomb of Wina. His successor, Godfrey Lucy, son to Richard, lord chief justice of England, who was also governor of the castle, built the tower of the cathedral, and instituted a confraternity to collect alms for five years, and no longer, towards the repair of the church. In this bishop's time, king Richard I. granted a very ample charter to the citizens, that they should not plead without their walls, but in trials about tenures; that they should have no trials by duel; that they should be free from toll, lastage, pontage through all his territories by sea and land, &c. King John, to whose interest this place stood firm in all his wars with the barons, resided here; and his son, Henry III. was born here. Peter la Roche, who was bishop here at that time, and afterwards lord chief justice and protector of the kingdom during Henry's minority, died in 1238, and was, by his own appointment, buried very meanly, and even obscurely, in this cathedral. 'Tis remarkable, that in his time resided here Henry the Lion, duke of Bavaria, and his dutchess Matilda, daughter of Henry II. and in 1209, their younger son, William duke of Saxony, was born here, from whom descended the illustrious house of Hanover, now reigning in Great Britain. King Henry III. who kept his Christmas here in 1239, made sad havock of the temporalities of this bishoprick, because the monks chose Raleigh their bishop, instead of his wife's uncle. When the barons rose, this castle was seized by Simon de Montfort, the earl of Leicester's son, the city taken, and all the Jews in it put to the sword; but the earl of Leicester being soon after killed, king Henry came hither, and held a parliament. Ethelmarus, Raleigh's successor, was a Frenchman, who died in 1261, and his heart was interred in the south wall of the Presbytery; as was also that of his successor, Nicholas de Ely. The tomb of John de Pontifara, the next bishop but two, is in the north wall of the Presbytery. Soon after the murder of king Edward I. his uncle, Edmund Plantagenet, was beheaded at the Castle-gate here. William Edendon, bishop of this see, was so great a favourite of Edward III. that, being elected to Canterbury, he refused it, saying, 'If Canterbury is the higher rack, Winchester is the better manger.' When treasurer of England, he caused groats and half-groats to be coined, which wanted something of the just sterling weight; whereupon the price of things rose considerably. Upon this occasion, we meet with a remark in bishop Godwin, which, perhaps, will explain the doubts that arise in history, from the

cheapness of provisions said to be in ancient times. The bishop writes thus: 'Whereas, many other times, the like practice has been used, inasmuch that five shillings has now scarce so much silver in it as five groats had three hundred years ago; no marvel if things are sold for treble the price that they were three hundred years since.' By which it appears, that when we read in old history of a sheep being sold for a groat, we must understand it as good as twenty-pence at that time; and so for other things. This bishop was buried in a very fair alabaster tomb, on the south side of the entrance into the choir.

His successor, William, of Wickham, a village near this place, where he was born, sued bishop Edendon's executors for dilapidations; and, besides money, recovered of them one thousand five hundred and fifty-six head of black cattle, three thousand eight hundred and seventy-six wethers; four thousand seven hundred and seventeen ewes, three thousand five hundred and twenty-one lambs, and one hundred and twenty-seven swine; all which stock belonged, it seems, at that time, to the bishoprick of Winchester. He procured a charter for this city from king Edward III. to whom he was prime minister, by which it was made a wool-staple, a trade carried on here at this time with great success; by Mr. Selwood and company. In 1387, he laid the first stone of the college here, called St. Mary's, near the bishop's palace, and finished it in 1393, which was the year that king Richard II. held a parliament here. The warden and fellows entered into possession of it on the twenty-eighth of March, at three o'clock in the morning. The establishment of it appointed a custos or warden, seventy scholars, students in grammar; ten perpetual chaplains, now called Fellows; three other chaplains, three clerks, a school-master, usher, an organist, and sixteen choristers; who, with their tenants, were freed for ever from all toll, geld, scutage, &c. from all taxes and exactions whatsoever; and from granting any pensions, corradies and maintenance, to any one, at the command of the king, or his heirs. The allowance to the warden, masters and fellows, is very considerable; and they have handsome apartments joining to the college. The scholars wear black gowns; but, when they go to chapel, white surplices. King Edward IV. also confirmed to this college the alien priory of Andover, in this county, with all the lands, rents, &c. thereunto belonging. The said college consists of two large courts, in which are lodgings for the masters and scholars, and in the centre is a very noble chapel. Beyond that, in the second court, are the schools, with a large cloister beyond them, and some inclosures laid open for the scholars diversion. There is a large hall likewise for them to dine in. There are images finely painted on the glass of the college chapel-window; and in the middle of the cloisters is a library, a strong stone building, well contrived against fire. Over the door of the school is an excellent statue of the founder, made by Mr. Cibber, (father of Mr. Colley Cibber, that excellent comedian, the poet laureat) who cut those inimitable figures of Melancholy and Distraction over Bedlam-gate. Many learned and great men have been educated in this school, where the scholars have exhibitions after a certain time of continuance, if they have a mind to study in the New College at Oxford, built by the same noble benefactor. This bishop built all the body of his church, from the choir westward, (where his statue is placed in a nich, over the great window) excepting only a small part of it, begun by bishop Edendon. He likewise procured many privileges and immunities to be appendices for ever to this see, as particularly, that its bishops should be prelates of the most noble order of the garter, and chancellors to the archbishops of Canterbury. Besides divers other bounties, he bestowed twenty thousand marks in the repair of houses, mended all the highways from hence to London, and erected a stately tomb of white marble, richly gilt, thirteen years before his death, in the body of his church, where he lies interred, with the ensigns of the order of the garter, (of which he was the first prelate) joined with his episcopal robes, painted in their proper colours. 'Tis recorded of this William of Wickham, That having

having been born a poor boy, the king told him, when he applied to him for this bishoprick, 'That he was neither a clergyman nor a scholar;' and that he answered, 'He would soon be the one; and as for the other, he would, with the revenue of this bishoprick, make more scholars than all the bishops of England ever did.' And he was as good as his word; for as he built his college here to fit youth for the university, after the manner of Eton and Westminster schools, so he built New College at Oxford to finish them. He also built several free-schools and hospitals, both in Hampshire and Surry, which travellers may every where distinguish by this motto on his arms affixed to the structures, viz. *Manners make the man.* He likewise built the castle of Windsor for king Edward, and appears to have been an able architect.

King Henry IV. was married in this city to the widow of the duke of Bretagne. It appears by the parliament rolls in his reign, that Winchester was held of the king in fee-farm, paying one hundred and twenty marks a year, and that some of it was held in capite.

In this city king Henry V. gave audience to the French ambassadors, who came to beg a peace of him; but they did it in such insolent terms, that he soon after invaded and conquered France. The bishop of this see at that time was that king's uncle, Henry de Beaufort, son of John of Gaunt, duke of Lancaster, whom pope Martin V. made a cardinal, and general of the forces which he had raised at his own expence to act against the Bohemians. He built and endowed an hospital in this city, near to St. Cross's, wherein were to be maintained a master, two chaplains, thirty-five poor men, and three women. He died *anno* 1447, and lies buried in a fine tomb behind the altar of his church, towards the south, on which he is represented in his cardinal's robes and hat, and bearing the same arms as the present duke of Beaufort. He was thrice lord chancellor, and so wealthy, that he was commonly called, *The Rich Cardinal.* He left legacies to almost all the cathedrals in England, but most to that of Wells. 'Tis observable, that this bishop, his predecessor, and his successor William Waynsfleet, (as he was called from the place of his birth in Lincolnshire, though his true name was Patten) sat in this see almost one hundred and twenty years; a thing very rare, for three bishops to hold one bishoprick so long! In 1486, Arthur, eldest son to Henry VII. was born in this city; the same prince, whose name, after his death, came very often on the stage, on account of his widow, the princess Catharine of Spain, being married to and divorced from king Henry VIII. Bishop Waynsfleet, who died this year, lies buried in the north part, beyond the high altar, over-against the cardinal, in a very fair tomb, richly gilt, on which he is represented lying at length, with a heart in his hand. 'Tis kept in repair by Magdalen-college, Oxford, of which he was founder. His successor, Peter Courtenay, who died in 1492, was also buried in this church, and succeeded by Thomas Langton, who built a neat chapel on the south side of Our Lady's, in this cathedral, in the midst whereof lies his body in a stately tomb of marble. His successor, Richard Fox, covered the choir here, together with the Presbytery, and the isles adjoining to it, and built the partition between them, causing the bones of such princes, prelates, and great men, as had been dispersed about the church in the civil wars, to be put into large wooden chests lined with lead, and again interred at the foot of the great wall of the choir, with inscriptions denoting them to be the bones of king Ulse, Kinulphus, Egbert, Edmund, Canute, and queen Emma, William Rufus, and his brother Richard. This bishop lies buried on the south side of the high altar, in a fair monument of the same building with the partition.

In 1554, queen Mary was married in this city to Philip of Spain, and the chair used in that ceremony is still kept. That cruel, revengeful prelate, Stephen Gardiner, bishop of this see in her reign, died in 1555, at Whitehall, from whence his corpse was brought hither in great pomp, and buried on the north side of the high altar, in a tomb, which felt the rigour of the enemies of his hated memory in the last civil war. In this church also, its

bishop Horn, and his successor Watson, were buried; the former under a marble monument near the pulpit; as was bishop Cooper, (author of a great dictionary, *Thefaurus*, which bears his name) on the south side of the choir, a little above the bishop's seat, under a flat marble stone, with an inscription both in prose and verse. Walter Curl was bishop of this city, when it was besieged by the parliament army under Sir William Waller, who took it in December 1643. In his time lived here Mr. Trussel, who, after having been bred at Winchester school, became a trader, and alderman, and such an author too, that he continued Daniel's history of England, wrote a history of all its bishops and bishopricks to his time, and a particular description of this city, and occurrences therein, besides the origin of cities in general. The bishop's palace here having been pulled down in the civil wars, bishop Morley, who had been in exile with king Charles II. laid out two thousand three hundred pounds in building a new one; and, when he died, left five hundred pounds more to finish it. In 1672, he erected a college in the cathedral church-yard for ten ministers widows, and endowed it with a good yearly revenue. In his time king Charles II. set Sir Christopher Wren to begin the royal palace in the high part of this city, where the old castle stood. The front, next to the city, was carried up to the roof, and the whole case was roofed; but dying before it was finished, nothing remains of it except the model. It fronts the city by a noble area between the two wings, which were to have each sixteen spacious rooms, and a chapel. There were particularly intended three cupolas, of which one was to be very large, and thirty feet above the roof, which would have been seen a great way in the channel; and also a fair street of houses, leading in a direct line to the cathedral; but 'twas never begun, though the ground for the same, and the park, which was to be near eight miles in compass, were actually procured, and marked out. The south side is two hundred and sixteen feet, and the front, to the west, three hundred and twenty-six. What is done of it is said to have cost twenty-five thousand pounds. In a word, never was a situation better designed by nature for a royal palace. King Charles II. and king James II. made several progresses to this city, especially while the palace was building; and queen Anne also visited it soon after her marriage with prince George of Denmark, on whom it was settled as an appenage for his life, in case he had outlived the queen. His late majesty made a present to the duke of Bolton of the fine pillars of Italian marble, which were to have supported the stair-case, going up to the grand guard-room. Bishop Morley dying at Farnham in 1684, his corpse was brought hither, and interred in a little vault in the cathedral, between two pillars, opposite to those between which bishop Edendon lies buried at the foot of the ascent to the choir on the north side. Soon after, an altar tomb was erected over his body, and an inscription put upon it, which he made for himself. The late bishop, Sir Jonathan Trelawney, having called for the money left by bishop Morley, wainscotted and fitted up the greatest part of the inside of the palace in a very handsome manner. It stands partly over-against the warden's garden, with a road between them; and its gardens join the dean's, near the cathedral.

The cathedral, as has been partly observed, was anciently called the *Ealden Minster*, or *Old Monastery*, to distinguish it from the more modern one, *Newan Minster*, the new monastery founded by king Alfred, who, to build the offices belonging to it, bought a certain piece of ground of the bishop, for every foot of which he paid a mark, according to the public standard. This new college, as well as the old one, was founded for married priests, who were afterwards expelled by Dunstan, archbishop of Canterbury. The walls of these two monasteries were so near, that any noise in the one was a disturbance to the other; and quarrels thereupon ensuing, the separation followed, which has been already mentioned; whereupon the monks of the new minster, by licence of Henry I. built a large and beautiful monastery at Hyde, which, says Camden, was, by the treachery of the bishop Henry de Blois, burnt down, within

within a few years, by a fire, wherein that famous cross above-mentioned was consumed, the gift of Canute the Dane, which cost him the yearly revenue of all England; but 'twas raised again to a noble fabric, and flourished till the dissolution, when it was demolished; and the other, dedicated to the Holy Trinity, which is now the cathedral, upon the monks being ejected, had a new foundation of a dean and twelve prebendaries. 'Tis a large pile, and has a venerable look, but is not very elegant. Instead of a steeple or spire, it has only a short tower covered flat, as if the top of it had fallen away, and it had been covered in haste to keep out the rain. The most remarkable things in it are, 1. The font erected in the time of the Saxons: 'tis of large square black marble, supported by a plain stone pedestal; and the sides are set off with basso-relievos, representing the miracles of some saint belonging to this church. 2. The ascent to the choir, by eight stately steps, at the top of which are two copper statues finely cast, viz. that of king James I. on the right, and king Charles I. on the left. 3. The bishop's throne, of which the pediment is adorned with a mitre, and the arms of the see supported with fluted columns of the Corinthian order. 'Twas given by bishop Trelawney, who, when he fitted up his palace, had a view of residing here every summer. 4. The stalls of the dean and prebendaries, adorned with spire-work gilded, before which stands an eagle with expanded wings, on a brass pedestal. 5. The ascent to the altar, which is of marble steps. The pavement is very curious, being inlaid with marble of divers colours, in various figures. 6. The altar-piece, which is by much the noblest in England, if not in all protestant countries, and the gift of bishop Morley. 'Tis a lofty canopy of wood-work, projecting over the communion-table, like a curtain, with gilt festoons hanging down from it, and beautified all over. The communion-rail is neat, and on each side of the altar run up vases of stone, with golden flames issuing out to the roof of the church, with excellent foliage. 7. The great east window, very remarkable for the antiquities finely painted on its glass, which contains the portraits of several saints and bishops of this church, and is still intire; as is also the west window, but not of so fine workmanship. The dimensions of the cathedral are thus set down by Mr. Willis, in his *Mitred Abbies*. Length of the whole, from east to west, five hundred and forty-five feet, including the Lady-chapel at the east end, which is fifty-four feet, whereof the choir comprehends one hundred and thirty-six feet in length, and forty in breadth. The body and side-ises are eighty-seven feet broad; length of the great cross-isle about one hundred and eighty-six feet, and of the tower in the middle, in which hang eight large bells, about one hundred and fifty feet. The nave, or western body of the church, extends above three hundred, and is reckoned the most spacious in England; and indeed, the whole fabric would yield to few or none, were the great cross-ises vaulted over, in like manner with the rest of the structure; and were the great tower in the middle, (which would well bear a superstructure) raised a little higher, with some ornament at the top, to render it more august. The choir is said to be the longest of any in England. The roof of it, with the coats of arms of the Saxon and Norman kings, was the gift of bishop Fox. Just under the altar lies a son of William the Conqueror, without any monument; but there is a very fine one, under which lies the famous earl of Portland, who was lord high treasurer of England in the reign of Charles I. His effigies is in copper armour, at full length, with his head raised on three cushions of the same. On the south side of the nave is a marble statue of Sir John Cloberry, who, from being a private musketeer, raised himself first to knighthood, and had a good estate given him by Charles II. for his fidelity in the secret of the restoration, when he was employed as a messenger between general Monk and those intrusted by that king. The clergy here live very elegantly in the close belonging to the cathedral, in pleasant handsome dwellings, particularly the deanry, which has large gardens, and the river running through them;

but they are therefore often intremoded by floods. There were formerly in this city thirty-two parish-churches, of which but only now remain.

An infirmary was some years since established here by voluntary subscription, procured chiefly by the Rev. Dr. Alured Clarke.

The buildings, in general, are mean; but the streets are broad, and the situation healthy and pleasant, it being in a valley between two very steep hills, which defend it from cold and boisterous winds. The river Itching, which runs by the walls of it, was made navigable in the reign of William the Conqueror, as we have already observed. The city is almost intirely surrounded by a wall of flints, and is about a mile and a half in circumference. In the wall are six gates, with suburbs leading to every one of them. There is a great deal of void ground within the walls, which is turned into gardens, supplied with water from small canals on each side of the high-street. Joining to the east gate is a very elegant house, built in the form of the queen's palace in St. James's Park, with iron gates before, and a spacious garden behind it. Near it is St. John's hospital, in the hall of which the mayor and bailiffs give their public entertainments. At one end is the picture of king Charles II. by Sir Peter Lely; and at the other, a large table, containing all the mayors and bailiffs of this city from the year 1184. There are also tables of the benefactors to the city during the reign of the Saxons, and from the reign of Henry II. to that of Charles II.

This city is governed, according to a charter of queen Elizabeth, by a mayor, a high-steward, a recorder, an unlimited number of aldermen, (out of whom are chosen six justices) two coroners, two bailiffs, twenty-four common-councilmen, four constables, and four serjeants at mace. The corporation have a guild-hall, rebuilt some years ago, in the high-street, having the statue of queen Anne placed in the front of it. In this hall two courts of record are held every Friday and Saturday.

Here are three charity-schools, one for fifty boys, and another for thirty girls, who are all clothed, and, when of a proper age, are put out apprentices. These schools are maintained by a subscription, amounting to two hundred and twenty pounds a year. The third school, which is supported by the bounty of one person only, is for teaching two hundred and fifty boys, who are neither clothed nor put out apprentices. In the cathedral church-yard is a college, erected by bishop Morley in the year 1672, for ten widows of clergymen.

In this city the Romans had looms to weave cloth for the emperors, and their army; and king Athelstan granted it the privilege of six mints for the coinage of money. Near the west-gate of the cathedral there is still some part of an old wall, very thick, with several windows in it, built of small flints cemented by mortar as hard as stone, and supposed to have been a work of the Romans. The great Roman highway leads from this city to Alton, and, it is supposed, was continued to London; but the remains of it cannot now be traced beyond Alton.

A monastery is said to have been founded here very early by Lucius, a British king, for monks following the rule of St. Mark, which, after several changes, was at last totally demolished by one of the West Saxon kings.

In the east part of the city a nunnery was begun by king Alfred, or his queen Alswitha, about the end of the ninth century, and finished by their son king Edward the elder. This house was also new-modelled and enlarged by bishop Ethelwold. The nuns were of the Benedictine order, and the house was dedicated to the Virgin Mary, and St. Edburg, daughter to king Edward, who was herself a nun, and, some say, abbess here. The yearly revenue of this abbey, in the twenty-sixth year of Henry VIII. was one hundred and seventy-nine pounds, seven shillings and two-pence; and three years after, when it was dissolved, the king granted pensions to the abbess and twenty-one nuns.

medicines nunnery, to atone for her having murdered her first husband, Ethelwold, that she might be queen; and her son-in-law, king Edward, that her own son, Etheldred, might be king. It was dedicated to the Holy Cross and St. Peter; and in this abbey she is said to have spent the latter part of her life very penitently. At the general suppression, it was endowed with revenues amounting to three hundred and thirty-nine pounds, eight shillings and seven-pence *per annum*. There is still an annual fair held at Wherwell on the fourteenth of September, for sheep and bullocks.

About six miles to the north-east of Andover, is the town of Whitchurch, situated on the western road, on the banks of the Teste, fifty-eight miles from London. It is an ancient borough by prescription, and governed by a mayor, chosen annually at the court-leet of the dean and chapter of Winchester, to whom the manor belongs. The members to represent this borough in parliament, are chosen by the freeholders, and returned by the mayor. The principal trade of this town consists in shalloons, serges, and other articles of the woollen manufacture.

Whitchurch sends two members to parliament, has a weekly market on Friday, and four annual fairs, viz. the twenty-third of April, the twentieth of June, and the seventh of July, for toys; and the nineteenth of October for sheep.

Kingsclere, which was the next place we visited, is pleasantly situated on the downs bordering on Berkshire, fifty-two miles from London. It was once the seat of the Saxon kings of this county, but has now nothing remarkable, except its being still the capital of a hundred. Here is a weekly market on Tuesday, and three annual fairs, viz. the first Tuesday in April, the first Tuesday after Old Michaelmas-day, and the tenth of October, for sheep.

From Kingsclere we continued our journey to Silchester, a hamlet, consisting of only one farm-house and a church, situated seven miles to the north-east of Kingsclere, upon the borders of Berkshire. Here are to be seen the remains of the celebrated Vindomia, or Vindonum, of the Romans, and the Caer Segont of the Britons, once the chief city of the Segontiaci; and said to be built by Constantius, the son of Constantine the great, who is reported to have sown corn in the trace for the walls, as an omen of their perpetuity. These walls, which are two Italian miles in circumference, and built of flint and rag-stone, are still standing. They were surrounded by a ditch, which is still impassible, and full of springs. At the distance of five hundred feet without these walls, to the north-east, are the remains of an amphitheatre, which has long been a yard for cattle, and a watering-pond for horses. In this place several Roman roads, which are still visible, concur; and in the neighbouring fields a vast number of Roman coins, bricks, and other relics, are daily found; among the rest was a stone, with the following inscription: MEMORIÆ FL. VICTORINÆ T. TAM. VICTOR CONIVX POSVIT; and some coins of Constantine, on the reverse of which there is the figure of a building, and this inscription: PROVIDENTIAE CAESS. Some British coins are also found here, which the common people call Onion Pennies, from one Onion, whom they will have to be a giant, and an inhabitant of Vindomia.

Leaving Silchester, we travelled directly south to Basingstoke, an ancient town situated on the western road from London to Wiltshire, forty-eight miles from London. It is a large and populous town, governed by a mayor, a recorder, seven aldermen, seven capital burgeses, and other officers. Besides the parish-church, there was a very neat chapel, built in the reign of Henry VIII. by William, the first lord Sandys, who was buried in it. This chapel stands on an eminence, but is now in a ruinous condition. The history of the prophets, apostles, and the other disciples of Christ, was finely painted on the ceiling. Here are three charity, and one free-school, in which forty-four boys and twenty-four girls are taught and clothed. One of the above schools belongs to the skinners company in London,

and in it twelve boys are taught, clothed, and maintained. Great quantities of malt are made here, and some years ago, a manufacture of druggets and shalloons was set up in this town, and has since been carried on with success, and affords constant employment for a great number of poor people.

Henry III. founded an hospital here in 1261, for the maintenance of aged and helpless priests, pursuant to the will of Walter de Merton; and after the foundation of Merton College in Oxford, the scholars, or fellows of that college, who should become proper objects, were to be preferred. It was dedicated to St. Mary and St. John the Baptist, and the mastership of it very early annexed to the wardenship of Merton-college, Oxford. A bloody battle was fought near this place in the year 871, between Etheldred and the Danes, in which the former was defeated.

Here is a large weekly market for corn, especially barley, held on Wednesday; and two annual fairs, the first held on Wednesday in Whitsun-week, for pedlars ware; and the second on the tenth of October, for hiring servants, and the sale of cattle.

Besides these fairs, there are two others held on the neighbouring hills, called Basingstoke-downs, on Easter Tuesday, and the sixteenth of September, for the sale of cheese and cattle.

In the neighbourhood of Basingstoke is a house built out of the ruins, and on the site of old Basing-house, a seat belonging to the marquis of Winchester, and famous in the great civil war. The marquis, who was a firm loyalist, changed this seat into a fortress for the king; and having under him a band of veteran soldiers, held it out for a long time, to the great annoyance of the parliament army. At last Cromwell, provoked to see a house defy all their efforts, when the strongest cities had submitted, took it by storm, put great part of the garrison to the sword, and burnt the house to the ground. It was a building more proper for a prince than a subject; and, among other rich furniture destroyed with the structure, was one bed worth fourteen hundred pounds; but notwithstanding this, the plunder was so considerable, that a private soldier had three hundred pounds to his own share.

About five miles to the eastward of Basingstoke, is a town called Odiham, situated on the road to Basingstoke, forty-one miles from London. It is a corporate town, and was formerly a free borough belonging to the bishop of Winchester. It had once a royal palace and a castle, which, in the reign of king John, was defended for fifteen days by only thirteen men, against the army of the barons; and in the reign of Edward III. David III. king of Scotland, was kept a prisoner here. A charity-school for thirty boys was founded here about forty years ago, by a tradesman of this town, who left the interest of six hundred pounds to support it.

Here is a weekly market on Saturday, and two annual fairs, viz. Mid-lent Saturday, and the thirty-first of July, both for toys and cattle.

At Wintney-hartley, about four miles to the north-east of Odiham, a Cistercian nunnery was founded by some of the Colrish family in the reign of William the Conqueror. It was dedicated to the Virgin Mary and Mary Magdalen, and, at the dissolution, it was inhabited by a prioress and seventeen nuns, with a revenue of forty-three pounds three shillings *per annum*.

From Odiham we directed our course to Alton, and passed through a small place called Bentley-green, one of the most lively and cheerful villages we met with in our journey. The houses are, in general, well-built, though small, scattered at proper distances, and have all little gardens, neat, and well planted. The fences on each side of the road, for many miles together, are of white-thorn of the most vigorous growth, many of them clipped, and all kept clean from weeds. Nor is this husband-like attention confined to their fences on the road-side; it extends into the fields as far as we could see.

Alton is a pretty, though small market-town, situated on the road leading from London to Winchester, fifty miles from the former. Here is a charity-school for forty boys and twenty girls, but nothing else worth the attention

attention of a curious traveller: The weekly market is held on Saturday; besides which, there is an annual fair on the twenty-ninth of September, for cattle and toys.

At West Sherborn, in the neighbourhood of Alton, there was a priory of Benedictine monks, dedicated to St. Mary and St. John, which became a cell to the abbey of St. Vigor at Cerisy in Normandy, to which it was given by Henry de Port, one of the barons of the exchequer in the reign of Henry I. It was afterwards given by Edward IV. to the hospital of St. Julian in Southampton, and is now enjoyed by the provost and fellows of Queen's College, Oxford, as masters of that hospital.

There was also a priory of black canons at Selbor, near Alton, founded by Peter de Repibus in the year 1233, and dedicated to the Virgin Mary; but it was suppressed, and granted to William Wainfleet, bishop of Winchester, who made it part of the endowment of St. Mary Magdalen college in Oxford.

Alesford, or Aylesford, the next place we visited, is situated on a river formerly called the Alre, now the Itching, sixty miles from London. It is an ancient town, governed by a bailiff and eight burgesses. On the first of May 1610, this town was consumed by an accidental fire, which broke out in several places almost at the same time, sparing neither the market-house nor church. It was soon after rebuilt in a much better manner than before, and the market-house, and many of the private houses, are of brick, which before were of timber and plaster. Since which time, it has suffered two other accidents of the same kind, but is now handsomely built. Part of the Roman highway, leading from this place to Alton, serves for the head or flank of a large pond, in which there are a great number of swans. Here is a weekly market on Thursday, and an annual fair on the twenty-fourth of June, for sheep, horses, and cows.

About eight miles to the eastward of Alesford, is Petersfield, an ancient borough-town, situated on the road leading from London to Portsmouth, fifty-five miles from London. It stands in a pleasant, fruitful soil, abounding with oaks, and is accommodated with several good inns. It is governed, according to a charter of queen Elizabeth, by a mayor and commonality, who have shamefully given up all their privileges to the family of the Hamborrows, who are lords of the manor, at whose court the mayor is annually chosen. The church, though pretty large, is only a chapel of ease.

Petersfield sends two members to parliament, has a weekly market on Saturday, and two annual fairs, viz. the tenth of July, and the eleventh of December, for sheep and horses.

From Petersfield we directed our course towards Southampton, and passed through Fareham, a small market-town situated at the upper part of Portsmouth harbour, sixty-eight miles from London. It is pleasantly situated, has a market on Wednesday, and an annual fair on the twenty-ninth of June, for toys.

About two miles to the north-east of Fareham, is a small town called Southwick, remarkable for having been the residence of colonel Norton, who dying in December 1732, left a real estate of six thousand pounds a year, and sixty thousand pounds in money, to the poor, hungry and thirsty, naked and strangers, sick, wounded, and prisoners, to the end of the world. He left his pictures, and other valuable effects, to the king, and appointed the parliament of Great Britain his executors; but in case they should refuse the trust, it should devolve to the bishops. Trustees were soon appointed, by proper authority, to take care of this extraordinary legacy; but the will carried such strong marks of insanity, that it was afterwards set aside. The house, which is very large, is part of a monastery built by Henry I. The situation is very low and wet, having a great deal of marshy ground about it; but the park extends to the highest part of Portsdown, where there are two large clumps of Scotch firs, planted by the colonel, which have flourished remarkably, and may be seen near twenty miles at land, and a considerable distance at sea. And from the ground near these trees, there is a very

beautiful view of Portsmouth, town, harbour, and docks; the roads of Spithead and St. Helens, and the Isle of Wight. On the land-side the eye commands a very extensive vale, well planted and cultivated, bounded with hills clothed with woods.

About seven miles to the northward of Fareham is Waltham, or Bishops Waltham, from a palace the bishops of Winchester had formerly here, sixty-five miles from London. It is a considerable market-town, and has a charity-school, but nothing else remarkable. The weekly market is held on Saturday. There are also four annual fairs, viz. the second Friday in May, for horses and toys; the twenty-fourth of July, for cheese and toys; the first Friday after Old Michaelmas-day, and the tenth of October, for horses, stockings, and toys.

About three miles to the northward of Waltham is a small town called Warnford, in the church of which are two remarkable inscriptions; one upon the north side, indicating, that this church was rebuilt by Adam de Portu, a man of great wealth in the time of William the Conqueror. The inscription is as follows:

*Addæ hic Portu, benedicat solis ab ortu,
Gens Deo dicata, per quem sic sum renovata.*

The other inscription, on the south side, intimates, that this church, which was rebuilt by Adam de Portu, was founded by Wilfred.

*Fratres orate, præce vestra sanctificatè
Templi Façtores, seniores & juniores,
Wilfrid fundavit, bonus Adam sic renovavit.*

Southampton, the next place we visited, is a large borough-town situated between the Alre, or Itching, and the Tese or Anton, both of which fall here into an arm of the sea called Southampton-water, seventy-eight miles from London. It was first incorporated by Henry II. and made a county of itself by Henry VI. which renders it independent of the lord lieutenant of the shire: According to the last charter, which was granted by king Charles I. the corporation consists of a mayor, nine justices, a sheriff, two bailiffs, twenty-four common-councilmen, and as many burgesses. The mayor is admiral of the liberties from South-sea castle, situated on the east side of Portsmouth harbour, to Hurst-castle, erected on a neck of land opposite the needle-cliffs in the Isle of Wight.

This town was terribly harrassed by the Danes, who at length took it in the year 980; and here it was that Canute the great convinced his courtiers of the limited power of earthly monarchs. These flatterers had often addressed him with the most fulsome compliments, even at the expence of the Divinity. Canute, despising such mean flattery, resolved, as an unanswerable argument to all they had been saying, to give them an ocular demonstration, that there was no more divinity about the person of a king, than about that of the meanest of his subjects: accordingly, he ordered his chair of state to be placed on the strand below the high-water mark, while the tide was flowing; and sitting in it, dressed in his royal robes, addressed the sea in the following manner: "Over thee, O sea, I have command, and the strand on which I sit is mine. Disobedience to me never goes unpunished. Upon thy peril, therefore, advance no farther, nor presume to wet the feet of thy sovereign lord." But the waves, deaf to the royal voice, rolled on in their usual course, first sprinkling, and then dashing all over the royal person. Canute, as if surprized at the disobedience of the element, started from his seat; and after chiding his courtiers for flattering him into a belief of his power, that might have proved fatal to his person, represented to them the narrow limits of earthly majesty, compared to that which can bind the ocean, and say to the billows. "Thus far shall ye go, and no farther." He then, by way of penance for his presumption, walked home, wet as he was; and our historians add, that from that hour he would never more wear his crown, commanding it to be placed on the head of the crucifix at Winchester.

In the reign of Edward the third, Southampton was taken by the French, who, after putting the men to the sword and ravishing the women, laid the town in ashes; but was soon after rebuilt in a more convenient situation, and fortified with double ditches, and strong walls, with battlements and towers. The security of the place soon rendered it populous, and Richard II. built a strong castle on a high mount, for the defence of the harbour.

When Henry V. made his first expedition to France, he mustered his army here, and having discovered that he was in danger of being betrayed by Richard earl of Cambridge, lord Scroop, and Sir Thomas Grey, he caused them to be beheaded, and their remains interred in the chapel of God's House, an hospital founded by Phillippa wife to Edward III. for the maintenance of poor men and women.

This town is at present surrounded by a wall built of very hard stone, resembling those little white shells, like honey-combs, growing on the backs of oysters. These stones seem to have been gathered on the sand below the high water mark of the sea, which encompasses almost half of the town, and so deep, that ships of five hundred tons burden, have been often built here. At the south corner near the quay, is a fort called the tower with some cannon mounted on it; on one of which was an inscription, indicating that the fort was erected by Henry VIII. in the year 1542.

In order to break the force of the waves, which, in stormy weather, and southerly winds dash with great violence against the shore, they build a strong bank with a species of marine plant, called, in this part of the country, sea-ore. It is composed of long, slender, and strong filaments, like swingled hemp, very tough and durable. This bank is said to be a better defence than a stone wall, and, some add, than even a natural cliff; but the latter assertion seems to be too much exaggerated to gain belief with the thinking part of mankind.

The principal street, is one of the broadest in England, and near three quarters of a mile in length, well paved, and terminated at the southern extremity by a very commodious quay. Here is a public hall in which the assizes are frequently kept. There are also here five churches where the service is performed in English, and one, where it is read in French.

The hospital already mentioned, called God's house, is still in being, and also a free-school founded by Edward VI. A charity school was also opened in the year 1713, for thirty boys, who are clothed and taught, reading, writing, arithmetic, and navigation.

Southampton is said to have formerly enjoyed the sole privilege of importing all the Canary wine brought to England, and there are still many large vaults near the quay and in the High-street, where these wines were deposited; but the merchants of London suffering great inconveniences by this delay, purchased an exemption, and had their wines brought directly to London. Camden says it was famous in his time, for the great resort of merchants, the number and neatness of its buildings, and the wealth of its inhabitants. But it has now lost the greater part of its trade, though some is still carried on with the islands of Guernsey and Jersey, and to Newfoundland.

Some years since, the custom of bathing in the sea-water came into great request, and several baths were made here for that purpose. This convenience has proved of the greatest service to the town, great numbers of the nobility and gentry resorting hither in the summer season for that purpose. A very elegant ball and assembly room has been also lately erected here, and a most elegant pile of building was some time since begun, to accommodate the nobility, &c. with more commodious lodgings.

The inhabitants of Southampton, have been, for a long series of years supplied with excellent water, from several springs in the neighbourhood. The water is conveyed by leaden pipes to four public conduits erected in the town, and also to a large pond for watering cattle, near the east gate. This water is of the greatest service to the town, as well as to the ships trading hither, as that supplied by pumps in the place is brackish, from the

vicinity of the sea. The charge of repairing these conduits, pipes, &c. had been from time immemorial defrayed by the inhabitants; but some years since several of them refused to pay those rates, and the voluntary contributions of the more public-spirited persons being insufficient for the purpose, the conduits and other works, were in so decayed a condition, that a scarcity of fresh-water ensued, and a total want of it was likely to follow. This induced the inhabitants to apply to parliament for power to levy rates sufficient to answer all the good purposes desired; and accordingly an act passed in the session of 1746-7, which will, it is hoped be a means of continuing, to future ages, the salutary benefit the town was in so much danger of losing, by the narrow spirit and perverseness of persons, who were willing to receive an advantage, without contributing to support the method of procuring it, in common with their neighbours,

Southampton sends two members to parliament, has weekly markets on Tuesday, Thursday, and Saturday, and two annual fairs, viz. the twenty-fifth of April, and Trinity-monday, for horses, cattle, and leather.

At the hamlet of St. Mary's, a little to the north-east of Southampton, stood an old Roman town, called Clausentum, which in the ancient British language implies, the port of Entum. The ruins of this town may still be traced, as far as the haven on one side, and beyond the river Itching on the other; and the trenches of a castle, half a mile in compass, are still visible in St. Mary's field. This castle is supposed to have been one of the forts frequently erected by the Romans to keep out the Saxons.

About a mile from the town, on the banks of the river Itching is a vast pile of earth, which rises in the form of a cone, from a foundation of great circumference, called Bevis-mount. It is supposed to have been an ancient fortification thrown up by the Saxons, under the command of Bevis, to oppose the passage of the Danes over the Itching, when they lay encamped on the other side of that river. The mouth of the river Itching, is not very broad, but the tide running up it a great way above Southampton, forms a kind of bay, just under this remarkable mount; which being contiguous to an estate belonging to the late earl of Peterborough, his lordship purchased it, and converted it into a kind of wilderness, cutting various spiral walks and labyrinths through the woods and bushes with which it was covered, in so pleasing, but intricate a manner, that it is hardly possible for a stranger to find his way. His lordship used frequently to divert himself by dropping his friends in the midst of this wilderness, and, stealing away, leave them to wander up and down, till they found their way out of it. The mount, like what the poets fabled of Parnassus, terminates above, in a kind of fork; and between the two spires is a bowling green, or parterre, adorned with beautiful statues of Italian marble, brought by his lordship from Rome. The view towards the river is entirely open, and, when the tide is up, affords a very beautiful prospect. On one side of this parterre, declining gradually towards the south, from the top of one of the spires to the bowling green, is a little vineyard; and on the summit of the other spire, a beautiful summer-house is erected. It is built in an elegant taste, and has under it a very good cellar, where his lordship kept his wines, there being no good cellarage at his house, which stands near a quarter of a mile from the mount. He intended to rebuild the house, and convert all the ground lying between it and the mount into gardens; but death intervened, and terminated at once the design and his life. The beauty of the improvements which his lordship made in this mount, can hardly be conceived. He adorned it with statues, grottoes, and alcoves; and at every bend of the walks, something new and unexpected, strikes the eye of the spectator.

On the east side, about three miles down the river, are the ruins of the once celebrated Littlely, or Nettleby-abbey; the church of which is still so entire as to have part of the roof standing. It appears to have been very capacious, and built in the form of a cross; great part of the walls are covered with ivy, many of the stems of which are remarkably large. Mr. Willis, in his history of Mitred Abbeyes, tells us, that in the year 1704, the

roof was entire, but soon after pulled down, together with great part of the walls, by a person who had purchased the property of the abbey. Besides the church, there are still several rooms remaining, sufficient to shew how fine an edifice this once was, and which still, though in ruins, exhibits a very venerable appearance. Round the whole are large mounds, part of which kept up the banks of fish-ponds, whose overflowings were conveyed to a fort on the banks of the river, supposed to have been erected as a defence to the abbey.

This edifice was built in the year 1239, by Henry III. who placed in it Cistercian monks, and dedicated it to St. Mary and St. Edward. At the dissolution, it had an abbot and twelve monks, whose revenues were valued at one hundred pounds, twelve shillings and eight-pence *per annum*.

Henry V. built a priory for black canons upon the banks of the river Itching, about two miles above Southampton, and dedicated it to St. Dionisus, about the year 1124, in which were a prior and nine religious, whose revenues, at the dissolution, amounted to eighty pounds, eleven shillings and six-pence *per annum*.

Having viewed every thing curious in the town and neighbourhood of Southampton, we left that place, in order to visit Portsmouth, the strongest, and indeed the only regular fortification in this kingdom. In our road thither, we crossed the ferries of Itching and Busselton, and at the latter observed a man of war of sixty guns then building in a private yard.

About three miles beyond the ferry at Busselton, is Tichfield, a small place, but famous for an abbey built by Peter de Rupibus, who having obtained a grant of the manor from Henry III. erected this structure for Premonstrantian canons, in the year 1231, and dedicated it to the Virgin Mary. At the suppression, it was inhabited by an abbot and twelve canons, and endowed with the yearly revenue of two hundred and forty-nine pounds, sixteen shillings and a penny. Great part of the structure is still standing, and the south front of it changed into a modern building.

Leaving Tichfield, we passed on to Gosport, a town situated over-against Portsmouth, on the west side of the harbour, seventy-four miles from London. This town, though on a different side of the harbour, and in a different parish, generally goes by the name of Portsmouth, being considered, with regard to that town, as Southwark is with regard to London, except there being no bridge to unite them. Boats indeed are continually passing from one to the other. Gosport is a large town, and has a considerable trade: it is indeed chiefly inhabited by the officers and sailors belonging to the royal navy, and their wives; and travellers also generally chuse to lodge here, as every necessary of life is much cheaper here than at Portsmouth. A noble hospital has been lately built at Hasler, near this town, for the cure of the sick and wounded seamen in the service of the navy. Here is also a free-school, a weekly market on Saturday, and two annual fairs for toys, the first held on the fourth of May, and the second on the tenth of October.

Portsmouth derives its name from its situation at the port or mouth of a creek that runs up a part of the coast, which at high-tide is surrounded with the sea, and is therefore called Portsea Island. It is about fourteen miles in circumference, and is joined to the continent by a bridge a little above the town. At this bridge there was formerly a small castle, the ruins of which are still remaining, and a town called Port Peris, which is now known by the name of Porchester, and was then close upon the strand; but the sea retiring from Porchester, many of the inhabitants followed it; and settling below Port Peris, built Portsmouth.

This town is seventy-three miles distant from London, and is a borough, governed by a mayor, aldermen, recorder, bailiff, and common-council. In the reign of king Richard the second, the French burnt and destroyed Portsmouth; but it recovered so much in six years time, that the inhabitants fitted out a fleet, which beat the French at sea, as they were returning to insult the coast a second time, and then proceeded to France,

entered the river Seine, sunk several ships, and brought off a great booty.

Portsmouth may be called the Key of England, and is the only regular fortification. It was begun by king Edward IV. and augmented by kings Henry VII. and VIII. and queen Elizabeth was, at so great an expence in improving the works here, that nothing was thought wanting to complete them: but king Charles II. added very much to their strength, extent, and magnificence, and made this one of the principal harbours in the kingdom, for laying up the royal navy: he furnished it with wet and dry docks, store-houses, rope-yards, and all materials for building, repairing, rigging, arming, victualling, and completely fitting to sea ships of war of all rates. At this place all our fleets of force, and all squadrons appointed as convoys to our trade, homeward or outward bound, constantly rendezvous, and a thousand sail may ride here in perfect security.

The mouth of this harbour, which is scarce so broad as the river Thames at Westminster, is, upon the Portsmouth side, defended by a castle called South Sea Castle, built by king Henry VIII. and situated about a mile and an half south of the town. This castle is fortified with a good counter-scarp and double moat, with ravelins, and double palisades, besides advanced works to cover the place from any approach, where it may be practicable; but part of this fort was accidentally blown up, and greatly damaged, in August 1759. Besides the above castle, it is defended on this side by the guns on the platform, sally-port, and gun-wharf. The mouth of the harbour is, on the Gosport side, defended by four forts, and a platform of above twenty great guns, level with the water.

The harbour is capable of receiving the whole navy of England; and the depth of the water so great, that first-rates may ride at the lowest ebb without touching the ground: at the same time, it is sheltered from all winds, and forms one of the finest ports in Europe.

On the land-side, the town is defended by a regular fortification, having a glacis, covered way, and deep fosse, which can, in half an hour, be filled with water eight feet deep, ravelins, half-moons, &c. Within the fosse the wall is fifteen feet in perpendicular height, with a double parapet for small arms on the mount, which is planned out in bastions and curtains, the faces of one of the former regularly flanking those of the other.

These works have been lately continued round the dock-yard, by which means that amazing magazine of naval stores is sufficiently secured against any unexpected attack of an enemy.

The dock-yard is as convenient as can be imagined. It contains four large docks, each of which is capable of receiving two capital ships at a time; and such is the dexterity of the workmen, that five ships may be docked and cleaned every day, while the spring-tides continue, which is generally four or five days; so that twenty or twenty-five ships may be docked every fortnight.

Within the dock-yard are dwelling-houses, with ample accommodations for the commissioner, and all the subordinate officers and master-workmen, necessary for the constant service of the navy in this port day and night; and the contents of the yards and store-houses are laid up in such order, that the workmen can readily find any implement, even in the dark. The quantities of military and naval stores of all kinds that are laid up here, are immense. The rope-house is near a quarter of a mile long, and some of the cables so large, that one hundred men are required to work upon them at a time; and this labour, though divided among so many, is, notwithstanding, so violent, that the men can work at it only four hours in a day. The number of men continually employed in the yard is never less than a thousand. The docks and yards resemble a distinct town, and are a kind of marine corporation within themselves; having also a royal academy, where young gentlemen are properly educated to serve as officers in the royal navy. In one of the rooms of this academy is a very fine orrery, made by the late ingenious Mr. Rowley; and a most beautiful model of that unfortunate ship the *Victory*, which was built here

On the third of July 1760, a fire broke out in the dock-yard, which consumed the rope-house, the spinning house, the hemp-house, and one of the store-houses, with several stores, to the value of more than fifty thousand pounds.

The situation of this town being so near the level of the sea, it is full of ditches, which it was found necessary to cut as drains, and the inhabitants are very liable to agues. The streets are generally very dirty, and the inns and taverns are, in time of war, perpetually crowded with seamen and soldiers. The church of this town is a large and handsome building: a bell at the top of the church-tower is rung to give an account of the number of ships that enter the harbour; and from a watch-house at the top of the steeple, there is a fine prospect of the several ships in the harbour, as well as of those at Spithead, a channel between Portsmouth and the Isle of Wight, where ships generally ride before they come into the harbour, or after they sail out of it, and before they put to sea. The deputy-governor has a beautiful house, with a neat chapel, and there is a very fine new key, called the Gun-wharf, for laying up the cannon. This place is, however, in great want of fresh water; and though the adjacent country abounds with all sorts of provisions, yet the consumption of them at Portsmouth is so great, that they are very dear, and so also are lodging and firing. It is observed, much to the credit of the civil and military government of this place, that the military does neither corrupt the civil, nor the civil interrupt the military.

Portsmouth has so greatly increased, by a continual conflux of people hither, within these few years, that a suburb, called the Common, has been built, and is already larger than the town itself, and contains a greater number of inhabitants. The houses are also more elegant, and the streets wider and better laid out. At the same time, it is independent of the laws of the garrison, and not encumbered with the duties and services of the corporation.

Portsmouth sends two members to parliament, has two weekly markets, held on Thursday and Saturday, and one annual fair, called the Free Mart. It begins on the tenth of July, and holds fourteen days. It was formerly very greatly frequented by the inhabitants of the adjacent country, and large quantities of goods were yearly disposed of; but has greatly declined for some years past.

After having viewed every thing curious in Portsmouth, we passed over to the Isle of Wight, a place long famous, and which we were very desirous of viewing.

Account of the ISLE of WIGHT.

The Isle of Wight, though only a part of Hampshire, is so considerable for its trade, fertility and natural beauties, that it well deserves a distinct and particular notice. It is of an irregular, elliptical form, and lies so contiguous to the county of which it is a part, that the channel which divides it is in some places not two miles broad, and in none more than six or seven at high water. It is about twenty-four miles in length from east to west, twelve in breadth from north to south, and sixty in circumference. The whole island is divided into twenty-nine parishes, in which are four market-towns, four castles, about three thousand five hundred houses, and twenty-seven thousand souls.

The Isle of Wight was subdued by Vespasian about the year 45, and continued under the Roman government till that people quitted the island. About the year 542, the island was subdued by Cerdic, the first king of the West Saxons. Cerdic gave it to his two nephews, Stufe and Withgar, who put all the inhabitants to the sword, and peopled it with their followers, the Jutes and Saxons. The island continued subject to the West Saxons till about the year 650, when it was subdued by Wulphur, king of the Mercians, who, after converting Adelwalch, king of the South Saxons, whom he had taken prisoner, to christianity, he gave him the Isle of Wight. But Adelwalch did not long enjoy it; for in the year 685, it was invaded by Ceadwalla, king

of the West Saxons, who killed Adelwalch in battle, and this unhappy island suffered all the miseries of devastation. In the year 1012, king Etheldred was driven by Swain, king of Denmark, into this island, where he spent great part of the winter with a small retinue, and then sailed to Normandy, whither he had before sent his queen, and his two sons, Alfred and Edward. Harold, brother to Tofti, and son to the earl Godwin, landed here with some Flemish pirates, but retired, after raising heavy contributions on the inhabitants. Soon after William the Norman had conquered England, William Fitz-Osborne, then marshal of the kingdom, reduced this island, and was the first lord of it after the conquest. It has suffered more than once from invasions by the French, who, in the reign of Richard II. burnt some towns and villages, and besieged Carisbrooke-castle; but Sir Hugh Tyrrel, then governor of the island, forced them to raise the siege, and content themselves with one thousand marks of silver, which they had raised upon the inhabitants, by way of contribution. About the year 1403, a thousand French landed on the island, and seized a considerable number of cattle; but as they were driving them to their ships, the islanders fell upon them, killed two hundred, drove the rest to their ships, and recovered their cattle. Henry VI. erected the Isle of Wight into a kingdom; for he not only gave it to his favourite, Henry de Beauchamp, whom he had created first earl of England, and then duke of Warwick, with precedence before all other dukes, except Norfolk, but crowned him king of the islands of Wight, Jersey, and Guernsey, with his own hands. These isles did not, however, long enjoy their regal title; for Henry de Beauchamp dying without issue, they again reverted to the crown; and Edward IV. made Edward lord Woodville, his father-in-law, lord of the Isle of Wight, which grant was confirmed by Henry VII. but Woodville being disgusted at the king's refusing him leave to go to the assistance of the duke of Bretagne, withdrew privately to this island, raised four hundred men there, and sailed with them to Bretagne, where he was slain, with most of his men, at the battle of St. Aubin. In the reign of Henry VIII. two thousand French landed here, but were soon repulsed with great loss; which so enraged the French king, that he embarked an army to reduce the whole island; but hearing his troops were like to be opposed by an equal number, he gave over all attempts of this kind, as his successors have done ever since.

The government of this island, a post of the highest trust and honour, is always given to some person skilled in military or maritime affairs, or to one of the first rank. He has under him all the governors of the forts and castles in the whole island, where there is always one regiment in garrison, and sometimes more.

In ecclesiastical affairs, it is subject to the jurisdiction of the bishop of Winchester; and in civil, to that of the county of Southampton.

AIR, SOIL, and PRODUCE.

The air of this island is universally esteemed to be as pure and healthful as any in the kingdom; and the soil is so fruitful in its nature, and so skilfully and industriously managed by the husbandmen, that it has long since been allowed, that the annual produce of corn is sufficient for the inhabitants seven years; and so greatly have their arable lands been improved of late, that, in the opinion of many, the proportion at present is as one to twelve. The traveller, therefore, in these parts, will not be disappointed, if he expects to be entertained with the richest profusion of plenty, covering and adorning the face of nature; and, at the same time, he is agreeably presented with some of the finest and most extensive prospects of land and water which the eye can be regaled with. Through the middle part of the island, from east to west, there runs a continued ridge of spacious downs. The interior parts of these contain inexhaustible mines of chalk or marle, which is of infinite service to enrich and improve their lands. Upon the surface are bred vast numbers of sheep, which afford excellent

wool;

wool; but being little of it manufactured here, it is mostly bought up by the merchants and exported in the fleece to the cloathing parts of England. In passing along these downs you have frequently a delightful view of the sea, on both sides at once. The prospect to the South is continually varied by the opening of new vales, meadows, and ample corn fields; and on the north and north-east, besides woods and fields which vary the prospect on the island itself, you see Spithead, the towns of Portsmouth, Southampton, Lymington, &c. on the opposite shore. In short, the lover of the beauties of creation will here meet with the highest entertainment, and the landscape painter might both enrich his imagination and copy nature in her best attire.

Nor is the coast which encompasses this island destitute of its riches or natural curiosities. Here is excellent fishing of various kinds, particularly for mullets, bafe, &c. Though the method of using trawls, which of late years has prevailed, is no small diminution of their plenty, it being found by experience to destroy the spawn. But shell-fish, such as lobsters, crabs, prawns, &c. are taken in the greatest plenty and excellence.

The extremities of the land, especially on the southern coast, are for the most part a natural fortification of rocks and cliffs. There is only one place called Sandown, on the S. E. part, which lies open to the incursions of an enemy, and this is strongly fortified by art, and garrisoned with soldiers. The most remarkable of these cliffs are two; one of them an erect wall of rocky stone, which extends to some miles in length, is of a vast height and surprising regularity, considering it as a work of nature, and of a species wherein regularity for the most part is as little to be found as it is wanted. It has, therefore, very much the appearance of an old rampart, or castle wall, and as you view it a great way together, in a straight line as to length, and rising to its lofty height in a perpendicular direction, you would almost imagine it to be the off-spring of human labour in some ancient indefatigable age. What is further remarkable as to this cliff is, that it is at least half a mile from the water's side, and the intermediate land is as fine, level, and pleasant a tract as any in the whole island.

The other cliffs, which are among the more remarkable, are called Fresh Water cliffs, from a village of that name in the neighbourhood. They are prodigious promontories of chalk, of which we before noted the hilly parts of this island are composed. They rise to a stupendous height, and are the extreme boundaries of the shore on that coast which lies nearest to the west on the southern side. But what makes them to be one of the greatest curiosities in these parts, are the great number of exotic birds which annually resort to these cliffs to lay their eggs, hatch, and breed up their young. They are various both in colour and species, and are differently sized from the bigness of a pheasant to, perhaps, little more than a pigeon. At the firing of a gun, (a thing frequently done by such as go off in boats to view them) they fly round and over you in great numbers. Their food is fish, which they are incessantly flying off to procure for themselves and their young. The time of their coming (no-body knows from whence) is the latter end of March, or the beginning of April, and when their young are able to undertake the migration, which is some time in July, they all take their flight, and you see no more of them till the following season. The country people, for the sake of an advantage which they make by taking these birds, descend for that purpose by a rope fastened to an iron bar which is driven into the ground on the top of the cliff. Their method is to beat them down with a short stick as they fly in and out; and we were told, that a dozen of them will commonly yield a pound of feathers of a very delicate softness, the price of which to the merchant is eight pence, and their carcasses they sell to the fishermen for sixpence the dozen, to bait their crab-pots. And it was added further, that some of these peasants have been so dextrous as to take five or six dozen in a day: a considerable temptation to this adventurous work. We visited this place on account of the birds; and to get the better information, we consulted the farmer, whose house is not a mile from the place; he

assured us there were never more than three different sorts of birds, two of which are large, about the size of a duck, and the other small, some what less than a pigeon; and the lesser species were there all the year round; but the two largest went and came at stated times, as above related: these lay eggs of an unusual size, nearly as big as that of a goose, which the people of that part of the island eat; but they are no such fine coloured fowl, as they are usually represented: we saw several of them, but none more variegated than a common mallard or drake.

The village or parish of Fresh-Water is also remarkable for a curious silver-like sand, of which great quantities are dug and sent to London, Bristol, and other places to make the finer sort of glass wares. Upon this coast are also found copperas stones, of a good quality, and in such plenty, that vessels are often freighted with them to London. There are likewise beautiful shells and seaweeds, of the most curious ramification and colouring we have ever seen.

CITY, BOROUGHS, MARKET TOWNS, &c.

Newport, the capital, is seated on a rising ground near the centre of the whole island; and to make it the more convenient for commercial affairs, it has the navigable river Medina running close to its skirts, and emptying itself into the sea at four or five miles distance, at the harbour of Cowes. At this port there is a custom-house, at which many Carolina and Palatine ships usually clear. In this river are taken abundance of flat fish, and great quantities of the fattest and best flavoured oysters in the kingdom.—The air of Newport is lightsome and pleasant; and though the town is situated upon a gentle and agreeable eminence, yet it is so sheltered by the hills which encompass it at about a mile distance, that the cold is seldom felt to a degree of severity common to most other places. The streets are spacious, clean, and consequently sweet. These were at first evidently laid out upon a regular plan, consisting chiefly of three long ones, extending from east to west, and as many crossing them at right angles. They have been lately new pitched at a great expence; the foot-way on each side being elegantly paved and posted off, which affords a very handsome appearance, besides the pleasure of excellent walking. The buildings, though few of them grand, are neat and handsome, so that not many places, we believe, are more frequently visited by strangers, or with greater satisfaction.

Here are two weekly markets held on Wednesday and Saturday, though only that on Saturdays is worthy of notice. The great number of waggons, drawn by stately teams of horses, which are seen at this market, must needs attract the observation of a stranger. There are said to be two hundred of these of a day, all laden with corn for this market, and which of course, according to their usual lading, must contain fourteen or fifteen hundred quarters of grain. Most of this is bought up by the merchants and their agents, for foreign markets, so that in the last year near twenty thousand quarters were exported from Cowes only. A great deal indeed, both of their barley and wheat is manufactured amongst themselves, and sent abroad in flour, malt, and biscuit, for the navy, &c. Though in some articles this manufacture has greatly diminished of late years, since the government have caused mills and ovens to be erected for naval services.

Here is also exposed to sale in this market, a large and pleasant sample of the various other productions of this fertile spot. Their poultry and butter, in particular, are so plentiful and good, that great quantities of both are weekly bought up for the supply of Portsmouth, &c. and of the latter much is barreled for the winter consumption, and exported to very distant parts. The rural inhabitants, which resort in great numbers to the markets for business, are of a remarkably sound and healthy complexion; and the fair sex are deservedly esteemed as some of the most beautiful of their species.

Newport sends two members to parliament; and besides the two weekly markets already mentioned, has an annual fair on Whitfun Monday, for horses and toys.

About a mile to the westward of this town stands Carif-

Carisbrooke castle, which is seated upon a very exalted eminence overlooking a village of the same name. This was once a considerable fortress, and is said to have been built by Whitgar, a favourite of Cerdic, king of the West Saxons, to whom he gave the island after having subdued it, as was before noted. It was afterwards improved by Richard de Rivers, earl of Devon, in the reign of Henry I. and repaired by queen Elizabeth; but it is now fallen into great decay. Though the hill upon which the castle stands has few to exceed it for height in the island, yet it is plentifully supplied with water, than which there is none better. It is drawn up from a well of seventy-two yards deep, by the labour of an ass, which runs in a wheel for that purpose. Upon these, and some other accounts, particularly its being famous for the retention of state prisoners, this fortress is still visited by strangers, as a piece of antiquity well worth their notice.

Among the state prisoners that have been imprisoned in this castle, was the unfortunate king Charles I. who was confined here eight months by colonel Hamond, then governor of Carisbrooke-castle for the parliament; and they still shew the window through which that prince endeavoured to make his escape.

Near the Carisbrooke-castle is a village of the same name, and was a considerable town when Cadwalla took the island, and put all the inhabitants to the sword; since which time, it has never recovered itself. The church is dedicated to St. Mary, and was given by William Fitz Osborn, earl of Hereford, and nephew to William the Conqueror, to the abbey of Lyre in Normandy, upon which a prior and some black monks, from that foreign monastery, were settled here.

At Arreton, a village about three miles south-east of Newport, Baldwin de Redveris, afterwards earl of Devon, built, in the year 1132, an abbey of Cistercian monks, and dedicated it to the Virgin Mary. This monastery continued till the general suppression, when its annual revenues were valued at one hundred and thirty-four pounds, three shillings and eleven-pence.

Cowes is the name of two considerable towns situated at the mouth of the river running by Newport, and distinguished by the epithets East and West, from the situations being on different sides of the river. That on the west side, and thence called West Cowes, is by much the largest place, and has the most trade of any in the island. Here are two castles, built by Henry VIII. to defend the entrance of the river: that on the east side of the river has been long neglected; but that on the west side has a garrison, under the command of the deputy-governor of the island.

The ports of East and West Cowes were in a flourishing condition while the heavy duties on goods imported from the American colonies were continued; for then the ships from Virginia and the West Indies used to land their cargoes here, and after re-shipping them, proceed on their voyage to Holland, Hamburg, and other markets; by which means they were entitled to a draw-back of the greater part of those heavy imposts. Here also the masters of merchant-ships are furnished with money for bills; and here the outward-bound ships are supplied with fresh provisions and stores. Several reputable merchants reside here, where many elegant houses have been built within these sixty years past; but the situation is low, and on that account not reckoned so healthy as the higher parts of the island. The church at West Cowes is only a chapel of ease to Northwood, a small place about a mile to the southward of Cowes.

At Burton, near East Cowes, there was, as early as the reign of Edward I. a priory of black canons of the order of St. Austin, dedicated to the Holy Trinity. It consisted of several chaplains, under the government of an archpresbyter, who, in the nineteenth year of the reign of Henry VI. gave away the estate of the priory to St. Mary's college in Winchester.

Newton, or Newtown, is a small borough, situated at the head of a little creek, about five miles south-east of West Cowes. It has sent members to parliament ever since the reign of queen Elizabeth, and is governed by a

mayor and burgeses; but is a very inconsiderable place, though it has a convenient harbour.

At Marvel, in the neighbourhood of Newtown, a college for four priests was founded by Henry de Blois, bishop of Winchester, and augmented by Peter Roch, and Henry Woodlock, two of his successors in that see; and in the park near this place, is still a church, in which was a chauntry at the dissolution of religious houses.

Yarmouth is another borough-town, and considerably larger than Newtown. It is situated near the mouth of a creek on the west side of the island, four miles from Newtown. It was incorporated by king James I. and is governed by a mayor, recorder, aldermen, bailiffs, and common-councilmen. It is defended by a castle, which, with the castles of Sharpnose and Hurst, forms a triangle. The works are kept in repair, and there is always a garrison here. The houses are handsome, and most of them built of free-stone. It is often called South Yarmouth, to distinguish it from Great Yarmouth in Norfolk. This town sent members to parliament in the twenty-third year of Edward I. but not afterwards, till the reign of queen Elizabeth, when the privilege was renewed, and has continued ever since. The members are chosen by the corporation and burgeses, who are about fifty in number, and returned by the mayor. Here is a market on Friday, and a yearly fair, on the twenty-fifth of July, for toys.

About two miles to the westward of Yarmouth, is Sharpnose-castle. It stands directly opposite to Hurst-castle in Hampshire, and about two miles to the eastward of the Needle-cliffs. This castle has also a garrison under a governor.

At Appledurcomb, near the south coast of the island, there was a cell of Benedictine monks, subordinate to the abbey of St. Mary's de Montisburgh, in Normandy. It was founded about the end of the reign of Henry III. by Isabella de Fortibus, and was dissolved, with the rest of the alien priories, by Henry V. And at Godshill, a little to the north of Appledurcomb, there is a church, which was early appropriated to the abbey of Lyre in Normandy.

About five miles to the eastward of Appledurcomb, is Sandown-castle, one of the strongest fortifications in the whole island, and has always a garrison, with a governor, captain, and thirty wardens, besides gunners. It stands at the north extremity of Sandown-bay, the only place where it is possible to land in this part of the island.

St. Helen's is a small place, about three miles to the northward of Sandown-castle, and remarkable for a spacious road before it, where large fleets often come to an anchor. The village of St. Helens stands on the north side of an arm of the sea, which here runs up a considerable way into the land. Here was formerly an alien priory of Cluniac monks, but dissolved, with the rest of foreign monasteries, by Henry V.

Having made a tour of the Isle of Wight, and viewed every thing curious in that delightful spot, we again embarked at Cowes, and after a few hours, landed at Portsmouth.

Continuing our journey to the eastward, we passed through Havant, a neat market-town, nine miles from Portsmouth. The road leading from Portsmouth to Chichester, and which runs through Havant, is lately made a turnpike-road: we wish we could say it was any thing better for the alteration; but all the improvements we observed, were the gates erected for receiving the tolls.

Havant has a weekly market on Saturday, and two annual fairs, viz. the twenty-second of June, and the eleventh of October, both for toys.

About a mile from Havant, on the south side of the road, are the remains of a famous castle, formerly belonging to the earls of Surry. One of the towers is still standing, together with some part of the walls, now overgrown with ivy. Part of the moat also which encompassed this castle, is still visible. A farm-house is built out of the ruins, and on the site of the ancient mansion; and near it is the parish-church, a very low and mean edifice, but frequented by a large congregation.

Two miles from Havant, and on the road to Chichester, is Emsworth, a very flourishing sea-port town, situated at the head of one of the branches of Chichester-haven. Here are three ship-wrights yards, where a great number of coasting vessels, from an hundred and fifty to twenty tons burden, are continually building. This town has increased prodigiously within these twenty or thirty years past, and there are now near eighty sail of coasting vessels belonging to it. Here are also two large water-mills for grinding corn, great quantities of flour being sent from hence to London, Bristol, Ireland, and other markets in these kingdoms. It has no market, but two annual fairs, the first held on Easter Monday, and the second on the eighteenth of July, both for toys.

Remarks on the SEA-COASTS of Hampshire.

The sea-coasts, which terminate the main land of Hampshire to the south, have nothing remarkable, except a bank of sand stretching all along the shore from Hurst-castle to Calshot-castle, at the mouth of Southampton-water. This bank is about a mile in breadth, and the greater part of it is dry at low water.

Two miles to the southward of Calshot-castle, and near the middle of the channel between the main land and the Isle of Wight, is a shoal called the Bramble, on which there is not above three feet at low water; care must therefore be taken to avoid this bank in passing up or down the channel.

A mile S. S. E. from the Bramble, is another sand-bank, called the Middle, on the shoalest part of which there is not more than three feet at low water; and must therefore, like the former, be carefully avoided.

About two miles to the westward of Portsmouth harbour, is a village called Stoke, before which is a fine road, called Stokes-bay, where ships often ride. The water is from three to seven fathoms deep, and the bottom very good anchor-ground, being an oozy sand.

A little to the northward of Gilkicker, a sea-mark erected on the western point of Portsmouth harbour, a sand-bank, called the Spit, stretches off a mile from the shore, which obliges all ships going into Portsmouth harbour to pass near South Sea castle, the channel lying within half a mile of it.

From South Sea castle, a large sand stretches all along the shore for near two miles to the eastward, and to the distance of two miles and a half from the shore. It is called the Horse; and on the southern extremity of it a large buoy is placed, that ships may avoid it as they pass along the channel leading to Spithead. The depth of the water on this sand is from three to ten feet at low water. Several ships have been lost on this sand; the eastern point of which, called the Dean, forms the western bank of the channel leading to Langstone-haven. The east side of the above channel is formed by another sand-bank, called the Walsener, part of which is dry at low water.

From hence to the mouth of Chichester harbour, which terminates Hampshire to the eastward, is one of the finest beaches, composed of pebbles, sand and shells, any where to be seen; and at the foot of it a sand-bank, stretching off about half a mile into the sea. Part of this sand-bank is dry at low water.

We now come to describe the sea-coasts round the Isle of Wight; and shall begin at a shoal called Norman's-land, which lies at the north-east corner of the island. This bank, which is dry at low water, forms the southern shore of the channel leading to Spithead. At the north-east point of this bank is a buoy, near opposite to that placed on the Horse; the channel, which is here but little more than a mile in breadth, running between them. This bank extends above five miles in length, to a place called Fish-house, where it is terminated by a creek running up a considerable distance into the island.

A small ledge of rocks lies along the shore near the eastern point of Cowes harbour; but they are dry at low water, and so very near the land, that no danger can be apprehended.

From the point opposite to Hurst-castle, to the Needle cliffs, the shore is full of rocks, and therefore dangerous to ships when they come too near the land.

The channel to the westward of Hurst-castle is bounded on the south by the Needle-cliffs, and to the northward by a bank of pebble-stones, called the Shingles. This channel is something less than a mile in breadth; and the bank is dry at low water.

All the southern coast of the island from the Needle-cliffs to Sandown-bay, is bounded by prodigious rocky precipices; but in northerly winds, Freshwater-bay is an excellent road, though the utmost care is necessary to avoid it when the winds are southerly.

Mention has been already made of landing upon almost any of the southern coasts on the Isle of Wight, which is indeed very often fatal to sailors; particularly in one part of it, called Chale Bay, where there is such an eddy, as renders it extremely difficult, when a lee-shore, to keep an offing sufficient to avoid the danger. At the same time, it gives us pain to remark, that the country-people, of the meaner sort, have for many years been too justly accused of making a barbarous advantage of these misfortunes, plundering and carrying off the effects of the unfortunate sufferers in a most unjust and infamous manner. But this savage practice has been lately very much suppressed; and it is hoped, for the honour of humanity, will be soon totally abolished.

To the eastward of Chale Bay is a very lofty head-land, called Dunose, which is visible at a great distance. The whole shore is bordered with rocks, without a single road for ships, before we come to Sandown-bay, where there is good riding for ships in westerly winds; the water being from two to seven fathoms deep, and the bottom an oozy sand.

A little to the north-east of Sandown-bay, is a very remarkable head-land, called White-cliff, Swan-cliff, and Beacon-cliff. The two former are owing to its appearance, being a hill of chalk, rising nearly in a perpendicular direction from the sea, to an amazing height; and the latter to a beacon, formerly erected on its summit.

About three miles to the northward of White-cliff, is Bembridge Point, before which is a prodigious ledge of rocks, called the Mixon. This ledge extends near a mile from the shore, which must therefore be here carefully avoided.

Bembridge Point forms the southern extremity of St. Helens road, the northern being the Horse, and Norman's-land, already described.

Curious PLANTS found in Hampshire.

Bird's-foot, *Ornithopus*, found plentifully in the heaths near Petersfield.

Monks Rhubarb; *Rumex*, found in the fields near Rumsey.

Common broad-leaved Liverwort, *Lichen petraeus latifolius*, five hepatica fontana, C. B. found in several parts of the New Forest, between Rumsey and Christchurch.

Sea Scurvy-grass, *Cochlearia*, found plentifully on the sea-shore near Emsworth.

Buglafs, *Anchusa*, found on the sides of the hills near Petersfield.

Sweet Cane, *Calamus aromaticus*, found in many of the brooks near Winchester.

Sun-dew, *Ros Solis*, found in the meadows lying along the banks of the Itching.

Round-leaved Marsh St. Peter's-wort, *Ascyrum supinum palustre villosum*, Ray, found near the borders of springs, chiefly near Aylsford.

Butter-wort, with a small flesh-coloured flower, *Pinguicula flore minore carnea*, Ray, found in a boggy ground near Lindhurst, in the New Forest.

Sampire, *Critimum*, seu *Feniculum marinum*, Ray, found among the rocks, particularly on the sides of White-cliff, in the Isle of Wight.

Water-mint with a spicy smell, *Mentha arvensis verticillata folio rotundiore odore aromatico*, Ray, found under the hedges near Whitechurch.

Marsh Asparagus, or Sperage, *Asparagus palustris*, Ger. found on several of the cliffs in the Isle of Wight.

Small Sea-crane's Bill, *Geranium pusillum maritimum supinum botanicæ folio*, Ray, found on the shores near Emsworth.

Tender ivy-leaved Bell-flower, *Campanula palustre cymbulariæ foliis*, Ger. found on the sides of the river Teste, near Rumsley.

Verticulate Knot-grass, with thyme-like leaves, *Polygonum serpyllifolium verticulatum*, Ray, found in the watery meadows near Bedhampton.

Hairy Kidney-wort, *Cotyledon hirsuta*, Ray, found near Silchester.

Wood-sage, *Salvia agrestis, seu scorodania*, Ger. found in several parts of the New Forest.

The English Sea-pease, *Pisum maritimum angelicum*, Ray, found on the beach near Hurst-castle.

Smooth-leaved Rupture-wort, *Herniaria glabra*, Ray, found in plenty on the beach near Freshwater, in the Isle of Wight.

Eryngo, or Sea-holly, *Eryngium marinum*, Ray, found on the beach near Sandown-castle, in the Isle of Wight.

Wood-sorrel, *Acetosellum*, found in the woods near Havant.

Antique COINS found in Hampshire.

A very great variety of coins have been found in this county, especially of the Romans. A very considerable

quantity were dug up at Winchester about the year 1621. In several parts about Southampton, Roman coins have also been found, especially about the ruins of the Roman city called Caufentum, in the neighbourhood of that town. At Porchester, near Portsmouth, also Roman coins have been found; a sufficient indication that the Romans once possessed that castle, the works of which are still entire. At Silchester, vast quantities of Roman coins have been, and are still daily found. Coins have also been found near all the Roman camps we have mentioned in their proper places. But the Roman are not the only antique coins that have been found in this county; several struck by the Britons, Saxons, and Danes, have also been found here, especially at Silchester, Winchester, Southampton, Redbridge, Rumsley, Wherwell, at Newport in the Isle of Wight, and several other parts of Hampshire.

MEMBERS of PARLIAMENT for Hampshire.

This county sends twenty-six members to parliament, two knights of the shire for the county, two citizens for Winchester, and two burgeses for each of the following corporations; Southampton, Portsmouth, Newport, Yarmouth, Newton, Lymington, Christ-church, Andover, Whitchurch, Petersfield, and Stockbridge.

S U S S E X.

THE county of Sussex, or, as the original name from which the present is formed by corruption, which implied, the country of the South Saxons, is bounded on the west by Hampshire; on the north by Surry; on the east by Kent; and on the south by the British Channel. It is about sixty-nine miles in length, twenty-nine in breadth, and one hundred and seventy in circumference, and contains one thousand four hundred and sixteen square miles. It is divided into six rapes, which has each its particular castle, river, and forest; and is subdivided into sixty-five hundreds, containing three hundred and twelve parishes, one hundred and twenty-three vicarages, one city, eighteen market towns, one thousand and sixty villages, hamlets and chapelries, about twenty-one thousand five hundred and thirty-seven houses, and twelve thousand nine hundred souls. Cuckfield, a market town near the middle of the county is forty miles S. W. of London.

R I V E R S.

The principal rivers in this county are the Arun, the Adur, the Ouse, and the Rother.

The Arun rises in St. Leonard's forest near Horsham, a borough town of this county, and running a few miles westward, turns due south, and passing near Arundel, another borough town, falls into the English channel, at a place called Little Hampton, about three miles to the south of Arundel.

The Adur, sometimes called the Beeding, rises also in St. Leonard's forest, and running almost parallel to the Arun, passes first by Stening, and afterwards by Bramber, two boroughs, and from the latter has obtained the name of Bramber waters. After leaving the above towns, it continues its course in a southern direction to New Shoreham, another borough town; where it turns to the east, and falls into the British channel about three miles below Shoreham.

The Ouse is formed chiefly of two branches, one rising in the forest of St. Leonard, near the source of the Adur, and the other in the forest of Worth, north of Cuckfield. These two streams unite near Brighthelm, and continue their course in a south-east direction to Newyck, where the river bends to the south, and in that direction, after being encreased by several rivulets, passes by Lewis, a very considerable borough town, and falling into the British channel, forms a harbour called New-haven, about eight miles below Lewis.

The Rother rises at Rotherfield, near the forest of Downe; and running eastward divides itself into two streams, upon the borders of Kent, and uniting again forms an island called Oxney Island, and falls into the British channel near Rye, one of the Cinque ports.

Besides the above there are several less considerable rivers in this county, particularly the Lavant, the Cuckmeer, the Ashburn, and the Auster, all which, as well as the rivers whose courses have been described, are confined within the limits of Sussex; but are too small to merit a particular description.

Remarks on the INLAND NAVIGATION of Sussex.

The harbour of Chichester is sufficiently capacious to contain the whole navy of England; but a bar stretches across the mouth of it in such a manner as to render the entrance very dangerous; nor is there water enough for a large ship, but at high-water on a spring tide: nor is this all, the bar is not fixed, but shifts with every storm, and often with every tide, so that only persons who reside upon the spot are capable of carrying in and out of this harbour. It is however pretty much frequented by vessels

trading to and from Chichester, Emsworth, Bosham, and other places situated near it.

About ten miles to the eastward of Chichester, is Siddleham haven, which vessels enter with the tide, there being so little water when the tide is out, that the mouth of the harbour may be forded.

Nine miles farther to the eastward is the village of Little Hampton, built at the mouth of the Arun. Here was formerly a very good harbour, called Arundel Port or the harbour of Little Hampton, capable of receiving ships and vessels of considerable burden; but a beach being thrown up by the sea, it was quite choaked up, and the navigation so greatly obstructed, that the harbour was rendered in a manner useless. To remove this obstruction, an act passed in the year 1733, for erecting piers, cutting a canal through the beach, erecting locks, and other works necessary to cleanse the harbour and keep it from being choaked up by the sea. This act has accordingly been carried into execution; and the harbour is now capable of receiving ships of considerable burden. Barges go up to Pulborough, a small town twelve miles from the works at the mouth of the river, and vessels of a hundred tons as high as the key at Arundel.

One great advantage to the county from this river is, the shipping off great quantities of large timber, which is carried to the royal docks at Portsmouth, Chatham, Woolwich and Deptford, and some of it even to Plymouth. The timber shipped off here is esteemed the best and largest brought from any part of England: great quantities of knee-timber is also exported from hence; a commodity of the utmost consequence in ship-building.

About fourteen miles to the eastward of Little Hampton, is the harbour of Shoreham, formed by the mouth of the Adur. The harbour will not admit ships of large burthen; nor has the navigation received any improvements from art. Indeed there are no places of consequence in the neighbourhood, so that the meer current of the river answers all the purposes of an inland navigation, we mean that of bringing down timber felled in the adjacent woods; which is now conveyed by floats to New Shoreham, where there is water sufficient for ships of one hundred tons burden.

New-haven lies about twelve miles to the eastward of New Shoreham; and was once a very safe and commodious harbour for ships of considerable burden; but for want of keeping in repair the timber piers, which it had from time immemorial, it was quite neglected, the piers became rotten, and the harbour choaked up with sand and beach. To remedy these evils, an act passed in the year 1731, for repairing and keeping in repair the said piers, and harbour. It has not, however, yet been carried into execution, though it could not fail of being of the greatest advantage to Lewis, to which place the river might be made navigable at a very small expence, and the neighbouring parts.

Pevensey, which is about fifteen miles farther to the eastward, had also once a good harbour, but is now totally choaked up with the sands; nor is there any other port in this part of the county till you come to Hastings, where ships may ride safely in northerly and westerly winds.

Rye, which is eighteen miles to the north-east of Hastings, had formerly a very fine haven; but it is now through neglect, almost choaked up. Some considerable families who have lands near the channel, have taken advantage of this neglect, to extend their boundaries still nearer to the channel, by which means, there is not back water sufficient on the ebb to scour away the beach thrown up by the flood. Nor was this the whole mischief occasioned by these encroachments; for now ships of small burden only can come within any convenient distance of

the town; whereas formerly the largest vessels, and even whole fleets together, could anchor just by the rocks on which the town stands: and as this port lies over-against Dieppe in France, and there is no other harbour between Portsmouth and Dover that can receive large ships, this harbour, in its original state, would prove of the greatest advantage to the trade and navigation of the kingdom. Nor were its uses unknown to the legislature; for an act of parliament passed in the year 1721, which enacts, that no new walls, banks, dams, or stops, shall, for the future, be erected on either side of the water, having any tendency to alter the flux or reflux of the sea, between the mouth of the harbour, and the New Shutt, near Craven-sluice.

In the year 1723, another act passed for completing the repairs of the harbour of Dover, and for restoring the harbour of Rye to its ancient goodness, which still continued to be choked up, and almost ruined, by the shifting of the beach without, settling of the foilage within, and stopping the flux of the tide, which this act proposed should have its free course through the Scotch flat and Craven sluices, or into such other channel as should be found most proper and expedient.

And in 1724, another act passed for making the last act more effectual, so far as it related to the harbour of Rye, in which a power was given to change the design of making a passage by the above sluices, and to open a new cut from the Winchelsea channel, strait out to the sea. And they actually began, in pursuance of this act, to cut a broad and deep channel, which was to be carried to the sea, on the side of Winchelsea, for the use of the two boroughs. But these provisions being still found insufficient, another act passed in 1738, for continuing the term and powers granted by the former acts, for repairing the harbour of Dover, and for restoring that of Rye to its ancient goodness.

In 1751, another act was passed for making a commodious harbour here; and on the fourteenth of July, 1762, the new harbour was opened, where ships of three hundred tons burden may ride with the greatest safety.

AIR, SOIL, and PRODUCTIONS.

The air along the sea coast is reckoned agreeable, at least to foreigners; but the inhabitants are very healthy. In the northern parts of the county, bordering upon Kent and Surry, a large woody tract called the Weald, or Wild, which is said to be about one hundred and twenty miles long, and in some parts near thirty broad, the air is foggy but not unhealthy; and upon the downs, in the middle of the county, it is exceeding sweet and pure.

In the Weald of Sussex the soil is rich and deep, and produces great quantities of oats and hops; but the roads, in the winter season, are the worst in England; for many of the prodigious trees which grow here, and are carried through this part of the country in the summer-time, to the Medway, on a carriage called a Tug, drawn by twenty oxen, advances so slowly, that it is often several years before the tree reaches the place of its destination; for if once the rains set in, it stirs no more for that year, and often the summer is not dry enough to make the roads passable. These northern parts are, in general, covered with woods, from whence the royal docks are chiefly supplied with timber, the iron-works with fuel, and many parts of the kingdom with charcoal.

The middle part of the county is delightfully chequered with meadows, pastures, groves, and corn-fields, which produce great quantities of wheat and barley. In the southern parts towards the sea, are high hills, called the South Downs, consisting of a fat chalky soil, very fruitful both in corn and grass; and feeding vast multitudes of sheep, remarkable for their fine wool, which is too often exported clandestinely to France, by farmers and jobbers, here called Owlars.

In the Weald of Sussex is found a mineral called Talc; and in the eastern part of the county great plenty of iron-ore is dug; and here are many furnaces, forges, and water-mills, both for cast and wrought iron.

Sussex is particularly famous for a delicious bird, called the Wheat-ear, perhaps from its being most in season when that species of corn is ripe: it is about the size of a lark, and so fat and tender, that they cannot be carried far, or kept long in their feathers; for which reason they are generally potted, and sent to London and other places. These delicate birds are taken in the following manner: They cut up a turf about a foot long and six inches broad, and turn up the turf to cover the hole, in which they fix a snare made with horse-hair; and as the bird is remarkably shy and timorous, it will, even at the appearance of a dark cloud, run for shelter into those traps, where they are taken. Great numbers of these traps may be seen at the proper season, on the sides of the hills between Lewis and Eastbourne; and sometimes the quantity taken is so large, that one shepherd has been often known to get thirty or forty dozen in a day. They are found here only about the time of harvest; coming a little before that season, and leaving the country soon after; but to what part of the world they retire and spend the other parts of the year, is not known. In the river Arun are caught vast quantities of mullets, which, in the summer season, come up from the sea as far as Arundel, in vast shoals, where, by feeding on a particular weed in the river, they acquire so fine a taste, as renders them a great delicacy. Among the rocks on the coast between Chichester harbour and the mouth of the Arun, the finest lobsters in England are taken; and the cockles found in the sands near Selsey, are greatly admired. The mackerel and herrings also caught near Rye are esteemed the best of their kind.

HUSBANDRY of Sussex.

The Sussex husbandmen, though very assiduous in their business, have not adapted the modern improvements in that necessary art. They follow the tract of their forefathers with very little variation. The turnep husbandry is hardly known, and their pease and beans are never hoed, by these means great part of the farmer's profits are lost. They use wheel plows, and turn up an acre of land in a day with four horses. Their course of crops in general, are, 1. fallow, pease or beans, 2. wheat, 3. barley. The new, or drill husbandry is very little known, being practised only in some few parts of the county. They are strangers to the method of feeding hogs with clover, though perhaps a field of that grass cannot be turned to so much profit any other way. The rent of land is from ten to twenty shillings per acre. They plow three times for wheat, sow three bushels on an acre, and often reap four quarters, three is reckoned a middling crop. For barley, they plow twice, sow two bushels, and reckon three quarters a middling produce. They plough but once for pease, sow three bushels, and reap at a medium two quarters and a half. They rarely sow vetches, except for cutting green as fodder for their cattle; they plough but once for them, and sow two bushels on an acre.

The farms are not large, especially in the western parts of the county, generally from thirty to two hundred pounds a year.

In the pastures about Chichester, Amberley, and other districts of the county, great numbers of oxen are fatted, and sold to the victualling-office at Portsmouth, and to the butchers in the neighbouring towns. The price of labour, as far as we could get information, is as follows:

A labourer 1 s. 4 d. a day all the year round except harvest.
 In harvest 2 s. 6 d. with beer.
 Reaping wheat 4 s. 0 d. per acre.
 Mowing barley 1 s.
 ——— grass 1 s. 6 d.
 Raking barley 0 8 d
 A lad of thirteen or fourteen years old has four-pence a day.

In the southern parts of the county, they make great use of sea-ore for manuring their land; and some of the farmers

farmers adopt the rational practice of making a compost dunghill with that weed, dung, earth, and the soil taken out of ditches, and the bottoms of ponds and rivers. Lime and soap-ashes are also used as manures, but not so generally as they deserve; but the coal-ashes are suffered to lie in heaps, without the farmers thinking it worth their time and labour to fetch and spread them on their ground; nor could we find they ever made use of sea-sand as a manure, though in many parts it is sufficiently mixed with broken shells and coral. In the northern parts, they constantly fold their sheep, and are very attentive to collect every species of manure that offers.

TRADE and MANUFACTURES.

The principal trade of this county consists in exporting corn, flour, timber, and other products of the county; for it has very little foreign trade, except to France, when the exportation of corn is allowed. And with regard to the manufactures, the principal are cast and wrought iron, charcoal, and gunpowder; the latter, which is made at a market-town called Battel, is said to be the best in the world.

CITY, BOROUGHS, MARKET TOWNS, &c.

We entered this county near Emsworth, over a stone-bridge of two arches, and immediately turned to the northward, in order to view a fine seat called Stanstead, lately belonging to the earls of Scarborough, and the Lumley family, but now to the earl of Halifax. In our way, we passed through a small town called Westbourne, where there was formerly a market, which has been for many years disused, though the market-house is still standing. The church is capacious, with a handsome square tower, but has nothing in it remarkable.

Stanstead is about three miles to the north of the road leading from Portsmouth to Chichester. It stands in the middle of a very fine park, finely diversified with walks and lawns, and the vista from the house towards the west, is one of the finest we remember to have seen in all our travels. The house is extremely elegant, and has four fronts, facing the four cardinal points. The grand stair-case is extremely beautiful; and in several of the rooms are very fine tapestry, representing several actions of the army commanded by the famous duke of Marlborough, under whom one of the Lumley family served. The prospect from this seat is beautiful beyond description, especially from the roof, which is flat, and covered with lead. To the south and south-west, you see the several harbours and arms of the sea from Southampton-water to Chichester-haven, the ships at Portsmouth and Spithead, together with those passing and re-passing between the several ports, and finely terminated by the Isle of Wight. The interjacent country is beautifully diversified with woods and water, corn-fields and meadows, and interspersed with towns, villages, and farms. To the eastward is a charming country, decorated with gentlemen's seats, and rural habitations. Chichester spire is distinctly seen, and adds greatly to the beauty of the perspective.

When we were at Stanstead, the earl of Halifax was making several improvements, which, when finished, will be great ornaments to this beautiful seat: but we could not help observing with regret, that this charming retirement was destitute of water, and consequently, wanted one capital beauty. The house indeed is supplied with good water from a deep well sunk in what is called the Old Buildings; but there is none for fountains, and other decorations of that kind. We were informed, that several years since, the house, gardens, and fountains, of which there were then several, were supplied with water from the river at Westbourne, by means of an engine, and were shewn the place where the engine was erected. The water-wheel was placed under an arch, which supported a small house, the residence of the person who had the care of the engine. This building, which is yet standing, is still called the engine-house. But from some cause, now unknown, the works were suffered to decay, the

reservoir, into which the water was thrown, filled up, the fountains in the gardens removed, and the well already mentioned sunk, to supply the necessary want of water in the family.

The Old Buildings above-mentioned are the remains of a very ancient and capacious house, once the seat of the Lumley family, the present edifice not having been erected above seventy or eighty years. The original structure appears, from the few parts of it still remaining, to have been a noble pile of building in the Gothic taste. It was decorated with towers, several of which are yet standing, and other ornaments, which still exhibit a magnificent appearance, even in decay.

Leaving Stanstead, we pursued our journey towards Chichester, through a very beautiful country, lying at the foot of the South Downs. On the summit of one of these eminencies, called Bow-hill, are four large barrows, said to be the sepulchres of four Saxon kings or generals, slain in a battle fought at the foot of this hill.

The city of Chichester is situated in a plain, on the river Lavant, sixty-three miles from London. It was called Caercci by the ancient Britons, and their king Careticus was besieged in it by some Saxon and Norwegian pirates, who set the city on fire, and Careticus retired to the mountains of Wales. After the establishment of the Saxon heptarchy, it was rebuilt by Cissa, the second king of the South Saxons, who called it Ciffanceaster, or the city of Cissa; and the South Saxon kings made it their royal residence.

When William the Conqueror landed in England, there were only an hundred houses in Chichester; but that prince bestowing it on Roger de Montgomery, he made so many additions to the buildings, that bishop Strigand removed his episcopal chair hither from Selsey, where it was originally placed; and his successor, Ralph, began a cathedral here; but the structure being consumed by an accidental fire, on the fifth of May 1114, before it was finished, he laid the foundations of a second, which was completed by his successors. This second cathedral, together with the greater part of the city, was also burnt in the reign of Richard I. but Selfrid, or Saffrid, then bishop of Chichester, rebuilt both the cathedral and the town.

Chichester is a county of itself, and governed, according to a charter of king James II. by a mayor, a recorder, aldermen, and common-council, without limitation. The mayor is chosen annually, and is attended by four serjeants at mace, and a common crier.

It is a very neat and compact city, inclosed by a stone wall, in which are four gates, facing the four cardinal points. A street runs from each of these gates, distinguished by the epithets East, West, &c. according to the point its gate faces. These streets, which are broad, and the houses tolerably well built, cross each other in the centre, where there is a cross erected by Edward Story, bishop of this see, about the beginning of the sixteenth century, and repaired and beautified in the year 1746 by his Grace the late duke of Richmond; so that it is at present one of the most beautiful crosses in England. From this cross the four gates of the city might once be seen, but at present only those at the east and south; the view towards the west being obstructed by a row of mean low houses built along the wall of the cathedral church-yard, which was formerly the south boundary of the street; and that towards the north by a range of buildings, extending some distance from the cross towards the north gate, along the west side of the street. By these encroachments the regular form of the city is greatly injured; nor do the buildings themselves, abstracted from their situation, add any thing to its beauty. The market for butter, eggs, fowls, &c. is held in the cross, that for fish in the South-street, the corn-market in the North-street, and the beast-market in the East-street. The market-house is situated on the east side, and near the middle of the North-street. It stands upon pillars, and over it is the council-chamber, a very elegant room, where public balls, assemblies, &c. are often held.

The guild-hall is a very mean structure, situated in an obscure part of the town; near which is St. Mary's-

hall, an ancient hospital, erected for a master and several poor brethren, in the reign of Henry III. by William, dean of the cathedral. It was dedicated to the Virgin Mary, and, at the dissolution, valued at thirty-five pounds, six shillings and three-pence *per annum*. It is now inhabited by several poor persons, who have a small allowance weekly.

The cathedral is a very elegant, though not a large Gothic edifice, built in the form of a cross, the south part of which is, on one side, adorned with the pictures of all the kings and queens of England, from Cissa to the present time; and on the other, with all the bishops of this see. These ornaments were begun by bishop Shelburn in the reign of Henry VII. who brought them down to his time, from whence they have been continued. Shelburn added other ornaments to this church, but many of them were defaced, as well as the pictures above-mentioned, in the civil wars. The choir has been lately repaired and beautified, and is now one of the neatest in England. The spire, which is three hundred feet high, is a most excellent piece of workmanship, and cannot fail of pleasing the eye of every curious spectator. About twenty years ago, the steeple received such a shock, that it is amazing it did not tumble down; the consequence of which, in all probability, would have been the demolishing the whole church.

It was occasioned by what the inhabitants call a fire-ball, or rather lightning, which struck the steeple with such irresistible force, that it drove several large stones out of it, and carried them to a prodigious distance from the steeple. One of these stones, weighing at least a ton, was thrown over the south row of houses in the West-street, and fell on the ground at a gentleman's door on the other side of the way; and another of them, almost as large as the former, was projected over both sides of the West-street, and fell in the same gentleman's garden, without any hurt being done by either. The breach made in the spire by this shock was incredibly large, and within forty-five feet of the top, though the steeple stood firm, and was soon after substantially repaired; a sufficient proof that it was originally a sound and well-finished piece of workmanship.

In the body of the church are several monuments; but those of bishop Carleton and bishop King, whose effigies are curiously done in marble, are the most remarkable.

The chapter consists of a dean and thirty prebendaries, two archdeacons, a treasurer, chancellor, chaunter, and twelve vicars choral. The cathedral, bishop's palace, dean's house, and those of the prebends, fill the south-west quarter of the town. The palace, which is rather large than elegant, was rebuilt some time since; and in October 1727, the workmen found several ancient coins, and a curious piece of Roman pavement in the gardens.

This city has very little foreign trade: indeed, its situation is such, that it will not admit of it, being two miles from Dell-quay, the nearest port where ships can load and unload their cargoes. The citizens were so sensible of this, that an act of parliament was procured in the reign of James I. for making the river Lavant (which runs by the south walls of the town, and falls into a branch of the harbour near Dell-quay) navigable; and part of the canal was actually cut, but, for some reason, now unknown, laid aside, and has not since been resumed. There is, however, still a custom-house, with a collector, comptroller, and other officers, at Chichester.

In the year 1725, in digging a foundation for a house in the North-street, there was discovered, pretty deep in the ground, a large stone, six feet long, and three broad, with the following Roman inscription, which was something defaced by digging up the stone, cut upon it:

Neptuno et Minervæ Templum, pro salute domus divinæ, ex auctoritate Tiberii Claudii, Cogidubni regis, legati Augusti in Britannia, collegium fabricorum, et qui in eo a sacris, vel honorati sunt, de suo dedicaverunt; donante arcem Pudente Pudentini filio.

This temple was dedicated to Neptune and Minerva, for the safety of the Imperial family, by the authority of Tiberius Claudius. It was erected by the college of artificers of king Cogidubnus, the lieutenant of Augustus in Britain, and by those who officiated as priests, or were honoured in it at their own expence; the ground being given by Pudens, the son of Pudentinus.

This stone was presented to the late duke of Richmond, who placed it in a temple erected on a mount in his garden at Goodwood, between the statues of Neptune and Minerva.

A considerable quantity of malt is made here, and much larger quantities of corn ground for exportation in the neighbourhood; but the chief manufacture is needles. Here is a free-school for forty-two boys, and a charity-school for twenty girls.

Chichester sends two citizens to parliament, has two weekly markets on Wednesday and Saturday, besides a very large beast-market every Wednesday fortnight, and five annual fairs, viz. the third of May, Whitsun Monday, and the fifth of August, for horses and black cattle; the tenth of October, for black cattle, toys, and hiring servants; and the twentieth of October, for horses, sheep, and black cattle.

Near the North-gate, within the walls of the city, was a house of Grey-friars, founded in the time of Henry III. It is now a very genteel seat, and belonged, when we visited Chichester, to Hutchens Williams, Esq; Near the East-gate was a monastery of Black-friars, said to have been founded by queen Eleanor, wife of Edward I. and dedicated to St. Mary and St. Vincent. It is now a gentleman's house.

Here was also an hospital for lepers, founded in the reign of Richard I. It was dedicated to St. James and St. Mary Magdalen; and valued, upon the dissolution, at four pounds, fourteen shillings and ten-pence *per annum*.

On the north side of the city is a large Roman camp, called the Brill. It is an oblong square, above half a mile in length, and a quarter of a mile in breadth. Its area is a flat plain, situated on an eminence that commands the town, with a large rampart and single gruff, and is generally thought to have been the first camp occupied by the emperor Vespasian, after his arrival in Britain. On the same side of the city is another camp, called Gonshill, which is also supposed to have been thrown up by the Romans, it being an oblong square.

On the summit of Rook's-hill, a lofty down about four miles to the north of Chichester, is an ancient camp of a circular form, something more than a quarter of a mile in diameter, supposed to have been thrown up by the Danes.

About three miles to the north-east of Chichester, is Goodwood, a seat belonging to his grace the duke of Richmond. It was the ancient seat of the earls of Northumberland, and in a very ruinous condition, till repaired by the late duke, who also built some very proper offices, which are to correspond with a mansion-house designed by Colin Campbell, and published in his *Vitruvius Britannicus*.

The present edifice has an easy descent towards the east, south, and south east, with the prospect of a rich and beautiful landscape, bounded by the sea for thirty miles in length. The Isle of Wight terminates the south-west prospect, and the famous Rook's-hill covers it from the winds of the north. The late duke erected a room on a rising ground at the upper side of the park, from whence there is a view of the country for many miles, and a noble prospect of the sea, together with the harbours of Portsmouth and Spithead. In this room his grace frequently entertained his company at dinner, there being a good kitchen built near it, with many other conveniencies; a very pretty garden, stored with a great variety of curious plants and flowers surrounding each side of the room.

About a mile to the east of Goodwood is a seat called Halmaker, belonging to the late countess dowager of Derby, and was formerly in possession of the Delaware family. The ancient part of the house is the remains of a castle; but the other part, which is modern, has a noble

noble appearance. From the windows in the front is a fine prospect of the sea. The park is small, but very beautiful, having been greatly improved by the late earl, who had here a very complete chemical laboratory.

Near this seat is the village of Boxgrove, where Robert de Haya, in the time of Henry I. founded an alien priory, subordinate to the abbey of L'Essay, in Normandy. It was dedicated to the Virgin Mary, and occupied by the order of St. Benedict. Its yearly revenues, at the dissolution of religious houses, amounted to one hundred and eighty-five pounds, nine shillings and eight-pence. The ruins of this monastery are still visible, and the church is now the parish-church. Here is a free-school, founded by the late countess of Derby.

About four miles to the north-east of Halmaker, is a village called Charleton, remarkable for being the seat of fox-hunters. Here are many small hunting-seats, built by persons of quality, who reside there during the season for fox-hunting; but the most beautiful of these houses is that erected by his grace the late duke of Richmond. Here is also a large room, called Fox-hall, designed by the earl of Burlington, where the gentlemen fox-hunters dine together every day during their stay at Charleton.

In the neighbourhood of this village is a forest, which was formerly in the possession of the Lumley family; but was some years since purchased by the late duke of Richmond, who greatly improved the beauty of it, by making new plantations, and cutting fine walks through several parts of it. These walks all meet in the centre of the forest, where there is an open plain, on which the duke used to cause tents to be pitched for the entertainment of his friends.

Having viewed, with great satisfaction, these parts, we returned to Chichester, and visited Boseham, a small fishing-town about four miles from that city, in order to view the church, the only object worth attention. It was built in the reign of Henry I. by William Wareloft, bishop of Exeter, who placed in it some prebendaries. Afterwards, this church became a royal free chapel, exempted from the ordinary jurisdiction of the bishop of Chichester, and continued collegiate till the general dissolution. It is a large and handsome building, and the stalls, with ancient carvings over them, are still in being. It has also a very ancient monument, on which is a female figure, supposed to represent the daughter of king Canute, who was buried here. And some years since was found, by digging in this church, the head of a man in stone, the sculpture of the hair and features being still visible. It is twenty inches from the chin to the crown, and consequently the height of the statue, provided the proper proportions were observed, was near fifteen feet. It is not certainly known what this statue originally represented, but it is thought to have been one of the Saxon idols.

Midhurst, the next place of note we visited in this county, is a pretty large town, situated near a branch of the river Avon, fifty-two miles from London. It is a borough by prescription, governed by a bailiff chosen annually by a jury at the court-leet of the lord of the manor. It has sent members to parliament ever since the year 1311, and the fourth of Edward II. It is very pleasantly situated on a hill, at the foot of which runs the river above-mentioned. It sends two members to parliament, has a weekly market on Thursday, and every fortnight, on the same day, another for fat and lean cattle, sheep, hogs, &c. and two annual fairs, viz. Ladyday and Whitsunday, for horses and toys.

In the neighbourhood of this town is a beautiful seat called Cawdry, lately belonging to the viscount Montacute. It is situated in a valley, encompassed with lawns, hills, and woods, thrown into a park, the river running at the side, which renders the place very agreeable in summer, but makes it dampish in winter. The house is square, and at each corner is a Gothic tower, which have a very good effect, when viewed from the rising grounds. The hall is ciled with Irish oak, after the ancient manner. The walls are painted with architecture by Roberti, the statues by Groupé, the staircase by Pelegrini. The large parlour, or room at the

end of the hall, is painted by Holbein, where that great artist has described the exploits of Henry VIII. before Bologne and Calais; his landing at Portsmouth, his magnificent entry into London, &c. In the other rooms are many excellent pictures of the ancestors of the family, and other history paintings of Holbein, relating to their actions in war. The whole suit of rooms are stately, well-furnished, and adorned with many paintings. In the picture-gallery are the twelve apostles, as large as life; and in another very neat gallery, wainscotted with Norway oak, there are many whole-length pictures of the family in their proper habits. Here are also four history-pieces, two of which are copies of Raphael's marriage of Cupid and Psyche, besides several old religious and military paintings from Battel-abbey. The chapel is one of the finest of its kind, adorned in a very magnificent manner.

The park is very noble, having a great variety of grounds in it, and is well wooded with firs, pines, and other evergreens, which are grown to a large size; and here are some of the largest chestnut trees perhaps in England. The vallies in the park are well supplied with water, which keeps them in a constant verdure.

At Harting, about six miles west of Midhurst, was a house for lepers, founded by Henry Hoese, and dedicated to St. John the Baptist. And at Durford, about a mile to the north of Harting, the same Henry Hoese founded an abbey of Premonstratensian canons, in the year 1169, and dedicated it to the Virgin Mary and St. John the Baptist. In this monastery there were twelve monks only at the dissolution, whose revenues amounted to one hundred and eight pounds, thirteen shillings and nine-pence *per annum*.

Petworth, the next place we visited, is about seven miles to the east of Midhurst, and forty-six miles from London. It is a large, populous, and well-built town, situated on a fine dry ascent, in a healthy air. The church is spacious, and in one of the vaults several of the Piercies, earls of Northumberland, are buried. The rectory of this church is said to be worth seven hundred pounds a year. Here is a weekly market on Wednesday, and two annual fairs, viz. Holy Thursday, for black cattle, and the twentieth of November, for sheep and hogs.

Here is the magnificent palace belonging to the late Algernoon, duke of Somerset. It was the ancient seat of the Piercies, earls of Northumberland, and came into the Somerset family by one of his grace's ancestors marrying the sole heiress of the house of Piercy. The duke pulled down the ancient edifice, and on the site of it erected the present structure, which is considered as one of the finest in England. It had the misfortune of being almost demolished by fire a few years after it was finished, but was soon effectually repaired. The front is of free-stone, and adorned on the top with statues. The great stairs and apartments are truly noble, well-contrived, and richly furnished. The bagnio and offices are very elegant, and there is one vault near four hundred feet in length. But the avenues to the front want space; and as the west front, instead of looking into the park or gardens, had nothing but the old stables before it, the duke was obliged to pull down the old mews, the finest of their kind in all the south of England, though, by this means, he only opened a prospect over the adjacent country. The error was now conspicuous, though too late to be corrected. Had the structure been erected on the rising ground near the north side of the park, over-against the north wing of the house, the fore front would have faced the town, and the back front the park; whereas one of these advantages now lies on one angle, and the other opposite to one of the wings of the house. It is, however, a noble pile of building, and by far the finest in all this part of England. In the armory, they shew, among several other curiosities, a sword, said to have belonged to the famous Hotspur, and the date upon the blade seems to countenance the opinion. It is not so unwieldy as other ancient swords usually are.

From Petworth we directed our course towards the south-west, through a most delightful country, interspersed

perfed in a charming manner, with woods, corn-fields, meadows, villages, and gentlemen's feats; till we reached Arundel, a very ancient town.

Arundel is fituated in a valley or dale, on the banks of the river Arun, fifty-five miles from London. It is a borough by prefcription, having fent members to parliament ever fince the thirtieth year of Edward I. and is fo ancient, as to be mentioned in king Alfred's will. It is governed, according to a charter of queen Elizabeth, by a mayor, twelve burgefles, a fteward, and other officers. The mayor, who is chofen annually, is judge of the court-leet of the lord of the manor, which is held every three weeks: he appoints collectors of the package and ftallage, ale-conners and ale-tafters. No writ can be executed within this borough without his permiffion, and he has the authority of a juftice of the peace, though he feldom executes the office. The church is a large, ancient ftructure, and had once a cell of four black canons, fubject to the monastery at Seez in Normandy, and fupposed to have been founded by Roger de Montgomery, earl of Arundel, in the reign of William the Conqueror; but in the reign of Richard II. it was abolifhed, and the church made collegiate, and continued fo till the diffolution, when its revenues amounted to two hundred and fixty-three pounds, twelve fhillings and nine-pence *per annum*. There is now nothing remarkable in this ftructure, except four old and ftately monuments of the earls of Arundel.

In the time of Edward II. here was alfo an houfe of Black-friars; and likewise an hospital, founded about the eighteenth year of Richard II. by Richard earl of Arundel. It was dedicated to the Trinity, and endowed, at the fuppreffion, with yearly revenues amounting to eighty-nine pounds, five fhillings and two-pence.

The town is pleafantly fituated at the foot of a hill, on the fummit of which is an ancient caftle, faid to be a mile in compafs, and to have been built very early in the Saxon times. It was conferred by William the Conqueror on Roger de Montgomery, who repaired it, and was created, by the above prince, earl of Arundel and Shrewfbury, but took his title from Arundel caftle, where he refided; and his fucceffors long enjoyed it as a local dignity, together with the caftle; but the title being afterwards difputed, it was declared by act of parliament, in the reign of Henry VI. that all perfons who had been, or fhould be poffeffed of the caftle and honour of Arundel, were, and fhould be earls of the fame, without any other creation; and accordingly the title, manor, and caftle, ftill continue infeparable.

During the civil wars, the caftle being in poffeffion of the parliament forces, was taken for the king, after a fiege of three days, by lord Hopton, and retaken by Sir William Waller, when the famous Chillingworth, who was an excellent engineer, as well as a great divine, ferved in the former capacity.

Arundel fends two members to parliament, has a fubftantial wooden bridge over the river; two weekly markets on Wednesday and Saturday, and four annual fairs, viz. the fourteenth of May, for black cattle and hogs; the twenty-firft of Auguft, for hogs, black cattle, and fheep; the twenty-fifth of September, for black cattle and fheep; and the feventeenth of December, for cattle and pedlars ware.

At Tortington, near Arundel, lady Hadwifa Corbet, founded a priory of five or fix regular canons, fome time before the reign of king John, and dedicated it to St. Mary Magdalen. At the diffolution, its annual revenues amounted to feventy-five pounds, twelve fhillings and three-pence.

At Lymifter, in the neighbourhood of Arundel, was an alien priory of Benedictine nuns, a cell to the nunnery of Almanefche in Normandy, founded before the year 1178, and dedicated to St. Mary Magdalen.

At Hardum, a village fituated on the river Arun, north of Arundel, there was an ancient priory of black canons, dedicated to the Holy Crofs; but the founder is now unknown.

At Pynham, near Arundel, queen Adeliza, fecond wife to Henry I. founded a priory of black canons, dedicated to St. Bartholomew. This was one of the fmall

monafteries fuppreffed by cardinal Wolfey, towards endowing his college at Oxford.

Leaving Arundel, we continued our courfe to the eaftward; in order to vifit Shoreham; and in our way paffed through Terring, a fmall market-town, fifty-three miles from London; but has nothing worth mentioning, except a charity-fchool, a fmall market on Saturday, and two annual fairs, viz. the fifth of April, and the fecond of October, for pedlars ware.

New Shoreham is a borough-town, fituated near the mouth of the river Adur, fifty-five miles from London, and took its rife from Old Shoreham, now a village to the north of it. The mouth of this river was the ancient Portus Adurni, whence large fhips ufed to go up as high as Bramber, two or three miles from the fea, till the navigation was choaked up with fand-banks. Here Ella the Saxon landed with fupplies from Germany, drove the Britons into the great wood, now called the Weald, and eftablifhed the kingdom of the South Saxons.

New Shoreham is a borough by prefcription, having fent members to parliament ever fince the twenty-fixth of Edward I. and is governed by two conftables. Great part of the town has been wafhed away by the fea, but it is ftill a populous place, and has been lately very confiderably improved. Here is a custom-houfe, with a collector and other officers to take care of the revenue, there being a good harbour for veffels of confiderable burden, and a tolerable trade. The parifh-church, which was formerly collegiate, was fome years fince thoroughly repaired and beautified at the expence of the inhabitants. Many fhips are built here, both for the navy and merchants fervice, which renders the place full of people, who are all generally employed. The fhip-wrights and fhip-chandlers, rope-makers, and other tradefmen depending on that bufinefs, feem to have fettled here chiefly on account of the prodigious quantity and cheapnefs of timber in the country behind them, which is in a manner covered with it; and the river, though not navigable for veffels, ferves to bring down the timber in floats from the adjacent woods.

Here was formerly a priory of Carmelites, or White-friars, founded by Sir John Mawbray.

New Shoreham fends two members to parliament, has a market on Saturday, and a yearly fair, on the twenty-fifth of July, for toys.

Bramber is fituated on the river Adur, fifty-two miles from London. It is an ancient borough by prefcription, governed by a conftable chofen annually by a jury at the court-leet. It is feparated into two parts: the north part, which joins to Stening, confifts of poor mean buildings, and is half a mile diftant from the fouth divifion of the town, which is diftinguifhed by the name of Bramber-ftreet. From the year 1279 to 1472, it was joined with Stening in the writs for electing burgefles to parliament; but fince that time, each borough has had feparate elections: the customs of both are, however, ftill the fame. On the north-weft of Bramber-ftreet are the remains of an old caftle, and fome of the walls, of a vaft thicknefs, are ftill ftanding. It is beautifully covered with ivy, and is a fine object viewed from the diftant hills. Here are alfo the ruins of a bridge, and other public buildings, which fufficiently indicate, that Bramber was once in a more flourifhing condition than it is at prefent. Though this place fends two members to parliament, it has neither market nor fair. Here was an ancient hospital dedicated to St. Mary Magdalen, and called Bidlington Spitel; but its revenues were very inconfiderable, being valued, on the diffolution, at no more than twenty fhillings *per annum*.

Near Findon, five miles weft of Bramber, is an ancient camp called Cæfar's Hill, upon which the very spot is pointed out where Cæfar's tent flood; but the form of the camp being round, not quadrangular, as the Roman camps always were, it is generally believed that this was either a Britifh or a Danifh camp.

Stening, or Steyning, is another fmall town adjoining to Bramber. It has at prefent not above two hundred houfes, though it is faid to have been formerly a very large town, and even a county of itfelf. It is,

however,

however, an ancient borough by prescription, and governed by a constable, who is the returning officer at elections, and chosen annually at the court-leet of the lord of the manor. The town is situated in a very fine air, and has a free grammar-school, founded about the middle of the last century by Mr. Holland, a tradesman of this place.

Stening was a place of some note in the Saxon times, on account of a church or monastery in which St. Cudman was buried. Here was also a priory of Benedictine monks, founded by Edward the Confessor, and dedicated to St. Mary Magdalen. William the Conqueror made it subordinate to the abbey of the Trinity at Feschamp in Normandy. Upon the dissolution of alien priories, it was given to the monastery of Sion in Middlesex.

This town sends two members to parliament, has a weekly market on Wednesday, and on the second Wednesday in every month, for cattle; besides two annual fairs, the first held on the ninth of June, for cattle and pedlary ware; and the second, which is reckoned one of the greatest in Suffex, on the tenth of October, for seed-wheat, Welsh cattle, sheep, hogs, and horses.

At Seal, near Stening, William de Braiosa founded, in the year 1057, a convent of Benedictine monks, subordinate to the foreign abbey of St. Florence at Salmur, but it was afterwards annexed to the college of St. Mary Magdalen in Oxford.

Leaving the borough of Steyning, we continued our course to the northward, near the banks of the Adur, to Horsham; and could not help admiring the vast quantities of timber growing in this part of the county. The plains also, during the summer season, are covered with the most beautiful verdure, and the roads remarkably good, though in the winter almost impassable.

Horsham is one of the largest towns in Suffex, situated near the eastern source of the Arun, thirty-five miles from London. It has its name from Horfa, the brother of Hengist the Saxon, who resided here. It is a borough by prescription, having sent members to parliament ever since the thirtieth year of the reign of Edward I. and governed by two bailiffs chosen annually by a jury at the court-leet of the lord of the manor. The church is an elegant and spacious building; and the hall, where the assizes for the county are often held, very commodious. Here is a well-endowed free-school, and in the neighbourhood a quarry of excellent stone. The county gaol is also here.

This town sends two members to parliament, has a weekly market on Saturday, and three annual fairs, viz. Monday before Whitsunday, and the eighteenth of July, both for sheep and lambs; and the twenty-seventh of November, for cattle and pedlars ware.

At Billinghamurst, a little to the south-west of Horsham, are noble remains of the famous military way made by the Romans, and called Stone-street.

From Horsham we passed through the forests of St. Leonard and Worth, to East Grinstead, so called to distinguish it from another place called West Grinstead, situated about ten miles from it in the rape of Bramber. It is situated near the source of the Medway, on the borders of Surry, twenty-nine miles from London; and is an ancient borough by prescription, having sent members to parliament ever since the first year of the reign of Edward II. It is governed by a bailiff, chosen by a jury of burgage-holders at the court-leet of the lord of the manor. The members are elected by the burgage-holders, who do not exceed thirty-five in number, and returned by the bailiff. Here is an hospital, built in the reign of James I. by Robert Sackville, earl of Dorset, who endowed it with an annual revenue of three hundred and thirty pounds, for the maintenance of thirty-one poor persons of this town. The county assizes are often held here; but the road from London to Lewis and Bighthelmstone passing through this town, is its principal support.

East Grinstead sends two members to parliament, has a weekly market on Thursday, besides another held on the last Tuesday of every month, for all sorts of cattle; and two annual fairs; the first is held on the eleventh

of June, for black cattle; and the second on the eleventh of December, for cattle and pedlars ware.

Leaving East Grinstead, we took the road to Bighthelmstone, passing through a number of small towns and villages, but saw nothing remarkable, till we came to the top of the South-downs, from whence there is the most extensive and beautiful prospect that can be imagined; on one side a beautiful country, finely variegated with meadows, corn-fields, and woods, interspersed with towns, villages, and gentlemen's seats; and on the other, an unbounded view of the British channel, rendered still more pleasing by the number of ships and vessels passing up and down that famous streight, and to and from the several harbours on the coast.

Bighthelmstone is situated on a bay of the sea, fifty miles from London. It is a large, ancient, and populous town, chiefly inhabited by fishermen, who often go from hence to the fishing-fair at Yarmouth, on the Norfolk coast, and hire themselves for the season to catch herrings. The town is inclosed with a wall fourteen or fifteen feet high, in which are four gates built of free-stone by queen Elizabeth, and fortified on the side facing the sea by another wall, in which are port-holes for cannon. It has seven streets, and as many lanes; but the church is situated without the town. Here are two public rooms, one of which is as elegant and convenient as most of the kind in England. Here are also a free-school, and two considerable charity-schools, one for fifty boys, and the other for twenty girls. The town-hall, which has a dungeon under it, faces the sea. Before it is the gun-garden, and in the walls of the structure are several arched rooms, where the stores are kept.

The French have several times attempted to destroy this town; but its situation being low, their cannon-balls generally went over it. But the place has suffered greatly by inundations and encroachments from the sea, by which upwards of one hundred and thirty houses have been destroyed within the space of forty years; and it is feared the whole town will in time be swallowed up by the sea.

The advantage of the situation of Bighthelmstone, which is dry, healthy, and open, finely diversified with hills and vallies, has, within these few years, occasioned a great resort of the principal gentry in the southern parts of England to this place, and engaged many of them to make it their summer residence; but of late, Bighthelmstone is become the public resort of valetudinarians, for bathing in the sea, the water of which, at this place, is said to contain more salt than the sea-water of any other port in England. At the same time, the bay, in which the town is situated, is open, and exposed to the sea, free from ooze or filth of any kind; and the beach is composed of clean gravel and sand, and has a gradual descent.

A mineral spring was also discovered here some years ago, the water of which began to be much drank on the spot in the summer of the year 1760. It is found to deposit an ocherous sediment; and a course of it, judiciously varied, is supposed to restore infirm habits.

The trade of this town is but small, though the place is now in a very flourishing condition, by the great resort of gentry to it during the summer season. Many small barks are built here for the merchants of London, and those at other ports; and prodigious flocks of sheep are fed on the neighbouring hills, the wool of which is said to be the finest in England.

Here is a weekly market on Thursday, and two annual fairs, viz. Holy Thursday, and the fourth of September, for pedlars ware.

On the west side of this town, a great number of human bones have been dug up; and from this circumstance it is concluded that a battle was fought here. Many are of opinion, that Cæsar, in one of his expeditions, landed at this place; and between Bighthelmstone are to be seen lines and intrenchments, which bear strong marks of their having been Roman works. In the neighbourhood of this town an urn was dug up some time ago, containing a thousand silver denarii, and some of all the emperors, from Antoninus Pius to Philip: nor are the altars of the Druids to be seen in

greater numbers any where than about Brightelmstone.

Lewis, which we next visited, stands on the banks of the Ouse, fifty miles from London. It is a large and populous town, pleasantly situated in the middle of an open champain country on the edge of the South-downs. King Athelstan fixed two mints here; and in the reign of Edward the Confessor, it had one hundred and twenty-seven burghesses. It is an ancient borough by prescription, having sent members to parliament ever since the twenty-sixth year of the reign of Edward I. and is governed by two constables, chosen annually by a jury of the burghesses at the court-leet of the lord of the manor. It was formerly walled round, and defended by a castle, of which there are still some remains. The streets are broad, and many of the houses well built. It has two suburbs, one called Southover, which is the largest; and the other called Cliff, from its situation under a chalky hill. It has a very considerable trade, goods being brought up hither in boats from a tide-harbour about twelve miles from the town. Here are six parish-churches, and a free-school for twenty boys, who are taught, clothed, and maintained. On the neighbouring down are horse-races every summer, for the king's plate of one hundred pounds. Here are several elegant seats, belonging to the Pelhams, the Gages, the Shelleys, and other gentlemen of family and fortune, several of whose gardens join to one another.

In the year 1078, William de Warren, earl of Surry, and his lady Gundreda, founded in this town a priory of Cluniac monks, which was the first and principal house of that order in England. This priory continued till the dissolution of religious houses, when its revenues were valued at nine hundred and twenty pounds, four shillings and sixpence *per annum*. Here was also an hospital, said to have been erected by the founders of the monastery. It was dedicated to St. Nicholas, and at the time of the dissolution, had thirteen poor brothers and sisters. Here was likewise a monastery, dedicated to St. James, for thirteen poor brothers and sisters; and a priory of Grey-friars.

The soil in the neighbourhood of this town is reckoned the richest in this part of England; but the roads in general so very deep and dirty in the winter season, that the coaches are drawn by oxen.

This town is famous in history for the bloody battle fought between king Henry III. and his barons, when the former was defeated, and the latter plundered the place.

Lewis sends two members to parliament, has a weekly market on Saturday, and three annual fairs, viz. the sixth of May, for black cattle; Whitsun-Tuesday, for black cattle and horses; and the second of October, for sheep.

From a wind-mill in the neighbourhood of this town, is a prospect, which, for its beauty and extent, is hardly to be equalled in Europe; for it takes in the sea for thirty miles to the west, and an uninterrupted view of Bastead downs, which are above forty miles distant.

At Mawling, on the north side of Lewis, there was a collegiate church, said to have been originally founded by Ceadwalla, king of the West Saxons, who died in 688. It was dedicated to St. Michael, and, on the dissolution, its annual revenues were valued at one hundred and six pounds, ten shillings and two-pence.

Seaford, or Seaforth; is at present no more than a small fishing-town, but one of the cinque-ports, and sent members to parliament from the twenty-sixth of Edward I. to the twenty-first of Richard II. when the privilege was discontinued till the reign of Edward IV. when it was restored. It was incorporated in the twenty-fourth year of the reign of Henry VIII. by the style of bailiffs, jurats, and commonality of the town, parish, and borough of Seaford. The bailiff is chosen on Michaelmas day, and by himself, or deputy, holds a court every fortnight. The houses are built of stone and slate, and the place is defended by a convenient fort. It stands on the sea-shore, sixty-two miles from London. Here is a charity-school, and two annual fairs, but no market. The fairs are held on the thirteenth of March, and the twenty-fifth of July, for pedlars wares.

This place has suffered greatly by the depredations of foreign enemies. It was attacked in 1560 by the French, but they were repulsed by Sir Nicholas Pelham.

About eight miles to the eastward of Seaford, is that famous promontory called Beachy-head. It has its name from a remarkable beach thrown up by the sea, at the foot of a prodigious cliff or head-land. Upon this beach many ships have been lost in stormy weather, and the violence of the waves have formed several large caverns in the chalky rock. The cliff is reckoned the highest of any on the south coast of England, and projects over the beach in a very remarkable manner. It is divided into seven parts, and thence called by sailors the Seven Cliffs. The divisions, however, are not continued to the bottom of the cliff; they have all one basis, which ascends to a considerable height, the whole terminating at the top in seven separate summits, some of which are higher than others. This remarkable head-land may, in clear weather, be seen from the cliffs in the Isle of Wight.

At Wilmington, near Beachy-head, Robert earl of Moreton founded, in the reign of William Rufus, a priory of Benedictine monks, subordinate to the abbey of Grestein in Normandy; but in the reign of Henry IV. it was annexed to the cathedral church of Chester.

On the east side is the small town of Pevensey, or Pemsy, situated at the mouth of a little river, which here falls into the sea. It was once a good harbour, and some historians say William the Conqueror landed here. But however that be, here was once a noble castle built by that prince, the ruins of which are still to be seen.

Pevensey is now but a small mean place, inhabited principally by fishermen, the harbour being at present so choaked up with sand, that only small boats can enter. Here is no weekly market, and only one annual fair, which is held on the fifth of July, for horned cattle and pedlars ware.

Near the head of the river, which falls into the sea at Pevensey, is a small market-town, called Haylsham, fifty-three miles from London. It has nothing remarkable, except a small market on Saturday, and two annual fairs, viz. the fifth of April, and the third of June, both for cattle and pedlars ware.

At Michelham, near this town, Gilbert de Aquila founded, in the beginning of the reign of Henry III. a priory of black canons, dedicated to the Trinity, in which there were, at the dissolution, eight canons, whose revenues amounted to one hundred and sixty pounds, twelve shillings and sixpence *per annum*.

And at a place called Hotteham, in the neighbourhood of Haylsham, Ralph de Dena founded, in the reign of Henry II. an abbey of Premonstrantian canons, dedicated to the Virgin Mary and St. Lawrence; but the religious meeting with great inconveniencies here, removed, in the beginning of the reign of king John, to Begham, on the borders of Kent.

At Bustead, on the north-east of Haylsham, there was an hospital for five or six poor persons, founded agreeably to the last will of William Heron, dated in the year 1404.

Hastings, which was the next place we visited, is situated on a bay of the sea, sixty-two miles from London. It is said to owe its name to one Hastings, a Danish pirate who infested this coast, and built a fort here to secure his retreat. In the time of king Athelstan, a mint was established here, and it is still one of the cinque-ports. It has charters from Edward the Confessor, William the first and second, Henry the second, Richard the first, Henry the third, Edward the first, and Charles the second; and is governed by a mayor, jurats, and commonality. The corporation is exempted from toll, and has power to hold courts of judicature in capital cases.

It was at this town that William the Conqueror mustered his army, after he had burnt the ships which brought him over to England, being determined either to conquer or perish. But perhaps the true reason for destroying his fleet, was to prevent the necessity of dividing his army, which he must otherwise have done. About the year 1377, this town was burnt by the French, and soon after rebuilt, when it was divided into

two parishes, as it is at present. It stands in a valley between two hills, and consists principally of two large streets, with a parish-church in each, and several good houses; but its harbour, formerly so famous, is now reduced to a poor road for small vessels, having been choaked up with sand, though large sums of money have been laid out at different times to clean and support it. Here is a custom-house, with proper officers to take care of the revenue; and two charity-schools, for teaching between two and three hundred children. This town has sent members to parliament ever since the reign of Edward III. and on the adjacent hill, overlooking the town, was a strong castle, but now in ruins.

Hastings sends two members to parliament, has two weekly markets on Wednesday and Saturday, and three annual fairs, viz. Whitsun Tuesday, the twenty-sixth of July, and the twenty-third of October, for pedlars ware.

In the castle above-mentioned was a royal free chapel, dedicated to the Virgin Mary. It had a dean, and several canons, or prebendaries; and its revenues, at the dissolution of religious houses, amounted to sixty-one pounds, thirteen shillings and five-pence *per annum*.

Here was also a priory of black canons, as early as the time of Richard I. said to have been founded by Sir Walter Briet, but was destroyed by an inundation of the sea in the reign of Henry IV. Some time after, a new priory was erected near the town, which, at the dissolution, was endowed with an annual revenue of fifty-one pounds, nine shillings and five-pence.

In the neighbourhood of Hastings, that famous battle was fought in the year 1263, when king Henry III. and his son prince Edward, were taken prisoners by Simon de Montfort, earl of Leicester.

Battel, the next place we visited, has its name from the decisive battle fought here between William the Conqueror and Harold, where the latter, together with sixty thousand men, were slain. The conqueror, to make some atonement for the effusion of so much blood, erected, on the spot where the battle was fought, an abbey of Benedictine monks, to pray for the souls of those who fell in the action. The abbot had the privilege of wearing a mitre, and was impowered to save the life of any criminal he saw going to the place of execution. The abbey was also made a sanctuary for the greatest villains who should fly thither for protection. The building was near a mile in circumference; and the parts which still remain, shew it to have been once a very magnificent structure. The gatehouse is still entire, and converted into a place for holding the sessions, and other public meetings; and part of the abbey into an elegant seat. The revenues of this abbey, at the dissolution of religious houses, amounted to eight hundred and eighty pounds, fourteen shillings and seven-pence *per annum*.

The town of Battel stands in a valley, and is reckoned unhealthy, from its low situation. The incumbent of the church is called the dean of Battel; and here is a charity-school for forty boys. The town is still noted for making the best gun-powder in England, and perhaps in Europe. Here was formerly a market on Sunday, which was, by act of parliament in the year 1600, changed to Thursday. Besides which, it has another on the second Tuesday in every month; and two annual fairs, viz. Whitsun-Monday, and the twenty-second of November, for cattle and pedlars ware.

Near this town is a hill, with a beacon on it, thence called Beacon-hill; but its old name was Standard-hill, from having been the place where William the Conqueror first set up his standard of defiance the day before the battle already mentioned happened.

At Sidlecomb, about three miles from Battel, was a preceptory of Knights-templars, founded by Jeffery Say, about the beginning of the reign of Henry III.

At Hoo, a village on the south-west of Battel, Henry earl of Ewe, about the year 1110, founded a priory of Benedictine monks, as a cell to the abbey of Bec in Normandy.

At Rotherbridge, north of Battel, Alfred de Martino founded, in the year 1176, an abbey for Cistercian

monks, dedicated to the Virgin Mary. At the time of the suppression, it was inhabited by twelve monks, whose yearly revenues amounted to two hundred and seventy-two pounds, nine shillings and eight-pence.

Winchelsea, the next place of note we visited, is situated on the coast of the British channel, seventy-one miles from London. It is one of the Cinque-ports, and was built by Edward I. soon after a more ancient town of the same name, about two or three miles distant, which consisted of eighteen parishes, had been swallowed up by the sea in a terrible tempest, and at which time the surface of the earth, both here and on the Kentish coast, was considerably altered. The small part of Old Winchelsea which was not swallowed up by the sea, is now a marsh and meadow-land. The new town was originally encompassed by a rampart, and afterwards by a wall; but it hardly began to flourish, before it was sacked by the French and Spaniards, and soon after deserted by the sea, on which it immediately decayed. Since that fatal period, it has likewise lost its market, and all its trade; so that the streets are now a grass-plot, and there remains little more than the skeleton of what was once a large town. The streets, running at right angles, divided the town into four quarters, as they now call them. The stone-work of three of the gates is still standing, though they are three miles asunder over the fields; and in many parts of the town are capacious vaults arched with stone, for the reception of merchandize; together with many ruins of ancient structures, but so buried in the earth, that the plough, in many places, goes over the first floors of the houses, without the least obstruction. Here were formerly three parish-churches, of which there only now remains the chancel of one, which is still used for divine service, and is sufficiently capacious for the inhabitants. One of the above churches was dedicated to St. Leonard, in which was a statue of that saint, as patron of the town, holding a vane in his hand, which being moveable at pleasure, such persons as wished for any particular wind to bring their friends home from a long voyage, were allowed, on making the saint a present, to set it as they pleased; and such was the credulity of those times, that they were persuaded the wind would blow from that quarter.

Winchelsea is one of the Cinque-ports, governed by a mayor and three jurats; and its representatives in parliament are chosen by the freemen, who amount to about forty in number, and returned by the mayor. Upon the level relinquished by the sea, are the ruins of a castle built by Henry VIII. Here was a house of black friars, founded by Edward II. and also a house of grey friars.

This town had formerly a market on Saturday, and has still an annual fair, on the fourteenth of May, for cattle and pedlars ware.

Near this town are large marshes, which are defended from the encroachments of the sea by walls and large banks of earth, erected and kept in repair at great expence by the owners of the land.

Rye is situated about three miles to the north-east of Winchelsea, at the mouth of a harbour sixty-eight miles from London. It is an appendage to the cinque-port of Hastings, but enjoys the same privileges with the other cinque-ports, and has sent members to parliament ever since the forty-second year of Edward III. The corporation, which is only by prescription, consists of a mayor, twelve jurats, and the freemen of the place. The mayor is chosen out of the jurats by a majority of the freemen; but when a vacancy happens in the jurats, it is filled up by the mayor, either on the day of his election, or at the general yearly sessions.

The town is a peninsula, washed on the east and south by the sea, and on the north by the river Rother; and over that branch of the sea, on the south side of the town, called Tillingham-water, there was formerly a ferry, but now a bridge.

Rye stands on the declivity of a hill, with a delightful prospect of the sea. It is a populous town, and in the reign of Henry III. was walled and fortified by William D'Ypres, earl of Kent, and a tower still standing, in which is the town-gaol, is yet called by his name; some remains of the old walls are also still visible.

fible. The houses, in general, are well-built, of brick, but mostly in the old taste, though there are some very neat ones in the modern form. Here is one of the largest parish churches in England, a free grammar-school, erected and endowed in the year 1644, by Mr. Peacock, one of the jurats, and a charity-school for teaching and maintaining thirty children. There is likewise a small settlement of French refugees in this town, who are, for the most part, fishermen, and have a minister of their own, paid by the archbishop of Canterbury.

We have already, in our account of the inland navigation of Suffex, described the harbour of Rye, and enumerated the various attempts that have been made for restoring it to its original state, and therefore shall say nothing farther on that head. But must remark, that in January 1725-6, his majesty king George I. being overtaken by a storm in his passage from Holla:d, was obliged to land here; but the water in the harbour was so shallow, that the larger ships were unable to follow him.

Here is a store-house for planks, hops, and other merchandize, which was formerly a church belonging to a convent of White-friars, founded in the time of Edward III. and is still called the Friary.

The trade of this town consists chiefly in hops, wool, timber, kettles, cannon, chimney-backs, and other pieces of cast iron, manufactured at the iron-works at Bakely and Breed, the former four miles north-west, and the latter five miles fouth-west of Rye. The place is well supplied with good water, conveyed, through leaden pipes, from two conduits on the adjacent hills.

In the reign of Richard II. the French, taking advantage of the confusions then subsisting in the kingdom, landed, and burnt the town of Rye; but the inhabitants soon fitted out a fleet of ships, and, in conjunction with others from different ports, took seven of their ships richly laden.

This town sends two members to parliament, has two weekly markets on Wednesday and Saturday, and two annual fairs, viz. Whitfun Monday, and the tenth of October, for cattle and pedlars ware.

At Pleaden, on the north side of Rye, was an old hospital, dedicated to St. Bartholomew, under the government of the abbot and convent of Westminster, in the county of Middlesex.

At Rotherfield, near the source of the Rother, Berthwald, duke of the South Saxons, founded, about the year 800, a convent of monks, subordinate to the abbey of St. Dennis in France.

At Beauleigh, near Begham, on the borders of Kent, Robert de Thornham founded, in the year 1200, an abbey of Premonstratensian canons, but they soon afterwards removed to Begham. This abbey was dedicated to the Virgin Mary, and was one of the small monasteries suppressed by cardinal Wolsey, for the endowment of his colleges, when the yearly revenues of it amounted to one hundred and fifty-two pounds, nine shillings and four-pence.

Remarks on the SEA-COASTS of Suffex.

The coast of Suffex is one of the most dangerous parts of England. The Bill, or Point of Selsey, is almost wholly surrounded with rocks to a great distance from the shore. There is indeed a channel between them, called the Looe, through which ships may safely pass, provided the pilot be well acquainted with the place. But as this is rarely the case, ships keep at six or seven leagues distance from the shore, in order to avoid a large ledge of rocks called the Owers. At some distance from the shore are a ledge of rocks called the Mixen, and another called the Streets: the latter is supposed to have been the city where the cathedral once stood, and which has been since swallowed up by the sea. But however this be, the rocks are now very dangerous to mariners; and though they lie in lines parallel to one another, and about the breadth of a street asunder, yet there is not the least vestige of the remains of buildings, unless we can suppose the houses were composed of enormous rocks.

A little to the eastward of Selsey-bill, is a place called the Park, where ships may ride safely in northerly, and north-west winds. Vessels bound into Selsey, or Siddlefome harbour, often come to an anchor here, to stop till there is water sufficient for them over the bar, it being only a tide-haven.

About three miles to the eastward of Siddlefome harbour, are the Bagnor rocks. They extend to a very considerable distance from the land, and many ships have been lost upon them. Part of them, near the shore, are dry at low water, but the outward part of the ledge is always covered.

Seven miles farther to the westward is Arundel harbour, an account of which has been already given. About nine miles S. S. W. from the mouth of the harbour, is a bank called Eastborough-head, which is dry at low water, on spring-tides, near a furlong in length; but the whole sand is near three miles long. Ships therefore should not come nearer to this sand than when the water is twelve or fourteen fathoms deep, by which means they will avoid the danger.

From hence to New Shoreham the shore is free from rocks and banks of sand; but from the west point of that harbour there runs off a narrow riff of sand, over which ships may pass at high water; but the deepest water is near the east shore, where there are no banks: the harbour, however, has a bar before it, which often shifts, so that the greatest depth of water is sometimes on one side, and sometimes on the other. Upon the east point stand two beacons, which serve as marks for ships entering the harbour. On this bar there are eighteen feet at high water, but at low water not above three; in common tides, twelve feet at high, and four at low water.

Four miles to the eastward of Shoreham, is the town of Brighthelmstone, situated in a bay of the channel, but has no harbour. They heave the small vessels belonging to the town up upon the dry beach above the high-water mark, by means of crabs fixed on the strand for that purpose. Ships may ride safely in this bay in northerly, north-east, and north-west winds; but the southerly winds blow right upon the shore.

Nine miles to the eastward of Brighthelmstone is New-haven, into which ships of small burden pass with the tide; for the mouth of the harbour is dry at low water, and horsemen ride along the sands without the least obstruction.

On the west of Beachy-head is a tide-harbour called Crookmore-haven, the mouth of which is dry at low water, and often, after storms, a large bank of shingles thrown up before it, which remains till swept away with the land-floods. The water on the bar is fourteen or fifteen feet deep at high water on spring-tides, but not more than seven at other times. The vessels in the harbour lie a-ground at low water, near the mouth of the harbour; but higher up, they lie afloat. Ships often come to an anchor at a small distance from the harbour's mouth, where there is from seven to nine fathoms water.

Two miles S. W. from the point of Beach-head is a little shoal, upon which there is not above two fathoms and a half at low water, and therefore should be avoided by large ships: small coasting vessels indeed pass over it with safety at all times of tide. And four miles farther from the shore, and nearly on the same point of the compass, is another dangerous shoal, on which there is but seventeen feet at low water. Several men of war have struck upon this shoal, and received great damage.

On the east side of Beachy-head is a bay, into which the little river Autfin falls. The mouth of this river forms Pevensey harbour, which is now choaked up with sand, so that only small vessels enter it with the tide. In the bay before this haven many ships come to an anchor in westerly and north-west winds, the water being six or seven fathoms deep, and the bottom an oozy sand.

Hastings lies about 16 miles to the eastward of Beachy-head, at the bottom of a bay, into which two small rivers fall, which anciently formed a good harbour; but it is now choaked up with sand, and the small vessels are heaved up by crabs above the high-water mark, in bad weather. This bay is rocky, and therefore should be avoided

avoided by such as are unacquainted with the coast. There is, however, good riding in it with westerly and northerly winds, but those from the south-east blow right into the bay.

About seven miles to the eastward of Hastings is the harbour of Rye, which was once very capacious, but had been for many years choaked up with sand. The new harbour, which was opened in 1762, will receive ships of three hundred tons burden, but is far inferior to what the old harbour once was. On the east point of land, at the mouth of this harbour, are two white beacons, which serve as marks for ships to keep in the channel at the mouth of the harbour, which lies between two sand-banks stretching off to a considerable distance from the shore on each side, called the East and West Bars. When past these sands, and pretty near the east shore, another white beacon is erected on the west shore, as a mark for directing ships up the channel, which in some places is not more than two hundred yards broad, and the water from six to twelve feet at low water; but the tide rises four fathoms here at the new and full moon.

Before we conclude these remarks on the sea-coasts, we must observe, that horsemen may pass on the sands at low water from one extremity to another, or from the harbour at Rye to that of Chichester, without meeting with any interruption, except at the harbours of Shoreham and Arundel, the rest of the harbours being dry at low water, and the stream of the rivers sinking away in the sand.

Curious PLANTS found in Suffex.

Money-wort, *Numularia*, Ger. found in the fields near Terring.

Yellow Water-lilly, *Nymphaea lutea*, Ger. found in many of the rivers of this county, particularly in Arun and Rother.

Malt Satyrion, *Cynosorchis morio mas*, Ger. found in the meadows near Chichester.

Female Satyrion, *Cynosorchis morio femina*, Ger. found in the same fields with the former.

Male Satyrion Royal, *Archis palmata non maculata*, Ray, found in the moist meadows near Amberley, on the banks of the Arun.

Butterfly, or German Satyrion, *Orchis hermaphroditica*, Ger. found in the woods near Stanstead.

Wild Marjoram, *Origenum vulgare spontaneum*, found in the fields near Midhurst.

Bird's-foot, *Ornithopodium majus*, Ger. found in the fields near Petworth.

Broom-rape, *Orobanche flore majore*, J. B. found among the broom in the waste places near Stanstead.

Wood-pease, or Heath-pease, *Astragalus sylvaticus*, Ger. found on the heathy grounds near Liphock.

Moon-wort, *Lunaria minor*, Ger. found on the commons near Chichester.

Osmund Royal, *Filix floribus insignis*, J. B. found in the boggy parts of the common between Chichester and Arundel.

Red-poppy, or Corn-rose, *Papaver erraticum Rhæas*, sive *sylvestre*, Park, found in fallow grounds, and among the wheat in most parts of the county.

Wild Vine, *Papeira brava*, Dale, found in the hedges in various parts of the county.

Pellitory of the wall, *Parietaria*, Ger. found on old walls in several parts of the county, particularly near Lewis and Bramber.

Thorow-wax, *Perfoliata vulgaris*, Ger. found among the corn near Westbourne.

Butter-bur, *Petasites vulgaris*, Park, found in the marshy grounds near Amberley.

Hogs-fennel, *Peucedanum*, Ger. found near the sea-shore at Selfey, and other parts.

Spoon-wort, or Scurvy-grass, *Cochliaria*. Two species of this plant are found near the sea-coast, and on the marshes near the side of the harbours, in most parts of the county. We found both in plenty at Selfey, and along the marshes in Siddlestone harbour.

Water Plantain, *Plantago aquatica*, J. B. found on the sides of the brook near West-bourne.

Greek Valerian, or Jacob's Ladder, *Valeriana Græca*, Ger. found in the woods near Charleton.

Solomon's Seal, *Polygonata*, Ger. found in the woods near Stanstead.

Polypody of the Oak, *Polypodium quercum*, Ger. found on many of the oaks in the Weald.

Rough Spleen-wort, *Aspera mion*, Park, found in the woods near Bramber.

Marsh Marygold, *Caltha palustris, flore pleno*, C. B. found on the marshes near Chichester.

Sea Purslane, *Portulaca marina nostras*, Park, found in the salt-marshes near Selfey.

Self-heal, *Prunella vulgaris*, Park, found in the pasture-grounds near Chichester.

Penny-royal, *Pulegium regium*, Ger. found in great plenty near the springs on Hambrook common, about four miles from Chichester.

Buckthorn, *Rhamus cathartica*, J. B. found in the hedges near Petworth, and several other parts.

Squinancy-wort, *Synanchica Lugduniensis*, Ger. found on many parts of the South-downs.

Wild-rue, *Ruta montana*, Ger. found on the South-downs near Arundel.

Wild Thyme, *Thymus sylvestris*, Ger. found in vast plenty in most of the upland pastures, and on the downs of this county.

Wild Valerian, *Valeriana sylvestris*, Ger. found on the hills; and also in several watery places in this county: that found in the higher situations is reckoned the best.

ROMAN COINS, and other ANTIQUITIES found in Suffex.

We have already mentioned a great variety of Roman coins found in different parts of this county, together with the remarkable inscription and Roman pavement found at Chichester, and therefore shall not repeat them here; but there are some others, particularly two very remarkable pieces of antiquity, viz. a tessellated pavement, and a bath, in the neighbourhood of East-bourne, a small town near Beachy-head.

The meadow, in which the greater part of this tessellated pavement lies, is about a mile and a half to the south-east of Bourne. The field contains about four acres, and is of a triangular form. The southern side faces the sea, and only a few fishermen's cottages, and a public house or two, between them. On the north side of the meadow is a highway leading from Bourne to Pevensey; and the west side is separated from a large common-field belonging to the parish, by a fence of posts and rails. About the middle of this fence the pavement lies, about a furlong distant from the high-water mark.

In the common corn-field, west of the meadow, to the distance of half a mile, they often raise bits of foundations with their ploughs; and in dry summers they can perceive, by the different growth of the corn, all the tract of ground to be full of foundations.

The pavement was little more than a foot below the surface of the ground; what lay next it was a small sea-gravel; and the position of the pavement is nearly due east and west. It is seventeen feet four inches in length, and eleven feet in breadth. At first it seemed to have been bounded with a thin brick set on edge, about an inch above the Tesserae, so exactly strait and even, as if shut with a plane; and so well cemented, as to appear one solid brick. But on breaking up the outside of the pavement, it was found, that instead of bricks set on edge, as at first imagined, it was bounded by a border of bricks laid flat, and their edges, next the tesserae, turned up. These bricks were an inch and a quarter thick, something more than eleven inches broad, and full fifteen long, which could not have been less than seventeen before they were turned up at the ends. They were very firm, and not in the least warped, or cast in burning. Their ends were entirely covered with plaster half an inch thick, so hard, entire, and even, that it appeared like one stone quite round the pavement.

Next within the bricks there was a list or border of white tesserae, thirteen inches broad; within that a list of

brown tesserae, four inches broad; then another list of the white, five inches broad; next within that, a second list of the brown, four inches broad: all the rest of the pavement was set with white tesserae, without any ornament or figure.

When the ground about the pavement was dug, there was discovered an entire bath, sixteen feet long, five feet nine inches broad, and two feet nine inches deep. It was filled with rubbish of buildings, which seemed to have been burnt; hard mortar adhering to pieces of Roman brick, squared stones, and headed flint mixed with ashes and coals of wood. At the north-west corner of the pavement was the passage into the bath, three feet three inches wide; where the bricks which bounded the pavement were not turned up at their ends, but lay even with the pavement. At the distance of fifteen inches from the tesserae, there was a fall of two inches, to the landing-place out of the bath: the landing-place was also three feet three inches long, and two feet two inches broad; thence, by two stairs, was the descent into the bath; the length of the stairs was the same with the landing-place: the breadth of each stair was eleven inches, and the height of each something more than ten: the lowest stair was twenty inches from the farther side of the bath.

The whole work was very compact, and curiously put together; not in the least injured by time, nor the violence it must have undergone when filled up.

The pavement was secured on every side, and the edges of it rested on a very firm and neat-built wall, composed of Roman brick, squared stone, and headed flint, between five and six feet deep below the surface of the pavement, and full twenty inches thick. The bricks were not laid in regular courses, as in those parts of Roman buildings above the ground, but dispersed about the wall, without order. The top of the wall indeed was only fifteen inches thick, and covered with the bricks first mentioned, which bounded the pavement; but about fourteen inches below the top, there was a set-off on the inside of the wall, eight inches broad. The foundation of the pavement was not dug up to the bottom, but opened at one corner only, in order to discover how it was framed; for when bored through, it was found, that next the tesserae was a bed of very strong mortar, more than a foot thick; under the mortar a bed of clay two feet thick; and under the clay a firm foundation of brick. The surface of the clay was neatly pitched with small flint and stones, pointed at their lower, and headed at their upper ends.

This pitched work was exactly even with the set-off on the inside of the wall: on it was laid a bed of coarse mortar, of about nine inches thick: the skirts of this mortar rested on the set-off above-mentioned; it was composed of lime, a sharp, coarse sand, small pebbles, and bits of brick. Upon this bed was another of a finer composition, made with lime, a fine sharp sand, some kind of ashes, and the dust of bricks and potshreds. This bed was about half a foot thick, and both these beds nearly equal to Portland stone in hardness. Upon this upper bed the tesserae were set; they were placed on end; but so exact was the workman in setting them, that he used two sorts of cement; their ends standing in a cement of lime only, well-worked, while their upper parts were cemented with a fine grey mortar, consisting of fine sand, ashes, and lime. This grey cement every where filled the intervals at their heads, and was much harder than the tesserae themselves.

The tesserae, as we have already observed, were only of two colours, white, and a dark brown. They were harder than a glazed and well-burnt tobacco-pipe, and of a grit somewhat finer. The brown seemed to be of the same substance with the white, but coloured by art. They seemed to have been formed in a mould, and afterwards burnt. They were not of an equal size, but none exceeded an inch in length; the shortest were six tenths of an inch. Most of them equally made their whole length, but some were formed in the shape of a wedge, in order to be forced in where any interstices were left. The heads likewise were not all equal and alike, some being an exact square, some an oblong square, some

semi-lunar, but none triangular. The side of those which were square, was about four tenths of an inch; the longest side of those forming an oblong square, was something more than half an inch.

The bath was also formed and secured by a very compact wall of the same breadth and depth with that on which the pavement rested: the wall which sustained the north side of the pavement formed the south side of the bath. On the south side of the bath, from the east end to the end of the stairs, there was a solid seat, twelve feet nine inches long, very near ten inches broad, and fourteen inches high. The bottom, or floor of the bath, was made in the same manner as the pavement, excepting the tesserae, and the thick bed of clay; for under all there was brick, then a bed of coarse mortar, something more than a foot thick, and on it another bed of fine mortar, half a foot thick. The sides of the bath, the seat, and the stairs, were plastered over with the above fine mortar, about half an inch thick; all which were throughout so hard, compact, and smooth, that when first opened, the whole seemed as if it had been hewn out of one entire rock, and polished. At the bottom, in the middle of the east end, there was a drain or sink, something more than three inches long, and two deep: about four inches above it, there was another passage through the wall, of the same size. The latter seems to have been the passage through which the water was let into the bath, and the former that by which it was let out.

The ground was not opened on the north side of the bath, but at the east end of the bath and pavement, at the south side of the pavement, and at the west end of both, there seemed to have been several vaults or cellars, for there were very firm twenty-three inch walls continued every way. The bricks in this rubbish, which were all broke, had several degrees of thickness, from three inches to a little more than one. Some had one of their sides waved, some fret-wise, and others had roses on them well imagined. Two sorts of channelled bricks were also found, one like a trough, the channel three inches broad, and as many deep: the other sort had a cylindrical channel; so that when two were clapped together, they formed a tube of three inches in diameter.

On the south-west corner of the pavement, and five feet lower than its surface, a large space was discovered, paved with brick; but the ground was not removed to its extremity, so that the dimensions of it could not be ascertained. This paved place was every where covered with a coat about two inches thick, of ashes and large coals of wood. On this lay scattered, in a very confused manner, large pieces of the coarse mortar above mentioned, and lumps of the tesserae, in all respects like those on the pavement, and cemented as they were. There was, moreover, mixed with the ashes, large iron nails, hooks for doors, several small pieces of earthen ware, together with part of a human scull; and near it pieces of bones, not inclosed in any vessel, but loose; they were discoloured like those found in urns; so that, in all probability, the body they belonged to perished in the same flames that destroyed the buildings. There was no inscription found either on stone or brick; no statue, or other figure, except those on the bricks already mentioned; nor coin of any sort.

But something more than a furlong to the north-west of these remains of antiquity, in digging the foundation for a malt-house, a coin of Posthumus was found; and a little time after, in digging the foundation of a dwelling-house, another struck by Constantine.

MEMBERS of PARLIAMENT for this COUNTY.

Suffex sends twenty-eight members to parliament, two knights of the shire for the county, two citizens for Chichester, and two burgesses for each of the following boroughs; Horsham, Lewis, Midhurst, New Shoreham, Bramber, Stening, East Grinstead, Arundel; and two barons for each of the cinque-ports of Hastings, Rye, Winchelsea, and Seaford.

K E N T.

THIS county is bounded by Suffex and Surry on the west; on the north by the Thames; on the east by the straits of Dover, and on the South by the English channel: It is fifty-six miles in length from east to west, and thirty in breadth from north to south; and one hundred and sixty-six in circumference; containing one million two hundred and forty eight thousand acres, or one thousand five hundred and fifty square miles. It is divided into five lathes, which are subdivided into sixty-eight hundreds; containing two cities, one hundred and sixty-three vicarages, four hundred and eight parish-churches, thirty considerable towns, eleven hundred and eighty villages, near forty thousand houses, and two hundred and twenty thousand inhabitants. Maidstone, the county town, situated nearly in the centre of it, stands at the distance of thirty-six miles south-east of London.

The name of this county is still the same as it was in ancient times. Cæsar, Strabo, Diodorus Siculus, Ptolemy and others, call it Cantium; and some are of opinion that the Kintai of Herodotus were the Cantii of the ancients. The Saxons called it Cant-guar-land; the county of the inhabitants of Kent; but whence this name was originally derived is not agreed among the learned. Mr. Lambard, who has given a description of this county, is of opinion that the name Kent is derived from the word Caine, which, in the British language signifies a green leaf; and was applied to this county on account of its having been formerly much shaded with woods. Mr. Cambden conjectures, that it had its name from its situation and figure; being a large point or angle, into which Britain shoots out upon the south-east extremity. Such a corner in Scotland is called Cantir, the inhabitants of another point in that part of the island are, by Ptolemy, called Cantæ; and that the Cangani were possessed of such another corner in Wales. To this may be added, that the Cantabri were inhabitants of a corner in the country of the Celtiberians, who, as they were originally the same people, must have spoken the same language with the Britons; and that this county of Kent was, by all the old geographers, called Angulus, or a corner. The French also use the word Canton, for a corner; it is also used by the heralds in the same sense, and the provinces of Switzerland are, to this day, termed Cantons, or corners.

R I V E R S.

The chief rivers of this county are the Medway, the Stour, and the Darent.

The Medway, according to Mr. Lambard, took its name from its course through the middle of Kent, which it divides nearly into two equal parts, and might therefore be called Midway or Medway: but Mr. Cambden is of opinion, that the ancient British name of this river was Vaga, to which the Saxons added Med, and from Medvaga, compounded of those two words, the present name is derived. But however that be, the river rises in the Weald of Suffex, and entering this county near Ashurst, runs by Tunbridge, and thence continues its course towards Maidstone; and near Yalding receives a considerable addition to its stream by the junction of the Beula. After passing by Maidstone, it runs north-west to the city of Rochester, and then directing its course to the north-east, it divides into two streams, one of which falls into the Æstuary of the Thames at Sheerness, thro' a mouth called the West Swale; the other turns towards the south-east, and falls into the same Æstuary, through another mouth, called the East Swale; and the country included between these two arms of the Medway, is called the Isle of Shepey.

The Stour consists of two streams, distinguished by the name of the greater and the smaller Stour; both rise in the southern and woody parts of this county, called the Weald of Kent, and run north-east; the greater Stour thro' the city of Canterbury, and the lesser through Elham, a market town, and falling into one channel, called the Wantsume, are again divided into two other streams, one of which running north-west, falls into the German ocean, near Reculver, and the other south-east falling into the Straits of Dover, at Sandwich. These two branches cut off the north-east angle from the rest of the county, forming it into an island, called the Isle of Thanet.

The Derwent, rises near Westram, a market town in this county, and after running in a northern direction about five miles, is joined near Otford, by another stream, rising at the foot of Idle-hill. Thus augmented, it continues its course towards the north, passes by Dartford, falling into the Thames, about two miles below that town; after being joined near its mouth, by another stream, which rises near Arpington, and passes by St. Mary's Cray.

Besides these rivers there is another called Ravensbourne which rises near Keston, passes in a northern direction by Bromley, and falls into the Thames at Deptford.

Remarks on the INLAND NAVIGATION of Kent.

The river Medway is navigable for large ships to Rochester-bridge, and thence for vessels and barges of sixty tons burden to Maidstone, the tide flowing up to that town.

The distance between the mouth of the Medway, where the fort at Sheerness is erected, and Rochester-bridge, is between sixteen and eighteen miles. In this part of the river, the channel is so deep, the banks so soft, and the reaches so short, that it is one of the best and safest harbours in the world; and ships of eighty guns ride a float at low-water, within musket-shot of Rochester-bridge. Nor is there a single instance upon record, that any of the royal navy suffered here by storms, except in that dreadful tempest which happened in November 1703, when the Royal Catherine was driven on shore, where she sunk and was lost.

On the shore of this river are two castles, one at Upnor, which guards two reaches of the river, and is supposed to defend all the ships which ride above between that and the bridge; on the other side of the river is Gillingham castle, built for the same purpose, and well furnished with cannon which commands the river. Besides these there is a platform of guns at a place called the Swam, and another at Cockham wood. These were added since the Dutch made that memorable attempt on the men of war riding here, on the twenty-second of June, 1667. for at that time the river was left without defence, there being only four guns that could be used at Upnor, and scarce that number at Gillingham, the carriages being rotten and decayed; so that every thing seemed to invite the enemy to make the attempt. There were indeed about twelve guns at the isle of Shepey, where at present Sheerness castle stands; but these were soon dismantled by the Dutch, who sailed boldly up to Black-stakes with their whole squadron; and seven of their largest ships went as high as Upnor, where they did all the mischief in their power, carrying off with them the Royal Charles, a first rate of one hundred guns, burning the London; and several others, besides damaging most of the ships within the reach of their cannon.

But the principal fortification on this river is the castle at Sheerness, of which a more particular account will be given in our account of that place.

The tide of ebb runs very strong through Rochester-bridge, and most part of the way to Maidstone, where the navigation of the river terminates. A scheme was indeed formed for continuing the navigation of the river to its source in the Weald of Suffex, during the reign of king Charles II. and an act of parliament was passed for that purpose, but was unfortunately laid aside till the year 1740, when it was again revived, and an act passed for that purpose, intituled, "An act to revive, explain, and amend an act passed in the sixteenth and seventeenth years of his late majesty king Charles II. intituled, An act for making the river Medway navigable in the counties of Kent and Suffex."

The preamble to this act will point out some of the advantages expected from this navigation, when completed, and is to the following purpose: That the above-mentioned act of parliament of the sixteenth and seventeenth of Charles II. was never yet carried into execution, though by making the said river navigable, great advantages would, in all probability, accrue to the public, by reason of the large quantities of timber growing in the Wealds of Kent and Suffex, which is allowed to be the best in the kingdom for the use of the royal navy, and which now, from the badness of the roads in those parts, cannot be conveyed to any market, but at a large expence.

That therefore the present undertakers being desirous to begin, carry on, and complete the navigation of such part of the ancient river Medway, and streams falling into it, as run from Forest-row in Suffex, to Maidstone in Kent, this act incorporates them for that purpose, by the name of "The Company of Proprietors of the Navigation of the River Medway."

We must refer to the act itself for further particulars; and shall only observe, that when this work is completed, it will be of singular advantage to the public; not only for the excellent timber which it will be the means of conveying, at an easy expence, to proper markets, but also for the easy and speedy carriage of iron ordnance, balls, and other military materials; forged on or near that river, which, at some seasons of the year, cannot be brought through the wealds of the two counties; and for the carriage of wood, corn, grain, hay, hops, wool, leather, and all manner of provisions: as also lime, stone, and other commodities, to the great improvement of trade and commerce, and the more immediate advantage of the two counties of Kent and Suffex.

The Stour, which falls into the sea at Sandwich, is navigable but a little way above its mouth. Here was once a good harbour, where ships of considerable burden might ride in safety; but in the reign of queen Mary, a large ship, belonging to pope Paul IV. sunk in the channel, near the mouth of the harbour. This accident, the consequence of which might have been prevented by weighing the ship, gave opportunity to the sands and beach to choak up the mouth of the harbour in such a manner, that it could never after be restored to its original state. Small vessels and barges, however, still pass up it to Canterbury.

The mouth of the east branch of the Medway, called the East Swale, is also navigable for large vessels; and a creek runs from it up to Feverham, and another to Milton, both which are navigable for vessels of forty or fifty tons.

These are all the inland navigations in this county, except the Thames, which divides it from Essex, and of which a farther account will be given hereafter. There are indeed harbours, or rather piers, at Dover, Ramsgate, Margate, &c. But these, together with the once famous, now ruined harbours of Romney, Hithe, Falkston, &c. will be described in our remarks on the sea-coasts of Kent.

Ancient PRIVILEGES, &c. of the CINQUE-PORTS.

These ports were originally five, as the name imports, viz. Dover, Hastings, Hithe, Romney, and Sandwich, to which Winchelsea and Rye were afterwards added as

principals, and some others as members. Their situation on the eastern coast of England, towards France, rendered them of great importance with regard to invasions, and on that account were thought worthy of a particular regard by our kings. Accordingly, the following privileges were anciently annexed to them and their dependents. First, An exemption from taxes and tolls. Secondly, Cognizance of all courts, and a power to oblige all that lived in their jurisdiction to plead in their courts. Thirdly, A power to take tolls in their markets, and to punish offenders in their own bounds. Fourthly, A power to punish murderers and fugitives from justice. Fifthly, To have pillory and tumbrel, or cucking-stool. Sixthly, A power to punish foreigners, as well as natives, for theft. Seventhly, A power to raise mounds, or banks, on any man's lands, against the breaches of the sea. Eighthly, To appropriate to their own use all lost goods and wandering cattle, if not claimed within a year and a day. Ninthly, To have commons, and be at liberty to cut down the trees growing on them. Tenthly, To convert to their own uses such goods as they found floating on the sea, goods thrown out of ships in a storm; and goods driven ashore when no wreck or ship was to be seen. Eleventhly, To be a guild or fraternity, and to be allowed the franchises of court-leet and court-baron. Twelfthly, A power to assemble at Shipway, and hold a portmote or parliament for punishing all infringers of their privileges, making bye-laws, and appealing from the inferior courts. Thirteenthly, Their barons to have the privilege of supporting the canopy over the king's head at his coronation. Fourteenthly, To have a lord warden, having within his jurisdiction, in several cases, authority of admiral, and chancellor.

In recompence for these privileges, the Cinque-ports were to fit out fifty-seven ships, each manned with twenty-one men and a boy, with which they were to attend the king's service for fifteen days at their own expence; but if the state of affairs required their assistance any longer, they were to be paid by the crown. These ships were to be ready in forty days after a summons was sent for that purpose. The number of ships required for each of these was as follows: Dover, with its members, twenty-one; Sandwich, five; Hithe, five; Romney, five; Hastings, twenty-one.

Ancient CUSTOM of GAVELKIND.

The inhabitants of this county are said to have been the first in England that were converts to christianity; and by their courage and resolution, retained some privileges which the inhabitants of every other county lost, by a capitulation with William the Conqueror; particularly a tenure called Gavelkind, by virtue of which, first, every man possessed of lands in this county, is, in a manner, a freeholder, not being bound by copyhold, customary tenure, or tenant-right, as they are in every other part of England. Secondly, The male heirs, and in default of such, the female, share all the lands alike. Thirdly, The lands of a brother, if he have no legal issue, are shared by all the surviving brethren. Fourthly, An heir, when fifteen years old, is of age to sell or alienate. Fifthly, Though the ancestor be convicted of felony or murder, his heirs shall enjoy his inheritance; and this is alluded to by the Kentish proverb, "The father to the bough, and the son to the plough." But this privilege does not extend to treason, piracy, outlawry, or abjuring the realm.

AIR, SOIL, and NATURAL PRODUCTIONS.

This county is nominally divided into three districts, East Kent, West Kent, and South Kent; or, Upper Kent, Middle Kent, and Lower Kent. Upper, or East Kent, which is the north-east division of the county, is said to be healthy, but not rich. Lower Kent, or the southern parts, called also the Weald of Kent, are said to be rich, but not healthy: and Middle Kent, bordering upon London and Surry, is said to be both rich and healthy.

healthy. Great part of this county lying near the sea; the air is thick, foggy, and warm, though often purified by south and south-west winds; but the marshy parts produce dreadful agues. In the higher parts of Kent, the air is reckoned very healthy. The soil is generally rich, fit either for the plough, pasture, or meadow; and that part of the county which borders on the river Thames, abounds with chalk-hills, from whence not only the city of London, and parts adjacent, but even Holland and Flanders, are supplied with great quantities of lime and chalk; and from these hills the rubbish of the chalk is carried by water to the coasts of Essex, Suffolk, and Norfolk, where it is sold to the farmers as manure for their lands.

Kent affords some mines of iron, and abounds with plantations of hops, fields of corn, rape, saint-foin, madder, woad, and hemp; and orchards of cherries, apples, and other fruit. On the cliffs between Dover and Falkston, two considerable market-towns in this county, are plenty of samphire. The southern parts of Kent, particularly that called the Weald, are covered with woods of oak, beech, and chestnut-trees, which afford excellent timber for ship-building, and other uses. Here are also many woods of birch, from whence the broom-makers in and about London are abundantly supplied. All the sorts of cattle here are reckoned larger than in the neighbouring counties; and the Weald of Kent is remarkable for large bullocks. Here are several parks of fallow-deer, and warrens of grey rabbits. The county is well supplied with fish from its rivers, and the adjacent sea; and is particularly famous for large oysters.

Remarks on the HUSBANDRY of Kent.

As the soils in this extensive county are very various, so the husbandry varies in proportion. The country between London and Black-heath is finely variegated, richly cultivated, and exhibits a picture of the most pleasing kind: it is indeed almost one continued garden, interspersed with meadows, and a few corn-fields; and large tracts of it are let at five pounds per acre.

Between Shooter's-hill and Dartford, the husbandry is excellent. The land lets from sixteen to forty shillings per acre, but in general about twenty shillings. Their course of husbandry is, 1. pease, the pods of which are sent to the London markets, and the ground cleared soon enough to give it two ploughings for, 2. turnips; 3. barley, or oats, generally the former; 4. wheat: sometimes clover is sown with the barley, in which case wheat is the fifth crop. They reckon a good common crop to be six or seven quarters of wheat and spring-corn on an acre; a sufficient proof that the land is very good, otherwise such a quantity of wheat could never be expected after barley. The introduction of clover is indeed a better course; for that grass being mowed twice, must abate the rankness of the ground, which too often occasions a laid crop of wheat. Large quantities of saint-foin are sown in this district, many fields of which produce three tons of hay per acre. Day-labour about that neighbourhood, and indeed in most parts of the county, is one shilling and six-pence a day, and beer, the whole year round, except at harvest, when the price is two shillings, and provisions. The price of plowing an acre is eight shillings, of reaping wheat five shillings, mowing spring-corn, one shilling and four-pence, and of grass, one shilling and six-pence.

The soil about the hills in the neighbourhood of Gravesend, is, in general, sandy and gravel, but bears extreme good crops of oats, and tolerable crops of barley, with very fine clover and rye-grass. The land lets at about eight shillings per acre, including the wild parts of the hills, which are over-run with with grose and whins. Lucern is pretty much cultivated in the richer vales of this tract, where land lets from twenty to thirty shillings per acre.

But this county is particularly famous for its hops, very large plantations of which are found about Maidstone, but the most extensive in the neighbourhood of Canterbury.

The ground intended to be planted with hops is broken up at the beginning of winter: the plough goes first, and men follow it with their spades, with which they dig one spit deep in the furrows where the plough has passed, throwing up the earth thus dug; and thus continue to plow and dig till the whole is finished. In October they begin to plant, marking out the place for each hillock. The best form for hops, as well as the most pleasing to the eye, is the Quincunx, because that order gives greater and more air for the plant to flourish, than when the hillocks are in straight lines.

If the ground be poor or stiff, some good mould, or a compost of manure and earth, must be laid in holes a foot square where the hills are intended to be formed: the distance between the hills in dry, hot ground, need not be more than six feet; but moist or rich ground, eight or nine.

The ground being thus prepared, a sufficient quantity of hop-sets, or cuttings from the roots or branches of the main stock, and of the largest size, must be procured; they must be from eight to ten inches long, each having three or four joints. These sets are to be planted in square holes, one at each corner, and a fifth in the middle, raising the earth two or three inches about them.

If the hop-ground be worn out of heart, they dig about it in the beginning of each winter, and take away a quantity of old earth, which they supply with fresher and fatter. If the hops be in good heart, manuring and pruning are most adviseable. For this purpose they undermine all about, till they come to the principal roots; this done, taking off the earth from the roots, they find by the colour, &c. which are the new shoots, and which the old. All the latter they cut off, and then apply the new mould or manure.

Soon after the hops appear above ground, it is time to pole them. The number and dimensions of the poles are to be adjusted to the distance of the hills, the nature of the soil, and strength of the hop. The poles are to lean outwards, particularly towards the south, to receive the sun's beams; it being observed, that a leaning pole bears more hops than an upright one. In this some are very curious.

When the hops are two or three feet above ground, in April or May, they are to be tied with withered rushes, or yarn, to the empty poles; and at proper distances, so as not to hinder their climbing. Two or three strings are sufficient for a pole.

Some time in May, after rain, the hills are to be hoed up, and the weeds destroyed; and if the spring or summer prove dry, it is best to water them twice or thrice in a season. The curious infuse pigeon or sheeps-dung in the water, to render it more nourishing.

About Midsummer, when they begin to branch out, such as have not got up to the top of the pole should have their heads nipped off, or else be loosened from the pole, in order to branch the better.

Hops usually blow about the end of July, and the forward ones are ripe by the close of August. Their ripeness is known by their fragrantcy and their change of colour, by their being easily pulled off, and by the seeds growing brown.

Hops should be gathered when somewhat brownish, and that without delay. In order to this, they have bins (which need no description) to lay the poles across, and pick them into, which are easily moved to the different parts of the garden.

Hops should not be gathered when wet; and if dew or rain be on them, shake the pole to hasten their drying, unless over ripe; for then they will be apt to shed their seed, wherein consists their chief strength. The planter is generally careful to gather them dry.

As fast as hops are picked, they must be dried, which is generally done on a common malt-kiln, on a hair-cloth; but the best way is, to make a bed of flat ledges, an inch thick, and two or three inches broad, sawn, and laid across each other chequer wise, the flat way, about three inches distant. The ledges so entered are put into another, that the floor may be even and smooth. This bed may rest on two or three joists set edgewise; then cover it with large double-tin plates, soldered together

gether at each joint, and order the ledges so, before they are laid, that the joints of the tin may always lie over the middle of the ledge. Then fit boards about the edges of the kiln, to keep on the hops, only let one side be to remove for shoving off the hops. They may be very safely turned on this tin-bed, and with a small expence of fuel. Other fuel will serve, beside charcoal in this method; the smoke not passing through the hop, but through conveyances made for it at the several corners of the kiln.

To prevent not only a waste and injury to the hop, but also the expence of fuel and time, the upper bed, on which the hops lie, should have a cover to raise or let down at pleasure; which cover may be tinned over, that when the hops begin to dry, you may let down this cover within a foot, or less, of the hops, which will reflect the heat upon them; so that the uppermost will be as soon dry as the lowermost, and all equally dried.

After hops have lain a month or more to cool and toughen, they proceed to bag them.

The hop-planters in Kent esteem their whites preferable to those of any other county, as having a stronger stalk, and being better able to bear cold or heat. They are of more delicious flavour, and of a more beautiful colour.

The profits from plantations of hops are very great, notwithstanding the expence attending their cultivation, thirty, forty, and fifty pounds clear profit having often been gained for an acre.

The Isle of Thanet is remarkable for the great quantities of barley annually produced there, more than twenty thousand quarters being annually sent to London, besides what is sold at other markets. The chief manure used in that island, besides the dung of their cattle, is the *Alga Marina*, or sea-ore, which they spread upon their land without any preparation, or make a compost dunghill with that weed, animal dung, and the soil from ditches, &c. The land lets from ten to twenty shillings per acre: they plow twice for barley, and reap about five quarters on an acre.

Mr. Reynolds, a very ingenious husbandman at Adisham, about four miles S. W. of Canterbury, has made several valuable improvements in husbandry: one in particular, is the introducing a vegetable called the turnip-rooted Cabbage, which will, in all probability, prove one of the most valuable discoveries made in this useful art for many years. This plant is proof against the most intense frost ever known in this island, will flourish, without manure, on the poorest land, an acre of which will produce a much larger quantity of substantial food for cattle, than can be procured from turnips cultivated in the best soil. Half an acre of turnip-rooted cabbage, after being fed the whole winter, produced above seventeen tons of food in May, and maintained six milch-cows, one heifer, and one bull, sixteen days, with the herbage only. The roots afterwards kept one hundred and sixty-two tegs, (sheep of a year old) five and twenty days, in the utmost plenty. And it should be added, that this amazing crop was produced on land not worth more than eight shillings per acre. In the winter and spring season its stalks and leaves are little inferior to brocoli, and may be cut much oftener, and therefore not unworthy the attention of gardeners.

CITY, BOROUGHS, MARKET TOWNS, &c.

We entered this county at a village called Smallhith, by means of a bridge over the river Rother; and repaired to Tenterden, an ancient borough, sixty miles from London. It is a member of the cinque-port of Rye, to which it was annexed in the reign of Henry VI. It has had several charters, but is now governed by that of queen Elizabeth, by a mayor and jurats. Here was formerly a manufacture of cloth, and is still a free-school. The steeple of the church is remarkably lofty, and proverbially said to have been the cause of the Godwin sands, situated in the channel east of Sandwich. These sands were a tract of ground, part of the isle of Thanet, belonging to Godwin earl of Kent; but lying

very low, were defended from the sea by a strong wall, which required a continual care and expence to support it. This tract was afterwards given to the monastery of St. Austin at Canterbury; and the abbot, who was also rector of Tenterden, neglecting the wall while he was wholly employed in building this steeple, the sea broke in, covered the ground with sand, and tore down the wall in such a manner, that the lands could never be recovered.

Here is a weekly market on Friday, and a yearly fair on the sixth of May, for cattle and pedlars ware.

From Tenterden we directed our course towards the south, in order to visit Romney, and in our way passed through Appledore, situated on the banks of the Rother. It was once a considerable market-town, but now greatly decayed, and the market discontinued. The sea is said to have formerly flowed up to this town, which has still a court-leet, extending over town-borough and horse-borough. Here is also an annual fair held on the twenty-second of June, for cattle and pedlars ware.

Romney, called also New Romney, to distinguish it from an inconsiderable town within a mile of it, called Old Romney, once a large town, consisting of twelve wards, five churches, a priory, and hospital; at which time the sea came so close to it, that ships used to fix their anchors in one of the church-yards; but in the time of Edward I. it was deserted by the sea, and soon after by its trade and inhabitants, so that it has only one church. The new town, which is situated in a clean, healthy situation, on a gravelly hill, seventy-three miles from London, is one of the Cinque-ports, and governed by a mayor, jurats, and commonality. The two great meetings for all the cinque-ports are held here; and the members or appendages to this port are, Old Romney, Lidd, Bromehill, Orlaston, and Dungeness, which, by the constitution of the cinque-ports, was to fit out five ships of war.

An hospital for leprous persons was founded here by Adam de Chering, dedicated to St. Stephen, and St. Thomas, archbishop of Canterbury, in the time of Baldwin, archbishop of that see; which being decayed and forsaken in the year 1363, John Frauncys, then patron of it, re-established a master and one priest, in the nature of a chantry, which, in 1481, was annexed to St. Mary Magdalen's college in Oxford. The church of St. Nicholas in this town, with the chapel annexed, and some other churches in Kent, being appropriated to the abbey of Pountney in Normandy, a cell of monks belonging to that foreign abbey was placed here; but upon the suppression of alien priories, it was given by Henry VI. to All-Souls college in Oxford.

This town sends two barons to parliament, as one of the cinque-ports, has a weekly market on Tuesday, and an annual fair on the twenty-first of August, for pedlars goods.

Romney-marsh, in the middle of which New Romney is situated, is a large tract of country, twenty miles long and eight broad. In this district are two towns, New Romney and Lydd, nineteen parishes, and forty-four thousand two hundred acres of firm and fruitful land, the richest pasture in England, which fatten vast flocks of sheep, and herds of black cattle sent hither for that purpose from other parts, and sold in the markets of London, and elsewhere. The sheep are reckoned larger than those of Leicester and Lincolnshire; and their bullocks, especially those they call stalled or house-fed oxen, (from their being kept all the latter season within the farmers yards or stalls, where they are fed for the winter market) the largest beef in England. This marsh is supposed to have been once covered by the sea, and is considered as so unhealthy a part of the county, that, for the encouragement of such as are willing to inhabit it, all the towns within the limits of the marsh were incorporated by Edward IV. under the title of the bailiff, jurats, and commonality of Romney-marsh. They have a court every six weeks, to hold pleas for all causes and actions; and a power to chuse four justices of the peace, besides the bailiff, yearly among themselves, who are all vested with the same authority, and have the return of all the king's writs, the benefit of all fines and forfeitures, privileges

privileges of leet and law-day, exemption from toll and tax, scot and lot, fifteens and subsidies, with many other exemptions, which hardly any other place in England enjoys. Nor has the king any waste here, or title to wrecks, these being appropriated to the several manors next the sea. Besides these, there are laws established among the inhabitants, called the Statutes of Sewers, for regulating their several shores and interests in the pasturage, and for maintaining the banks and walls erected to keep out the sea; by which laws all the lowlands between the Isle of Thanet in this county, and Pevensey in Suffex, are governed; and at the same time, are a pattern for regulating all the low and marshy grounds throughout the kingdom.

In the reign of Edward I. Romney-marsh suffered terrible devastations from an inundation of the sea, when whole villages, with their inhabitants, were destroyed, the river Rother thrown out of its usual course, and a new channel opened for it near Rye in Suffex, through which it still passes. Before this misfortune, it washed Old Romney, and formed at that town an excellent harbour, which is now choaked up, and the place fallen to decay. Large trees are often discovered lying under ground in this marsh, as hard and black as ebony, but fit for use after being dried in the sun.

This marsh is the place from whence a set of smugglers, called Owlers, from their going out in the dusk of the evening, have, for many years, exported our wool to France.

Lydd, another town in Romney-marsh, is about four miles south-west of New Romney, and has its name from the Latin word *littus*, the shore, alluding to its situation on the sea-shore. It is a member of the cinque-port of Romney, and incorporated by the title of bailiff, jurats, and commonality. It is a populous place, has a good free-school, a weekly market on Thursday, and an annual fair on the twenty-fourth of July, for pedlars goods.

Near this town is the well-known cape called Dungeness, on which a light-house is erected for the safety of sailors.

Leaving New Romney, we continued our tour, along the sea-side, to Hith, another of the cinque-ports, situated near the sea, at the eastern extremity of Romney-marsh, sixty-seven miles from London. Its name is Saxon, and signifies a Port, though it now hardly deserves the appellation, the harbour being choaked up with sand. It rose on the decay of West Hith, which had a good harbour till about the year 1607, when the sea retired from it; but both these towns owe their origin to Limne, a small village in the neighbourhood, which had also once a very famous port, till it was shut up with sand.

Hith was at first incorporated by the stile of barons; afterwards the archbishop of Canterbury appointed a bailiff yearly, by whom, and certain jurats, the town was governed, till it received a new charter from queen Elizabeth, by the name of a mayor, jurats, and commonality. In the reign of Henry IV. this town suffered greatly by a pestilence, which was succeeded by a terrible fire, whereby two hundred houses were destroyed in one day. Soon after, five of the ships, which this town, as a cinque-port, was obliged to fit out for the service of the crown, were sunk, and one hundred of the crew perished. These misfortunes so dispirited the surviving inhabitants, that they were going to quit the place, but the king encouraged them to remain in it, by releasing them for a time from the service which the town owed him as a cinque-port. Here were formerly five parish-churches, though now only one, the rest being quite demolished. In a vault under the church is a surprising collection of several thousand skulls and bones piled up in a very neat manner; and on the heap an inscription, importing, that they are the remains of the Danes killed in a battle which happened near this place before the Norman conquest. The pile is twenty-eight feet in length, six in breadth, and eight in height. Here are two hospitals, one dedicated to St. John, and the other to St. Bartholomew. The latter was founded about the year 1236, for ten poor men, by Haimo bishop of Ro-

chester, a native of this place. They are both under the government of the mayor and jurats. Here is also a charity-school for thirty-eight boys. From hence to Canterbury is a paved military way, called Stoney-street, which is easily discovered to be a Roman work.

In April 1739, while ten persons, who came to take a view of the sea and adjacent country from the steeple, were waiting in the porch for the keys of the church, the steeple fell down, without hurting either of them. Had the keys been brought a few minutes sooner, they must all have fallen with the steeple, and would probably have been crushed to pieces, or buried under the ruins.

This town, as one of the cinque-ports, sends two barons to parliament, has a weekly market on Saturday, and two annual fairs, viz. the tenth of July, and the first of December, for horses, black cattle, shoes, cloaths, and pedlars ware.

About a mile distant from Hith is Saltwood-castle, a very strong seat belonging to the archbishop of Canterbury. The outward wall has towers and battlements, and is surrounded by a deep ditch. At the entrance are two large and lofty towers, and over the gate are the arms of archbishop Courtney, the founder. Within the first is a still stronger and higher wall, with a broad embattled parapet at the top. Within is a court, but the lodging-rooms are all demolished. The floor of the ruinous chapel is strongly vaulted. In the middle of the court is a large square well, thought to have been sunk by the Romans. Anchors have been dug up near this castle, whence some are of opinion that the Romans had an iron forge here; and others, that the sea formerly came up to this place.

Limne, already mentioned, stands about four miles to the westward of Hith. Here are still the remains of a castle, which included ten acres of land; and the ruins of Roman walls may be traced almost to the bottom of the marshes. It stands on the side of a hill, is a noble piece of antiquity, and there seems no doubt but it was the Portus Lemanis of the Romans, though its port, as well as those of both West and East Hith, are choaked up with sand; yet it has still the horn, mace, and other tokens of its ancient grandeur. It used to be the place where the lord warden of the cinque-ports was sworn, at his entrance upon his office. Several coins, and other Roman antiquities, have been found here.

Leaving Hith, we continued our tour, near the sea-coast, towards Folkstone; and in our way stopt at Sanguate-castle. It stands on the sea-shore, a little to the south of Folkstone, and was built by Henry VIII. at the expence of five thousand pounds, to defend the fishing-craft from the insult of privateers in time of war. There are several very good houses near the castle, the ramparts of which are mounted with heavy cannon.

Folkstone is a member of the cinque-port of Dover, and stands near the mouth of a tide-harbour, sixty-nine miles from London. It is incorporated, and governed by a mayor, jurats, and common-council. Here is a charity-school, founded by Sir Elias Hervey, for twenty boys, who are to be nominated by the mayor and jurats. The harbour has been greatly hurt by sand-banks, but still admits of small vessels. Before these misfortunes attended it, the place made a very considerable figure, having a large fleet of ships belonging to it; but is now reduced to a fishing-town, and has still several hundreds of fishing-boats belonging to it, which are employed in the season for catching mackerel for the London market. About Michaelmas the Folkstone barks, with others from the coast of Suffex, sail away to the coasts of Norfolk and Suffolke, to catch herrings for the merchants of Yarmouth and Leostoff.

Folkstone appears to have been a considerable town in the time of the Romans; from the great number of Roman coins and bricks frequently found here. It flourished also under the Saxons, when it had five churches, four of which were destroyed in the reign of Edward the Confessor, by earl Godwin and his sons.

At the south part of the town there was once a castle, built by Eadbald king of Kent, about a thousand years ago; which falling to decay about the year 1068, a fort was built upon the same foundation, out of the materials

of the old castle, the ruins of which are still visible. Upon a hill in the town, still called Castle-hill, there was a watch-tower, now in ruins.

About the year 630, Enswitha, daughter of Eadbald king of Kent, chusing a religious life, her father built here a church and nunnery, for the use of her and her companions. It was dedicated to St. Peter, and, according to some writers, was, in process of time, swallowed up by the sea; but others tell us, it was destroyed by the Danes, and afterwards, in the year 927, granted by king Ethelstan to the cathedral church of Canterbury.

After the conquest, Nigell de Munewell, lord of Folkstone, gave, about the year 1095, the church of St. Mary and St. Eanfwida, in this town, to the abbot and convent of Lonley in Normandy; in consequence of which, some Benedictine monks from that abbey were placed here, at first in the castle, and afterwards in a building erected near the church. This alien priory had the fate of all others of the same kind, that of being seized by the king during every war with France. It was, however, afterwards made denizon, and continued till the dissolution, when it was valued at forty-one pounds, fifteen shillings and ten-pence *per annum*.

Folkstone has a weekly market on Thursday, and an annual fair on the twenty-eighth of June, for pedlars ware.

From this town a long ridge of chalky cliffs extends to Dover, some of which have visibly sunk in the memory of man. On the border of one of these cliffs, in the neighbourhood of Folkstone, are the ruins of an old wall, thought to have been built by the Romans, which hangs over the precipice in a very frightful manner.

Dover, the next place we visited, is another of the Cinque-ports, and situated on the sea-shore, seventy-one miles from London. It is built in the form of a semicircle, at the foot of a large ridge of hills, in the narrowest part of the channel which separates England from France, the cliffs of Calais, on the French shore, not being above thirty miles distant. It was formerly walled round, and had seven gates, and is still a very populous place, being the situation of our packet-boats, which always go twice a week to France, unless prevented by bad weather. In the time of Edward the Confessor, when the town was in a flourishing condition, it was incorporated by the stile of the mayor, commonality, and the townsmen, called Burgessees. From these the mayor chuses his assistants, who being sworn to faithful service, are thence called Jurats, which name and office is now common to all the Cinque-ports. The members belonging to this port are, Folkstone, Feversham, St. John's, St. Peter's, Birchington, Kingsdown, and Kingwold, who are all liable to contribute to the expence of such service as may be required of their principal, the port of Dover, on any emergency. The courts of chancery, admiralty, &c. relating to the Cinque-ports, are held here, and the lord-warden of the Cinque-ports is also sworn into his office at this place.

The town is built at the foot of a semicircular range of chalky cliffs, which form a kind of bay or harbour, and consists chiefly of one street, near a mile long. We have already observed, that it was once surrounded by a wall, but no vestige, either of that or its gates, now remain. It had also once seven churches, which are now reduced to two, St. James's, where the courts belonging to the Cinque-ports are held, and St. Mary's. It has a custom-house and a victualling-office, but no other public building worth notice, though still a place of great resort; and a very considerable trade is carried on here, especially to the coast of France.

The cliffs which run out of the semicircular range are very lofty, and admitting the water between them, form the harbour, which formerly ran up farther into the land than at present, and anchors have accordingly been found above the town. A pier or mole is built at the mouth of the harbour at a very great expence, and answers the purpose extremely well for small vessels, but the water is too shallow to admit large ships. The broad beach which lies at the mouth of this valley, and was the harbour in Cæsar's time, is very delightful. A little above the pier is a modern fortification, consisting of four bastions.

But what is called Dover-castle, is a very large antique building, situated on the summit of a lofty cliff. It is said to have been begun by Julius Cæsar, and finished by Claudius. This castle takes up thirty acres of ground, and was once so well fortified, and of such importance, as to be reckoned the key of England; and accordingly, William the Conqueror, when he had an eye upon the kingdom, exacted an oath from Harold, that he should deliver this castle into his hands. It has been long neglected; but the walls, which are of a prodigious thickness, are still standing, though the greater part of the works are destroyed. Within the walls are the remains of a royal palace and chapel, with stables and other offices, the ruins of which shew the buildings to have been very magnificent. One part of the fortification still remaining, is a circular work, in which there is an old church, said to have been built by Lucius, the first Christian king in Britain, out of some fragments of the Roman buildings that had then fallen into ruins. It is erected in the form of a cross, with a square tower in the centre; but the windows seem to be of much later date than the rest of the building. At the west end of this old church are the remains of a Roman pharos or watch-tower. This building was used as a steeple, and had a pleasant ring of bells, which Sir George Rooke procured to be carried away to Portsmouth. Since which time, the lead which covered the roof has been taken away by order of the office of ordnance, so that this curious piece of Roman architecture is left exposed to the injuries of the weather. The Erpington arms are fixed against one of the sides, so that it seems to have been repaired in the reign of Henry V. when lord Erpingham was constable of Dover-castle. The castle is supplied with water by a well of a circular figure, three hundred and sixty feet deep: it is lined to the bottom with free-stone, and said to have been the work of Julius Cæsar. The water is raised from the well by means of a head-wheel, turned by a man.

In this castle are two very old keys, and a brass trumpet in the shape of a horn, said to have been kept here ever since the time of Julius Cæsar; but they rather seem to be the ensigns of authority belonging to the constable of the castle, or lord-warden of the Cinque-ports. Here is also a brass gun of the most curious workmanship, and reckoned the longest in the world. It was presented by the states of Utrecht to queen Elizabeth, and thence called her Pocket-pistol. This piece of ordnance is one and twenty feet long, requires fifteen pounds of powder, and will, they say, carry a ball seven miles.

Upon a rock, over-against the castle, are the remains of another watch-tower, built by the Romans, and called Bredensstone, by the vulgar Devil's Drop, from the strength of the mortar. Here the constable of the castle is sworn into his office.

The view of the sea, and objects on the beach, from the craggy and lofty cliffs on which the castle stands, is truly tremendous, and the best comment on it is Shakespeare's beautiful description of this prospect, in his King Lear:

Come on, Sir—here's the place—Stand still—How fearful
And dizzy 'tis, to cast one's eyes so low!
The crows and choughs, that wing the mid-way air,
Shew scarce so gross at beetles. Half way down
Hangs one that gathers samphire;—dreadful trade!
Methinks he seems no bigger than his head.
The fisherme; that walk upon the beach,
Appear like mice; and yon tall anchoring bark,
Diminished to her cock; her cock, a buoy
Almost too small for fight. The murmuring surge,
That on th'unnumber'd idle pebbles chafes,
Cannot be heard so high. I'll look no more,
Lest my brain turn, and the deficient sight
Topple down headlong.

The cliffs above Calais, on the coast of France, are plainly seen from hence; and the many ships passing and repassing through this famous strait, greatly enliven the prospect.

The town of Dover, in the time of its prosperity, had twenty-one wards, each of which, in consideration

of furnishing a ship of war for the service of the crown, and maintaining it forty days at their own expence, had a licensed packet-boat; and according to the tower records, the fare to France, in one of these packets, was thus settled in the time of Richard II. For a single passenger in the summer-time, six-pence, in the winter one shilling: for a horse in summer, one shilling and six-pence; in the winter, two shillings. The Watling-street, or Roman way, coming straight from Canterbury, enters this town at Bigin-gate; it passes over Barham-downs, where it is very visible.

Sometime before the year 640, king Eadbald built a chapel within the walls of the castle, in which he placed a college of twenty-four secular canons, who were removed down into the town to the old church of St. Martin, near the market, by Wicfred king of Kent, about the year 696. Here they continued above four hundred years, till the time of Henry I. when complaint being made of some irregularities, he gave their house, together with all their lands and revenues, to Corfoil, archbishop of Canterbury, who, in the year 1131, began the foundation of a new church, with an intention of settling there a convent of regular canons of the order of St. Augustine, from Martin, near Wimbleton in Surry; but dying before his scheme was completed, his successor, archbishop Theobald, about the year 1140, settled in it a prior and twelve Benedictine monks, who were subordinate to the monastery of Christ-church in Canterbury. But upon the dissolution, their revenues were valued distinctly from that abbey, and amounted to one hundred and seventy pounds, thirteen shillings and eleven pence *per annum*. Very considerable ruins of this priory still remain.

About the year 1141, an hospital for leprous persons was erected here, upon the solicitation of Osbern and Godwin, two monks of St. Martin, who made it subject to the disposal of the prior: it was dedicated to St. Bartholomew.

The hospital of St. Mary, called also *Maison de Dieu*, in this town, was erected and endowed for the relief of poor pilgrims, and several poor brethren and sisters, under the government of a master, in the beginning of the reign of Henry III. by Hubert de Burgo, earl of Kent. Upon the dissolution, its revenues were valued at two hundred and thirty-one pounds, sixteen shillings and seven-pence *per annum*. This hospital is now made a storehouse.

Dover, as one of the Cinque-ports, sends two barons to parliament, has two weekly markets on Wednesday and Saturday, and an annual fair on the twenty-second of November, for wearing apparel and haberdashery ware.

At Evering, a village near Dover, in the road to Eleham, there is sometimes a stream of water, without any visible head or spring, deep enough to carry a vessel of considerable burden. When this happens, the people in the neighbourhood consider it as the presage of some public calamity.

At Swingfield, near Dover, was an house of sisters of the order of St. John of Jerusalem, before the year 1180. There was also a preceptory of knights-templars before the year 1190, to which Sir Warenius de Valoniis, Sir Robert de Clotingham, Arnulph Cade, and others, were great benefactors. It became afterwards part of the possessions of the knights of St. John of Jerusalem, and, as such, was valued, upon the suppression, at eighty-seven pounds, three shillings and three-pence *per annum*.

In the neighbourhood of Dover are the remains of Bradsole, or Radegund's abbey. It was founded in the year 1191, by Richard I. or, as some say, by Jeffrey earl of Perch, and Maud his wife, for Premonstratensian monks, and dedicated to St. Mary and St. Radegund. At the dissolution, its yearly revenues amounted to ninety-eight pounds, nine shillings and two-pence.

Elham is a little market-town, situated on the smaller branch of the Stour, sixty-two miles from London. It is an obscure place, and has nothing remarkable, but a small market on Monday, and four annual fairs, viz. Palm-Monday, Easter-Monday, Whitfun-Monday; and the tenth of October, for horses, black cattle, and pedlars ware.

About three miles from Dover-castle is the famous head-land called the South Fore-land, on which a light-house is erected for the greater safety of mariners in the night. About six leagues to the northward, is another head-land or promontory, called the North Foreland, on which there is also a light-house. Between these two head-lands lies the famous road called the Downs, of which a particular account will be given in our remarks on the sea-coasts of Kent.

Between the South Foreland and Deal are two castles, built by Henry VIII. to guard the coasts, and called Walmor and Deal Castles; but neither of them has any thing particular, either in their construction or situation. They are both sea-marks, and, as such, of great use to ships that come to an anchor in the Downs.

The beach between Walmer-castle and Deal seems to have been the place where Cæsar landed in his first expedition, it being the first place to the north of Dover, where the shore can be ascended, and answers exactly to his assigned distance of eight miles. In his second expedition, he appears to have landed at Deal.

Deal is a populous and handsome town, a member of the port of Sandwich, and situated on the sea-shore, seventy-four miles from London. At this place most of the ships bound from foreign parts to London, or from thence to foreign parts, by way of the channel, generally stop; the former to dispatch letters to inform their merchants and owners of their arrival, and land their passengers; and the latter to take in fresh provisions, and receive the last orders and letters from their owners and friends. Sometimes, indeed, when the wind is fair, the ships pass through the Downs without coming to an anchor. The town carries on some foreign trade, and is of late considerably improved, to which the great resort of sailors from the ships in the Downs has not a little contributed.

Deal is called *Dala* by Julius Cæsar, who landed here in his second expedition, on the twenty-sixth of August, fifty-four years before the birth of Christ.

The sea-shore in this place is thrown up in ridges, resembling ramparts, which some suppose to have been done by the wind; but others, particularly Camden, think they were thrown up by Julius Cæsar, and the remains of his famous camp, within the fortifications of which he drew his ships, in order to secure them against tempests, and the attacks of the Britons. And it is further observed, in confirmation of the latter opinion, that the neighbouring inhabitants still call these ramparts *Rome's Work*, or the work of the Romans.

Deal has a charity-school for twenty-seven boys and girls, who are taught and clothed at the expence of the inhabitants, a weekly market on Thursday, and an annual fair on the tenth of October, for cattle and pedlars goods.

About a mile to the north of Deal is Sandown-castle, built by Henry VIII. It is composed of four lunettes of very thick arched work of stone, with port-holes for cannon. In the centre is a large round tower, having a cistern for saving the rain-water, at the top; and underneath, an arched vault, bomb-proof. The whole is encompassed with a ditch, over which there is a draw-bridge.

Sandwich lies about four miles to the northward of Sandown-castle, and at the mouth of the Stour, seventy miles distant from London. It is situated at the bottom of a sandy bay, and was formerly one of the chief sea-ports in England. It suffered greatly by the Danish wars; and it was here that Canute inhumanly slit the noses, and cut off the hands of the Englishmen who had been delivered as hostages to Swain, his father; and in 1217, it was burnt by Lewis king of France. They also plundered it, and set it on fire, after killing the mayor and other officers, in 1457. Not long after, it was ransacked by the earl of Warwick, when he assisted the duke of York against Henry VI. but it recovered itself soon after, by the settlement of some Walloons and Dutchmen, who flying hither for protection, set up a manufacture of cloth, and continued in a flourishing condition till its harbour was choked up with sand, as we have already observed in our remarks on the inland navigation of this county.

Sandwich has been one of the Cinque-ports ever since the reign of William the Conqueror; and the members belonging to it are, Fordwich, Deal, Walmer, Ramsgate, Sære, Stomer, and Brightlingsey; near Colchester in Essex. It is incorporated, and governed by a mayor, jurats, and commonality.

Sandwich was once walled round, and the wall is still standing on the north and west sides; on the south and east, it is defended by a rampart and ditch. Here are three churches, three hospitals, a custom-house, a quay, and a free-school, built out of the ruins of a Carmelite monastery, by Sir Roger Manwood, with an exhibition for sending out two scholars every year to Lincoln-college in Oxford. Here are also two charity-schools, one for twenty-five boys, and the other for twenty-five girls.

The chief trade of the town is in shipping and making malt, though it supplies the London markets with carrots, and the seedsmen with the greatest part of their stock of that seed for the kitchen-garden.

The monastery of Carmelites or White-friars, mentioned above, was founded, in the year 1272, by Henry Cowfield.

Sandwich, as one of the Cinque-ports, sends two barons to parliament, has two weekly markets on Wednesday and Saturday, and an annual fair on the fourth of December, for cloth, haberdashery, shoes, and hard-ware.

About a mile from Sandwich, on the banks of the Stour, is Richborough, which, in the time of the Romans, was a great city, and flourished under the Saxons. It had also a famous harbour before the port was choked up with sand, and was the place where the Roman forces usually landed, and where they embarked for the continent. It was called Rutupiaë by Ptolemy, Portus Rhotupensis by Tacitus, and Rhotupis Portus by Antoninus. Here the Romans built a castle, which was destroyed by the Danes, together with the city, the side of which is now a corn-field, where, when the corn is grown up, the course of the streets crossing each other may be easily discovered, the corn growing considerably thinner there than in other places. These crossings are, by the neighbouring inhabitants, generally called St. Augustine's Crosses. The walls of the city, on three sides, are nearly entire, and in some places twenty-five and thirty feet high, without any ditch. Here are also some remains of the old walls of a tower, built with flints and long bricks of the old British make, and cemented with lime, and a fort of sand, which is, by time, become as hard as a stone. Roman coins, both of gold and silver, have been found in this place.

Upon an eminence, in the way from hence to Sandwich, are the remains of an amphitheatre made of turf, supposed to have been designed for the exercise or diversions of the Roman garrison of Richborough.

Several tumuli are scattered about the adjacent country; and before the gates of Sandwich are two Roman tumuli, on one of which a windmill is erected.

At Eastry, on the south-west side of Sandwich, king Egbert, who died in the year 673, built, for his sister Ermenburga, a monastery dedicated to St. Ethelbert and St. Etheldred. Here was also a minstre erected to expiate the crime committed in murdering the above-mentioned saints, who were brothers to Domneva, and suffered death at this place.

From Sandwich we took the road to Canterbury, through a very pleasing country, and were often entertained with most beautiful prospects from the hills. On the top of one of them we had an extensive view of the course of the Stour, with several small vessels and barges passing up and down the stream. To the east was a view of the sea, terminated by the cliffs on the coast of France.

The city of Canterbury was called Durovernum by the Romans, a name which some derive from the British word Durwhern, a rapid river, from its being situated on a part of the river Stour, where the stream flows with great impetuosity. Historians tell us, that this city was built by one Rudhurdibras, a king of the Britons, upwards of nine hundred years before the birth of Christ, and called Caer Kent, or the city of Kent. But how-

ever that be, it is known to have been a city of importance in the time of the Romans, it being built by Antoninus, and a great number of Roman coins have been found here. There are also remains of military ways and Roman causeways, leading from hence to Dover, and the town of Limne near Hith.

After the Romans left the kingdom, Vortiger, king of the Britons, resided here, and resigned it to the Saxons, in whose time the chief magistrate was called a Prefect, afterwards a portreve, and in 1011, the king's provost of Canterbury.

At the time of the conquest, the jurisdiction of the king and archbishop lay intermixed; and though the archbishop had a mint, and other considerable privileges, yet the king enjoyed the supreme royalty till the time of William Rufus, who gave the city wholly and entirely to archbishop Anselm, and his successor, Lanfranc, held it without opposition.

This famous city, the capital of the county, and the metropolitan see of all England, is situated on the river Stour, which is here navigable for small vessels, fifty-six miles from London. It is a county by itself, and is governed by a mayor, a recorder, twelve aldermen, a sheriff, twenty-four common-councilmen, a mace-bearer, a sword-bearer, and four serjeants at mace. A court is held every Monday in the guild-hall for civil and criminal causes, and every other day for the government of the city. It is divided into six wards, which are denominated from its six gates, Burgate, Newingate, Ridingate, Worthgate, Westgate, and Northgate. The city, though it appears circular at a distance, is built exactly in the form of a cross, and consists of four capital freets, which centre at St. Andrew's church, in the middle of the city; and, including the cathedral and gardens, is about three miles in circumference.

The buildings, besides the cathedral, are neither grand nor elegant: there is, however, a good market-house, over which are rooms, where the mayor, aldermen, and other members, transact the business of the corporation: Here is a gaol for criminals, and a gallows is erected in a place called Winecheap, on account of a wine-market formerly kept there.

The cathedral church of this city was partly built in the time of the Romans, by Lucius, the first christian king of the Britons, who continued to worship here till they were driven beyond the Severn by the Danes; but about the year 600, when Ethelbert, king of Kent, was converted to christianity by St. Austin, he gave him this church, together with his palace, and the royalty of the city and its territories, upon which the archiepiscopal see was removed hither from London. This cathedral being now become the metropolitan church, Austin immediately repaired and consecrated it by the name of Christ-church. In the year 1011, the Danes risted and burnt the cathedral, together with the rest of the city; but king Canute caused it to be repaired, and presented his crown of gold to it. It did not, however, long maintain its beauty; for in the year 1043, it was again greatly defaced by fire. Afterwards Lanfranc, who was archbishop of this see in the reign of William the Conqueror, rebuilt it, together with the archiepiscopal palace, and dedicated it anew to the honour of the Holy Trinity; but in the reign of Henry I. it was dedicated again, in the presence of the king and queen, David, king of Scotland, and many of the bishops and nobility of both kingdoms, by the name of Christ-church. In 1174, it was again destroyed by fire, but was begun to be rebuilt in the reign of king Stephen, though not completed till that of Henry V.

It is a noble Gothic pile of building, five hundred and fourteen feet long, seventy-four in breadth, and eighty feet in height from the area to the nave of the canopy. It is in the form of a cross, with a lofty stone tower in the center, two hundred and thirty-five feet high. This tower is very beautiful, but the tower and spire at the west end are very mean. Before the reformation, this cathedral had no less than thirty-seven altars; and here lie interred the bodies of Henry IV. and his queen Joan, besides those of six other kings; those of Edward the Black Prince, and of other princes, cardinals, arch-

bishops,

bishops, and other great men, particularly St. Austin, and the seven following bishops who succeeded him, namely, Laurentius, Mellitus, Justus, Honorius, Deusdedit, and Theodosius: these are all interred in one vault.

But the glory of this church was the shrine of Thomas Becket, archbishop of Canterbury, who was murdered near the high-altar in the year 1171. This shrine was so rich, by the continual offerings made to it for several ages, that the celebrated Erasmus, who saw it, tells us, that not only the shrine itself, but even the chapel in which it was placed, and to which there was an ascent from the choir, glittered all over with jewels of inestimable value; and that through the whole church there appeared a profusion of more than royal splendour. Gold was one of the meanest treasures of this shrine; and Dugdale observes, that at the general dissolution of religious houses, the plate and jewels belonging to this tomb filled two large chests, each of which required eight men to remove it.

The metropolitan chair is of grey marble, and stands behind the high altar. The cloisters have nothing in them remarkable; but near them is a very large chapel, called the Sermon-house, wainscotted with Irish oak.

To this cathedral belong a dean, an archdeacon, twelve prebendaries, six preachers, six minor canons, six substitutes, twelve lay-clerks, ten choristers, two masters, fifty scholars, and twelve alms-men.

Underneath the cathedral is a large church of foreign protestants, given first by queen Elizabeth to the Walloons, who fled from Artois and other provinces of the Netherlands, from the persecution of the duke of Alva. This congregation has since been very much increased by numbers of protestants, who were driven from France in the reign of Lewis XIV.

The clofe, in which the dean and prebendaries have their houses, is very spacious, and the buildings elegant. It is full of religious ruins; and in one of the corners of it are the walls of a chapel, said to have been a christian temple before the time of St. Austin, to have been consecrated by him, and dedicated to St. Pancreas. Near it is a little room, supposed to have been Etheldred's Pagan chapel.

Besides the cathedral, here are sixteen parish-churches, but neither has any thing remarkable, except St. Martin's, which is said to have been St. Austin's first see, and the place whither king Etheldred's queen used to repair to divine service, before that monarch was converted to christianity. It is built chiefly of Roman brick; and in the middle of the church is a large old-fashioned front, said to be that in which king Etheldred was baptized. With regard to the church of St. Mary Castles, the chancel only is now standing, though there is still an incumbent presented and inducted to it.

Near the cathedral is a free-school, called the King's School; besides which, there are three charity-schools for fifty-eight boys and sixty-six girls. Here are also seven hospitals, one of which, called Bridewell, is both a house of correction, and a place where the boys of poor citizens are received. Here is a sumptuous conduit, erected by archbishop Abbot, who died in the year 1633, and is of great benefit to the city.

Canterbury was surrounded with strong walls, composed chiefly of flint, and fortified by a great number of towers, a deep ditch on the outside, and a rampart within. Here was also a castle, supposed to have been built by the Saxons, the decayed bulwarks of which still appear on the south side of the city.

A monastery was built here by Austin and his monks in the reign of king Etheldred, soon after he had given them his palace. It joined to the cathedral, and was thoroughly repaired by archbishop Lanfranc about the year 1080, and replenished with one hundred and fifty Benedictine-monks. At the dissolution, it was endowed with a yearly revenue of two thousand three hundred and eighty-seven pounds, thirteen shillings and three-pence clear.

King Ethelbert, upon the further persuasion of St. Austin, founded, in the year 605, another noble monastery here, and dedicated it to St. Peter and St. Paul;

but after St. Austin was buried here, it was called St. Austin's Abbey. The monks were of the Benedictine order, and were endowed at the dissolution with an yearly revenue of one thousand four hundred and thirteen pounds, four shillings and eleven-pence. Two gates of this monastery still remain, and are both very stately; perhaps one belonged to king Etheldred's palace, and the other to the monastery, which was doubtless very splendid, for it covers a large space of ground, and is surrounded with a high wall.

Near the remains of this monastery is a vast angular piece of a tower, above thirty feet high, which has been undermined by digging away a course at bottom, in order to throw it down; but happened only to force it out of its perpendicular direction, and it now stands in a declining position.

Without the north-gate of the city, Lanfranc, archbishop of Canterbury, founded, about the year 1084, an hospital for poor, infirm, lame, and blind men and women. It was dedicated to St. John the Baptist, and endowed with seventy pounds *per annum*. It was governed by a prior, and its revenues were valued, upon the dissolution, at ninety-three pounds fifteen shillings. It is still in being, and contains a master, reader, eighteen in-brothers, twenty in-sisters, and the like number of out-brothers and out-sisters. The revenue amount, in the whole, to one hundred and ninety-five pounds, eight shillings and nine-pence *per annum*.

In Northgate-street, over-against the hospital of St. John, archbishop Lanfranc also founded an house for secular priests, in the year 1084. It was dedicated to St. Gregory. Archbishop William, in the reign of Henry I. made it a priory of black canons. About the time of the dissolution, it was inhabited by thirty religious, who were endowed with a yearly revenue of one hundred and twenty-one pounds, fifteen shillings and a penny.

In the south-east part of the city was a Benedictine nunnery, founded by archbishop Anselm about the year 1100. It was called St. Sepulchre's, and had a prioress, and six or seven nuns, who, at the dissolution, were possessed of twenty-nine pounds, twelve shillings and five-pence *per annum*.

The hospital of Eastbridge, or Knightsbridge, still in being in this city, is thought to have been founded by archbishop Lanfranc: some think it was founded by Thomas Becket. But whoever was the founder, it was immediately after the canonization of the latter, called the Hospital of Thomas the Martyr. Archbishop Stratford did so much for it, as to be stiled the second founder. It was originally designed for the entertainment of pilgrims, and the revenues of it, upon the dissolution, amounted to twenty-three pounds, eighteen shillings and nine-pence *per annum*. It was preserved upon the reformation; but being in danger of sinking in the reign of queen Elizabeth, archbishop Whitgift recovered it, and made a set of statutes, which were confirmed by act of parliament, by which a master, a school-master, five in-brothers, five in-sisters, and as many out-brothers and out-sisters, are established here.

In the south-east suburb, on the right side of the way from this city to Dover, Hugh, the second of that name, abbot of St. Austin's, built, in the year 1137, an hospital for the relief of leprous monks, or the poor parents or relations of any of the monks of that abbey. It was dedicated to St. Laurence, and consisted of a warden, or keeper, a priest or chaplain, one clerk, and sixteen brethren and sisters; and the chief, or senior of these sisters, was sometimes called the prioress. On the dissolution, the revenues of this house amounted to thirty-nine pounds, eighteen shillings and six-pence.

In St. Peter's parish, almost directly opposite to the Black-friars gate, was an ancient hospital, called St. Nicholas and St. Catharine's, founded by one William Cockyn, a citizen of Canterbury; but this house was, about the year 1203, united to the neighbouring hospital of St. Thomas at Eastbridge.

The Franciscan, Minor, or Grey-friars, came into England in the year 1224. They were only nine in number, five of whom stayed at Canterbury, by the direction

rection of king Henry III. and there fixed the first house of their order, on a piece of ground near the poor priests hospital. John Diggs, an alderman, about the year 1270, translated them to an island, then called Bynnewith, on the west side of the city, where they continued till the dissolution.

Here was also a priory of Dominican or Black-friars, founded, according to some writers, about the year 1221, by king Henry III. There are still some remains of this convent.

Simon de Langton, archdeacon of Canterbury, founded, in the parish of St. Margaret, about the year 1243, an hospital for poor, infirm, and aged priests. At the dissolution, it was valued at twenty-eight pounds, sixteen shillings and a penny *per annum*; but continued undissolved till the seventeenth year of the reign of queen Elizabeth, when being surrendered up, the queen granted it, with all its lands and appurtenances, to the mayor and commonality of the city, for the use of the poor, and the site of it is now their Bridewell.

In the time of Edward I. the friars Heremites, of the order of St. Augustine, obtained a settlement and an house, in the parish of St. George, by the gift of Richard French, a baker; and king Edward III. and others, were afterwards benefactors to it.

Mangard's Spittle, in this city, was an hospital founded by the mayor and commonality, and by them endowed with lands and old leases to the value of five marks a year. Seven poor people were maintained in it in the year 1562.

At Tannington, without the city, there was an ancient hospital founded in the time of king Henry II. and dedicated to St. James. It sometimes consisted of a master or keeper, three priests, a prioress, and twenty-five leprous sisters, whose revenues were valued, upon the dissolution, at fifty-three pounds, sixteen shillings and eleven-pence *per annum*.

The foreign protestants who have been allowed to settle in this city, have been of great advantage to the place: they brought over with them the art of weaving broad silks, which has suffered many changes and alterations, but is still carried on to some account. But what adds most to the advantage of Canterbury, is the hop-grounds situated all round the city, to the amount of several thousand acres. This city is also famous for its bawn.

Canterbury sends two citizens to parliament, has two weekly markets, on Wednesday and Saturday; besides a market, toll-free, every Wednesday, for hops; and an annual fair on the twentieth of September, for toys.

At Cartham, a village upon the river Stour, about three miles south of Canterbury, as some persons were sinking a well in the year 1668, they found, at the depth of about seventeen feet, a parcel of petrified bones, of an uncommon size and figure; among which were four perfect teeth, almost as large as a man's hand. Some believed them to be the bones of a marine animal, which had perished there, from a supposition, that the long valley of about twenty miles, through which the river Stour runs, was once an arm of the sea. Some thought them to be the bones of an elephant, it being said that many elephants were brought into Britain by the emperor Claudius, who landed near Sandwich, and might probably pass this way in his march towards the Thames. The shape and size of these teeth are thought to agree with those of an elephant; and the depth at which they were found is accounted for, by the continual washing down of the earth from the hills.

At Hambledown, near Canterbury, archbishop Lanfranc erected and endowed an hospital for the relief of poor infected leprous persons. It was dedicated to St. Nicholas; and, on the dissolution, its revenues were valued at one hundred and twenty-two pounds, fifteen shillings and seven-pence *per annum*. It was not suppressed in the year 1574, when it consisted of fifteen in-brothers, and as many in-sisters, who had each four pounds yearly, besides two loads of wood. It had also the same number of out-brothers and out-sisters, who received one pound fourteen shillings a piece annually, the whole revenue being one hundred and sixty pounds. The governor was sometimes called the dean, sometimes the prior, and at present the master.

In the church of Hackington, near Canterbury, Baldwin, archbishop of that see, began a chapel in the year 1187, in which he proposed to found a noble college of forty secular priests; and designed that the king, and each of his suffragan bishops, should have a prebend, every one to be worth forty marks a year: but the prior and monks of Christ-church made such vigorous opposition to the design at the court of Rome, that after the archbishop had, during the succeeding year, settled some canons here, he was obliged to desist, and the chapel was, by the pope's command, levelled with the ground in the year 1191.

At West Langdon, not far from Canterbury, William de Auberville built, in the year 1192, an abbey for white canons, dedicated to the Virgin Mary and St. Thomas the Martyr, where, about the time of the suppression, there were eight religious, endowed with an annual revenue of forty-seven pounds, six shillings and ten-pence.

The manor of Patrickborn, situated on the Stour, about a mile and a half south-west of Canterbury, was, in the year 1200, given, by John de Pratellis, to a priory he had just erected at Beaulieu in Normandy; and he placed here some Austin canons, as a cell to that foreign monastery, with a power of alienating it to the priory of St. Martin in Surry, to which it was appropriated in the year 1258.

At Wingham, about midway between Canterbury and Sandwich, a college, consisting of a provost, and six secular canons, was settled, and endowed by John Peckham, archbishop of Canterbury, in the year 1286, the annual revenues of which were valued, on the suppression, at sixty-five pounds, one shilling and eight-pence.

Leaving Canterbury, we returned to Sandwich, and continued our tour along the sea-side, which is very pleasant in the summer season, and were agreeably delighted with the number of ships we saw passing and re-passing through the Downs. The first place we stopped at on this coast was Ramsgate, a small sea-port town, situated on the sea-coast. They are now building a very fine pier at this place, which, when finished, will be of the utmost service to navigation, as it will afford a safe retreat for ships in the Downs, when overtaken by a storm of wind at south-east. We shall give a more particular account of this pier in our remarks on the sea-coasts of Kent.

About four miles beyond Ramsgate is the famous promontory called the North Foreland, on which there is a noble light-house near eighty feet high. The sea gains here so much upon the land, that within the memory of some of the inhabitants, above thirty acres have been lost in one place.

About two miles to the westward of the North Foreland, is the town of Margate, which has greatly increased within these ten years past, on account of its being greatly frequented for the advantage of bathing in the salt-water, which is here done to great advantage in the sandy bay lying before the place. Here are very handsome public rooms, and a great deal of good company during the summer season; but the houses are meanly built, and the streets irregular. Large quantities of corn are shipped here for the London markets; most, if not all of it, being produced in the Isle of Thanet, in which Margate is situated.

At Stanar, in the Isle of Thanet, is the sepulchre of Vortimer, king of the ancient Britons; who having vanquished the Saxons in many battles, and at last drove them out of the island, ordered, before his death, that his body should be buried here, from a fond conceit, that his corpse would deter them from landing any more on the coast. So the great Scipio, who having subdued the Carthaginians, ordered his tomb to be turned towards Africa, to frighten them from the coast of Italy. But the poor Britons soon found that the charm had no effect, and that their king had lost his power with his life.

In this island also is a place called Minstre, where Domneva, niece to king Egbert, built and endowed a monastery, dedicated to the Virgin Mary, in which she placed

placed her daughter St. Mildred, abbess over seventy nuns. This abbey was plundered and burnt, and the nuns and clerks in it murdered by the Danes several times; particularly, in the years 980 and 1011; but after this, there were no more nuns in this monastery, which was inhabited by a few secular priests only. In the year 1027, king Canute granted both the monastery and lands with which it was endowed to the monks of St. Austin's abbey in Canterbury, who translated the body of St. Mildred to their own church.

About a mile to the east of the above structure, St. Eadburga, the second abbess of Minstre, built, about the year 740, a monastery dedicated to St. Peter and St. Paul; but it shared the same fate with that erected by St. Domneva, being totally destroyed by the Danes.

On the sea-shore, just before you enter the Isle of Thanet, is Reculver, once the Regulbium of the Romans. It is said that Severus, emperor of Rome, about the year 205, built a castle here, which he fortified against the Britons; and that Ethelbert, one of the kings of Kent, erected a palace here, the compass of which is still visible from the ruins of an old wall. Several Roman vessels, cisterns, and cellars; besides vast numbers of coins, rings, bracelets; and other curious antiquities, have been frequently discovered here; which serves to shew that this was anciently a very considerable place, though the sea has now washed away the greatest part of the ground on which the town formerly stood.

In the year 669, Egbert, king of Kent, gave to one Basse, once a nobleman of his court, but then a priest, some lands at Reculver, where he built a monastery, and dedicated it to the Virgin Mary. In the year 944, it was annexed to Christ-church in Canterbury, by a grant of king Eadred, when, probably, the abbot and black monks were removed. But however that be, it seems to have been a church of more than common note, under the government of a dean, about the year 1030.

Still keeping near the sea, or, more properly, on the southern side of the mouth of the Thames, we came to Feverham, situated on a creek from the East Swale, forty-eight miles from London. It is a large and populous town, a member of the cinque-port of Dover, and a corporation, governed by a mayor, jurats, and commonality. It is a flourishing place, being situated in the pleasantest part of the county, with the convenience of a creek from a branch of the Medway, called the East Swale, navigable for small vessels. The town consists chiefly of one long broad street, in which is a very good market-house, and a charity-school for ten boys and ten girls, who are taught and cloathed at the expence of the inhabitants. The London markets are from hence supplied with abundance of apples, cherries, and large oysters, of which the Dutch take so large a quantity, that a prodigious number of men and boats are employed here during the winter to dredge for them; and it is said, that the value of the oysters taken annually from Feverham by the Dutch, amounts to between two and three thousand pounds at the first purchase: and the fishermen have here a very good custom; they will admit none but married men to take up their freedom.

This place was formerly notorious for running goods of different kinds from France, and clandestinely exporting wool; and we could wish there were no reasons for believing that practice is not yet totally discontinued.

Feverham is so ancient a town, that in the year 802, it was a royal demesne, and called, in king Kenulph's charter, "The King's Little Town." King Athelstan, in the year 903, summoned a great council here, in which he enacted several laws. Here was also a stately abbey, erected by king Stephen, who, together with Maud his queen, and Eustace their son, were buried in it. The abbey was inhabited by Benedictine monks, and dedicated to Christ. At the dissolution, its annual revenues amounted to two hundred and eighty-six pounds, twelve shillings and six-pence. Two gate-houses belonging to this edifice, but meanly constructed, still remain.

This town has two weekly markets on Wednesday and Saturday, and two annual fairs, viz. the twenty-fifth of February, and the twelfth of August; for linen, woollen-drapery, and toys.

At Ospring, near Feverham, king Henry III. founded, about the year 1235, an hospital, dedicated to the Virgin Mary. It consisted of a master and three regular brethren, of the order of the Holy Cross, and two secular clerks; but falling to decay about the end of the reign of Edward IV. it was, at the request of bishop Fisher, given by Henry VIII. in the seventh year of his reign, to St. John's college in Cambridge.

At Throwley, about four miles south of Feverham, there was an alien priory of Cluniac monks, a cell to the abbey of St. Bertin, at St. Omer's in Artois. In the twenty-second year of the reign of Henry VI. this cell was given in exchange to the abbey of Sion in Middlesex.

At Badlesmere, south of Feverham, Bartholomew, lord of Badlesmere, obtained, in the thirteenth year of the reign of Edward II. a licence for founding a house of regular canons here, but the design was never completed.

Milton, Melton, or Middleton, was the next place we visited. It stands on a creek or branch of the East Swale, navigable for small vessels, forty-four miles from London. The place is said to owe its name to its being situated about the middle of the county, reckoning from Deptford to the Downs. It is governed by a port-reve chosen annually, and who supervises the weights and measures over all the hundred. The parish-church stands a mile distant from the town, which, though a considerable place, is almost concealed by several creeks; as it is approached from the Thames. Here is a large fishery for oysters, vast quantities of which are sent to London: they are called Milton Natives, and esteemed the best in Kent.

The kings of Kent had formerly a palace here, which was castellated, and stood near the spot where the church now stands; but it was burnt to the ground by earl Godwin, in the time of Edward the Confessor.

On Kemley-downs, a little beyond the church, are the ruins of a fortification, overgrown with bushes, and thence called Castle-ruff. It was built by Hastings the pirate, in the time of king Alfred; and there still remain the ditches, and part of the stone-work of another fort, called Bavord-castle, erected by that prince on the opposite side of the water, in the Isle of Shepey, to curb that pirate.

Milton has a weakly market on Saturday, and a yearly fair on the twenty-fourth of July, for toys.

Sittingbourn stands about a mile to the south of Milton. It was once a market-town, and is still a considerable thoroughfare, and furnished with several good inns, among which is one known by the sign of the Red-lion, where John Norwood, a neighbouring gentleman, gave an entertainment to Henry V. and his retinue, on their return from France. The whole expence of this entertainment amounted to no more than nine shillings and nine-pence, wine being then sold at two-pence a pint, and all other things cheap in proportion.

Sittingbourn has no market, but two annual fairs, viz. Whitsun-Monday, for linen and toys; and the tenth of October, for linen, woollen-drapery, and hard-ware.

At Tunstall, in the neighbourhood of Sittingbourn, several hundred broad pieces of gold were found in a coppice, by a poor boy, in January 1738. The boy, ignorant of their value, was playing with them at a farmer's near Canterbury, who got possession of the treasure; but not being able to keep the secret, was obliged to refund six hundred and twenty-four of them to the crown, though Sir John Hales claimed the whole; on a supposition that his ancestor had concealed them there during the civil wars in the reign of Charles I.

From Sittingbourn we took the road to King's-ferry, over which we passed into the Isle of Shepey. A large cable, of about one hundred and forty fathoms in length, is stretched across the strait which separates the isle from the main land; and by this rope the ferry-boat is drawn over from one side to the other. A small stone

building is erected at the ferry on the main land, and is said to owe its origin to one George Fox, who, by waiting there for the boat a considerable time in the cold, he built this place, to shelter others from the inclemency of the weather, who might, like him, wait there for a passage.

For the maintenance of this ferry, and keeping the highway leading to it through the marshes in repair, the land-holders tax themselves at one penny an acre for fresh marsh-land, and one penny for ten acres of salt marsh-land, yearly. This tax, together with some lands belonging to the ferry, has, from time to time, kept both the ferry and causeway in good repair, and also paid the ferryman his salary, he being obliged to carry all passengers over gratis; except on Palm-Monday, Whitfun-Monday, St. James's day, and Michaelmas-day, when a horseman pays two-pence, and a footman one penny; but on Sundays, and after eight o'clock at night, there is no passage gratis; so that the ferryman demands whatever he thinks reasonable on these occasions.

The Isle of Shepey is supposed to owe its name to its being one of the first places in England where sheep were kept, or from its affording plenty of those useful animals. This island is encompassed with the waters of the Thames, and those of the Medway. It is about twenty-one miles in compass, has great plenty of corn, but wants wood.

In the marshy parts of this island are several tumuli, which the inhabitants call Coterels: they are supposed to have been thrown up in memory of some of the Danish leaders who were buried here; for the Danes often made this island the scene of their ravages, and the place of their residence.

The upper grounds of this island produce plenty of excellent corn; but water is every where scarce, most of the springs being brackish.

On the south-west part of the island, where the East Swale divides from the west, stands Queenborough, or Quinborough, so called from its having been built by king Edward III. in honour of his queen. It stands on the banks of the river, forty miles from London; and, though a mean, dirty place, is a corporation governed by a mayor, aldermen, and other officers.

Here was formerly a castle, erected by Edward III. as a defence to the mouth of the river Medway; and was afterwards repaired, in the year 1536, by Henry VIII. who, at the same time, built the castles of Walmer, Deal, and Sandown, for the defence of the sea-coasts. The governors of Queenborough-castle were formerly honoured with the title of Constable; and from the list of them it appears that many were men of great consideration.

This castle was standing in the year 1629; for Mr. Johnston tells us, he then saw there a large dining-room, or hall, round the top of which were placed the arms of the nobility and gentry of Kent; and in the centre those of queen Elizabeth; and under them the following verses, in capital letters:

Lilia virgineum pectus regale leonis

Significant; vivas virgo, regasque leo:

Umbra placit vultus, vultus quia mentis imago;

Mentis imago placet, mens quia plena Deo:

Virgo Deum vita, regina imitata regendo,

Viva mihi vivi fiat imago Dei.

Qui Leo de Juda est, et Flos de Jesse, leones

Protegat et flores, Elizabetha tuos.

A. D. 1593.

Lilies the virgin's breast explain:

Then live a virgin, and a lion reign.

Pictures are pleasing, for the mind they shew;

And in the mind the Deity we view.

May she, who God, and life, and empire shows,

To me the eternal Deity disclose!

May Jesse's Flow'r, and Judah's Lion, deign

Thy flow'rs and lions to protect, O Queen!

At present, there are no remains of this castle to be seen: the ground, indeed, where it stood, is moated

round; and there is a well, about forty fathoms deep, still remaining.

Queenborough sends two members to parliament, and has a yearly fair on the fifth of August, for toys; but the weekly markets, of which there were formerly two, have been long disused.

On the north point of the island is Sheerness, where king Charles II. after the demolition of Queenborough-castle, and the mischief done by the Dutch in the Medway, in the year 1667, erected a strong, commodious, and spacious castle. It is a regular fortification, and has a line of very heavy cannon facing the mouth of the Medway. A good town is also erected near the castle, consisting of several streets; but the situation being low and unhealthy, it is inhabited only by such as are, by the nature of their business, obliged to reside there. The officers of the ordnance have here an office, they being often obliged to be at this place many days together, especially in time of war, when the rendezvous of the fleet is at the Nore, to take care that every ship be furnished with military stores, and to check the officers of the ships in their demands of these stores.

Here is also a yard for building ships, with a dock, chiefly intended for repairing such ships as may meet with any sudden accidents. Small ships only, such as fifth and sixth rate ships of war, small frigates, yachts, &c. are built here; though, on occasion, they can build larger, and even some of sixty-four guns have been actually constructed in this yard.

Sexburgh, widow to Ercambert, king of Kent, and mother of king Egbert, obtained land of her son in the Isle of Shepey, upon which she built a monastery at Minstre, near Sheerness, about the year 675, and endowed it for seventy nuns. The religious suffered greatly from the invasions of the Danes, and those Pagans at last totally destroyed their house; but it was rebuilt, and replenished with Benedictine nuns, by William archbishop of Canterbury, in the year 1130, and dedicated to St. Mary and St. Sexburgh. Here was a prioress and ten nuns about the time of the dissolution, when their annual revenues amounted to one hundred and twenty-two pounds, thirteen shillings and six-pence.

From Sheerness we passed up the river Medway to Chatham, which is properly a suburb to Rochester, and with regard to the town itself, has nothing remarkable; but its docks, &c. well deserve the attention of every traveller. The private buildings, as the houses of the sea-officers, directors, inspectors, and workmen belonging to the royal navy, are well built, and many of them stately; but the public edifices, like the ships themselves, surprisngly large and elegant. The warehouses, or rather streets of warehouses, and other structures for laying up the naval stores, exceed, both in dimensions and number, those any where else to be seen in the world. The rope-walks, for making cables and other cordage, and the forges for anchors, &c. bear a proper proportion to the rest, as well as the canals, ditches, &c. for preserving masts and yards of the largest size, where they lie sunk in water, by which means they are defended from the injuries of the weather.

In the proper store-houses are deposited the sails, rigging, ammunition, cannon, small-arms, swords, cutlasses, and all the other necessaries belonging to the ships that ride at their moorings in the river Medway, powder only excepted, which is generally placed in particular magazines, to prevent accidents. All the above, as well as various other necessary stores, are repositied in separate buildings and storehouses appropriated to each ship, and may be taken on any emergency, without the least confusion.

Besides these, there are other warehouses for laying up the rigging, furniture and stores for ships in general, and for the furnishing other ships as they are built, and repairing and supplying others as occasion may require.

For this purpose there are separate and respective magazines of pitch, tar, hemp, flax, tow, resin, oil, tallow, &c. also of sackcloth, canvass, cables, standing and running rigging, ready fitted; with all kind of ship-chandlery necessaries, such as blocks, tackles, runners, &c. with the cooks, boatswains, and gunners stores;

stores; anchors of all sizes, grapples, chains, bolts, spikes, wrought and unwrought iron, cast-iron work, such as pots, caldrons, furnaces, &c. likewise boats, spare-masts and yards, with prodigious quantities of lead and nails, and other necessaries, too many to be enumerated here.

When the contents of these amazing magazines of stores are deliberately considered, we would almost wonder what ships they were, and where they could be found, which could either for building and repairing, fitting out, or refitting, require such a quantity; but when, on the other hand, we survey the ships and consider their dimensions, the wonder changes its object, and we are amazed how it is possible they can be supplied.

The particular government of these yards is very remarkable. The commissioner, clerks, accountants, &c. within doors; the store-keepers, yard-keepers, dock-keepers, and other officers without doors, are all subordinate to one another respectively, as their degrees and offices require. The watchmen are set duly every night at stated and certain places, within the several yards, each having a bell hung on a post over his head, which they ring or toll every hour, the number of strokes being always equal to that of the clock; and one taking it from the other through out every part of the yard, renders the whole very regular. In the river is a guard-boat, which, like the main guard in a garrison, rows the grand rounds, at certain times, passing by every ship in the river, to see that the watch on board be properly kept; and if each ship does not challenge the guard-boat, they board her immediately to examine into the cause.

The building yards or slips, docks, timber-yard, deal-yard, mast-yard, gun-yard, rope-walks, and all the other yards and places, set apart for the works belonging to the royal navy, resemble a well-ordered city; and though you see the whole place, as it were, in the utmost hurry, yet you see no confusion; every man knows his own business; the master-builder appoints the working, or converting, as they call it, of every piece of timber, and gives the foremen their moulds, for their squaring and fitting every piece, and fixing it in its proper place, or birth, in the ship that is building; and every hand is busy in pursuing these directions. The like order is observed in every other department of these yards.

At Brompton, near the dock-yards, very convenient barracks for the marines, and other land forces, were some years since erected, and are of the greatest advantage to this place; as the soldiers are kept together, and always to their duty, which cannot be done, where they are quartered in different houses about the town.

A charity was instituted here in the year 1558, called "The chest at Chatham." when the seamen in the service of queen Elizabeth agreed to allow a portion of each man's pay, who had been wounded in defeating the Spanish Armada; and the charity has continued ever since. An hospital was also erected here at the private expence of Sir John Hawkins, and incorporated by the above queen, for the relief of ten or more aged and maimed shipwrights and mariners.

Chatham has a weekly market on Saturday, and two annual fairs, viz. the fifteenth of May, and nineteenth of September, for horses, bullocks, and all sorts of commodities.

Gunluph, bishop of Rochester, founded here, in the reign of William Rufus, an hospital for leprous persons, which was dedicated to St. Bartholomew, and afterwards confirmed by Henry III. and other kings, and its revenues augmented by several benefactions. The governor was stiled Custos, and warden, and sometimes prior, and the brethren canons.

The city of Rochester, to which Chatham is joined as a suburb, lies in a valley on the east-side of the Medway twenty-nine miles from London. It was one of the Roman stations and called Durobrus.

It is a very antient city, and the see of a bishop, and has sent members to parliament every since the first summons for such an assembly. It was made a bishop's see by king Ethelbert, in the year 604, and has met with many misfortunes since that period. In 676 it was sacked by Eldred king of Mercia; in 839 and 885, it was besieged

by the Danes, but relieved by king Alfred. About one hundred years after, it was besieged by king Etheldred, and forced to pay one hundred pounds. The Danes took it in 999, and in 1088, it was besieged and taken by William Rufus. In the reign of king John it was taken from the barons, after three months siege; and the very next year its castle, was stormed and taken by several of the barons, under Lewis dauphin of France. In the reign of Henry III. it was besieged by Simon Montford, who burnt its then wooden bridge and tower, and destroyed the church and priory.

Rochester has also been several times destroyed by fire, viz. on the third of June 1130. It was hardly rebuilt before it suffered the same misfortune, being again consumed in 1137. A third conflagration happened in 1177, after which it is said to have continued desolate till 1225, when the buildings were repaired, and the city surrounded with walls and ditches. During the Saxon Heptarchy, here were three mints, two belonging to the king, and one to the bishop.

Rochester is governed by a mayor, and twelve aldermen, of whom the mayor is one, twelve common-council men, a town-clerk, three serjeants at mace, and a water bailiff.

It is a small city, consisting chiefly of one broad, but ill-built street, and having only one parish church and the cathedral: the town is nearly surrounded with a wall which never was very strong; and on the south-east and west sides of this wall there are large suburbs. Some part of an old castle, said to have been built by William the Conqueror, is still standing, and kept in repair: it is used as a magazine, and a party of soldiers constantly do duty in it. Many lands in this county are still held by the tenure of Castle-guard, i. e. upon condition that the tenant should in his turn mount guard here; but a composition is taken for this service, to the payment of which the tenants are strictly kept; for upon a day appointed a flag is hung out from that part of the castle which is still kept in repair; and all tenants who do not then appear, and pay their quit-rents, are liable to have their rents doubled at every tide of the Medway: such is the custom of the manor. Under the castle wall next the river, there is a chalky cliff, part of which having been washed away by the rapidity of the stream, the wall which it supported is fallen into ruins, and forms a romantic appearance; the ground on that side is very low and marshy; and being overflowed by every high tide, the situation is both unpleasant and unhealthy.

Here is a town-house and a charity-school, which are the best buildings in the place, except the churches. A mathematical school was founded here, in the reign of queen Anne, by Sir Joseph Williamson, who then was one of the plenipotentiaries at the treaty of Ryfwick. One Richard Watts also founded an alms-house, and endowed it with sixty pounds a year, for the relief of poor travellers; but excepted persons contagiously diseased, rogues and proctors. Proctors he excepted, because one of that faculty, whom he had employed, when he was sick, to make his will, fraudently made a devise of the whole estate to himself; in which Watts, happening to recover, detected him. This foundation is now so improved, as not only to answer the first intention, but to set other poor at work; and in the summer here are always six or eight lodgers, who are admitted by tickets from the mayor.

Here is a bridge over the Medway, built in the reign of Henry the fourth, by Sir John Cobham, and Sir Robert Knowles, with money which they had raised from spoils taken in France. It consists of twenty-one arches, and is one of the best and strongest bridges in England, next to those of London, Westminster, and Newcastle upon Tyne. For keeping this bridge in constant repair, certain lands were annexed to it by act of parliament, in the reign of king Richard the Third, and by two other acts, in the reign of queen Elizabeth. It was repaired in 1744, and adorned with iron palisadoes.

In several of the creeks and branches of the river Medway, within the jurisdiction of this city, there is an oyster fishery, which is the privilege of every person who has served seven years apprenticeship to any fisherman or dredger,

dredger that is free of it. The mayor and citizens of Rochester hold what is called an admiralty court once a year, or oftener, upon occasion, to appoint the times when oysters shall be taken, and settle the quantity each dredgerman shall take in a day. Persons who dredge for oysters, not being free of the fishery, are called Cablehangers, and are prosecuted, and punished by the court. Every licensed dredger pays six shillings and eight-pence yearly to the support of the courts, and the fishery is now in a flourishing state.

The cathedral was originally erected about the year 600, by Ethelbert king of Kent, who dedicated it to St. Andrew. In the time of William the Conqueror, it was repaired on its original plan, by Gunluph, bishop of this diocese, who is said to have been an architect, and to have directed the building of the castle by the king's order. On the north side of the north-west tower of the cathedral is a statue of the above bishop; and here are walls four yards thick, the remains of a great tower, called Gunluph's Tower. The cathedral, which is but small, has nothing remarkable.

The ancient military way, called Watling-street, crossing Kent from Shooter's-hill to Dover, runs directly through this city.

Etheldred placed in this cathedral a bishop, and a chapter of secular priests, who being reduced to four or five, and obliged to resign, bishop Gunluph, in the year 1089, settled fifty or sixty black monks in the cathedral. Upon the dissolution, the bishoprick was valued at four hundred and forty-four pounds, four shillings and two-pence *per annum*; and the priory at four hundred and eighty-six pounds, eleven shillings and five-pence. But the priory being dissolved at the general suppression of religious houses, Henry VIII. added a chapter, consisting of a dean, and six secular canons or prebendaries, a deacon, a sub-deacon, six lay-clerks, and eight choristers.

Rochester sends two citizens to parliament, has a weekly market on Friday, and two annual fairs, viz. the thirtieth of May, and the eleventh of December, for horses, bullocks, and various sorts of commodities.

On the west side of the river Medway, and joined to Rochester by the bridge, is Stroud, a very large village, and may be considered as a suburb to Rochester. In the year 1194, Gilbert Glanville, bishop of Rochester, built an hospital here, called the New Work. It was dedicated to the Virgin Mary, and appropriated to the reception of poor travellers, and the relief of other indigent persons. It consisted of a master, a warden, and several priests; and endowed with fifty-two pounds, nine shillings and ten-pence *per annum* at the suppression, when it was given to the dean and chapter of Rochester.

Stroud has no weekly market, but an annual fair is held here on the twenty-sixth of August, for toys.

In the year 1362, the church of St. Mary Magdalen at Cobham, a village about five miles to the west of Stroud, was made collegiate by lord Cobham, who established there five chaplains, one of whom was the master. But it afterwards consisted of eleven priests, who, at the general dissolution of religious houses, were endowed with yearly revenues amounting to one hundred and forty-four pounds, one shilling and a penny.

Leaving Rochester, we took the road to Maidstone, and in our way visited that remarkable piece of antiquity, called by the common people Kett's, or Keith-coty-house. It is situated on the side of a chalky hill near Aylesford, about four miles north of Maidstone; and consists of a large heap of huge stones, some standing end-wise, and others lying across, and supposed to be the tombs of Kentigern and Horbus, two Danish princes who were slain here in a battle with the Britons, or, as some say, with Vortinas and Hengist the Saxon.

About three miles to the eastward of these sepulchres is the village of Buxley, where William de Ipre, earl of Kent, founded, in the year 1146, an abbey of Cistercian monks, from Claraville in Burgundy. The structure was dedicated to the Virgin Mary, and endowed, at the suppression, with two hundred and four pounds, four shillings and eleven-pence *per annum*.

Maidstone is a large town, situated on the banks of

the river Medway, thirty-six miles from London. The river is navigable hither for barges, and hoys of fifty or sixty tons burden, the tide flowing quite up to the town. It is incorporated, and governed by a mayor and commonality; is a pleasant and populous town: one of the county gaols is kept in it, and it has the custody of weights and measures, renewed by the standard of Henry VII. as being nearly in the middle of the county; and for the same reason the courts of justice are always held here, and generally the county assizes, and elections for knights of the shire. This town has, however, but one parish, of which the archbishop of Canterbury is rector, it being one of his peculiars, and served by his curate. There are indeed two churches, and some Dutch inhabitants have divine service performed for them in one of these edifices. Here are four charity-schools, one for thirty boys, another for thirty girls, both of them clothed; a third for thirty boys, who are distinguished by cloaks and bands; and a fourth for twenty boys and girls; besides which, there is also a free-school. The stone bridge over the Medway, which is at once a firm and commodious structure, was erected by one of the archbishops of Canterbury.

The chief trade of Maidstone is in thread, which is made here in great perfection; and in hops, of which there are large plantations; and also extensive orchards of fine cherries. From this town, and the adjacent country, London is supplied with more commodities than from any other market-town in England; particularly with large bullocks, timber, wheat, hops, apples and cherries, and a sort of paving-stone about eight or ten inches square, exceeding durable, and a fine white sand for glass-houses and stationers.

An hospital, called the New Worke, was erected in this town about the year 1260, by Boniface, archbishop of Canterbury, and dedicated to St. Peter and St. Paul. But this hospital, together with some other churches appropriated to it, was, in the nineteenth year of Richard II. united to the college of All-Saints, founded in the parish-church here about that time, by William Courtney, archbishop. It consisted of a master and several priests, whose annual revenues, at the suppression, amounted to two hundred and twelve pounds, five shillings and three-pence.

Here was also a convent of grey-friars, founded by king Edward III.

Maidstone sends two members to parliament, has a weekly market on Thursday, toll-free, for hops; and four annual fairs, viz. the thirteenth of February, the twelfth of May, the twentieth of June, and the seventeenth of October, for horses, bullocks, and various sorts of commodities.

At Leeds, near Maidstone, Sir Robert de Crepito Corde, built, in the year 1119, a priory of black canons, dedicated to St. Mary and St. Nicholas. At the suppression, this priory was endowed with yearly revenues amounting to three hundred and sixty-two pounds, seven shillings and seven pence.

Leaving Maidstone we continued our tour along the banks of the river Medway to Tunbridge, or the town of Bridges, so called from the great number of bridges here over the Medway and its different branches. It is situated in a pleasant part of the county, twenty-nine miles from London. Most of the houses are ill-built, and the streets worse paved. The church is modern, and there is a free-school erected by Sir Andrew Judd, lord mayor of London, a native of this place, who appointed the skimmers company trustees of the charity, on which an estate was settled by act of parliament, in the reign of queen Elizabeth.

About four or five miles south of the town are Tunbridge wells, situated at the bottom of three hills, called Mount Sinai, Mount Ephraim, and Mount Pleasant, on each of which are good houses. The place has greatly increased of late years, and is now become very populous.

Queen Anne, before her accession to the throne, was there several seasons; and most of the present royal family have also honoured it with their presence; and great numbers of nobility and gentry from London, and all parts of the kingdom, resort thither from May to the beginning of October.

About

About ninety years ago, a very handsome chapel was built by the voluntary contributions of the company that frequented the Wells, in which divine service is performed every day in the time of the season; and at other times on Sundays. There is also a charity school, where seventy poor boys and girls are wholly maintained and taught, by the voluntary contribution of the company resorting to the Wells, and the gentry residing there.

The Wells, commonly called Tunbridge, are in the parish of Speldhurst. At the bottom of the walks, near the chapel, there are two of them; one is used only by those who drink the waters.

The walks are handsomely paved: and on one side is the assembly-room, the coffee-rooms, the booksellers libraries, shops for jewellers, milliners, toys, china, and Tunbridge-ware. This last article employs a great number of people at this place: It is made principally of holly, which grows in plenty thereabout; though some of it they make of plum-tree, cherry-tree, and sycamore; of which they make great variety of tea-chests, dressing-boxes, punch-ladles, and many other little things, in greater perfection than any where else in England. On the other side the walks is another assembly-room, and coffee-rooms, the taverns, and a few houses for lodgings: The music-gallery is in the midst of the walks; and the walks are beautifully shaded with trees. A piazza extends from the upper end to the bottom, quite down to the wells. They have an exceeding good market every day for meat, fish, poultry, &c. all which are sold in general very reasonable, and are excellent in their kind. The houses and lodgings are neatly furnished, and very commodious; most of them on the hills contiguous, called Mount Sion, Mount Ephraim, and Mount Pleasant, near the Wells.

The soil is very dry, and the situation so very healthful, that it contributes greatly (together with the early hours always used there, and constant exercise on horseback, or walking) to restore health to those that drink the waters.

The rocks, commonly called the high rocks, are about a mile from the walks. There are a vast number of them; most of which are adjoining to each other, for the space of a quarter of a mile, or more; several of them are seventy or eighty feet high; and at many places there are cliffs and cavities that lead through them, by narrow, dark passages; and their being situated among woods, by a little winding brook, which divides Kent from Sussex, makes them afford a most retired, gloomy, and romantic scene.

Tunbridge waters (says an eminent physician) are nothing but an impregnation of rain, or compressed cloud-waters, in some of the eminences of the neighbouring country. And indeed all hills and conspicuous elevations are mere hollow nests of some minerals. Iron and sulphur are the most common and universal minerals; and almost all kinds of stone fit for making fences or edifices have in their composition one or both of them. All the varieties of hard, black, dark, or greyish stones, abound with ferruginous particles; and iron is so necessary, especially in countries between the tropics and the poles, for husbandry, that there is scarce a mile square within the compass, where it may not be found with its impregnated waters. This is demonstrable by the action of the loadstone on most minerals, the magnet itself seeming to be scarce any thing but a purer clod of iron: and pure polished iron, we know, with very simple management, becomes highly magnetic. Hence we account for the frequency of chalybeate mineral waters, of some degree of strength or other, so readily to be found between the poles and tropics. And this is a bountiful provision of nature to those colder climates, where animal food, and fermented liquors, are so necessary for the support, comfort, and greater proportion of animal force required in them, for their defence from the swarming of ravenous animals, and for hunting animal food, where the vegetable is neither so proper, nutritive, nor abounding, as in these kindlier climates between the tropics towards each side of the equator. Mineral chalybeate waters brace the solids, which animal food, and fer-

mented liquors, in any plenty; are apt to relax; and wind up the springs of animal motion; to keep the blood fluid; which the just-mentioned indulgences are disposed to thicken. Soft stone, marle, alkalious clay, and all kinds of bituminous earths; have a large quantity of sulphur in them; for sulphur, oil, and bitumen, always leave earth brittle, spongy, and alkalious (alkalies being only a harder earthy sponge); and when the watery impregnations meet, they naturally produce by fermentation some degree of heat in the mixture. There is in nature (as this learned gentleman thought) but one kind of salt, which is nitre; and the variety arises from a mixture of sulphur, earth, or iron, in different proportions combined in their composition. Nitre, however, and sea-salt, have their principal efficacy from the predominant principle in their texture: and thus Tunbridge waters are only a finer solution of green vitriol, or natural salts of steel, or rain-waters, inimitable by art in such salutary effects as nature always produces. For example; though art may imitate, in precious stones, all the varieties of colours, reflexions, refractions, and emissions of light; yet there is always some one peculiar property, as of hardness, weight, or water, which discovers the sophistication. In like manner, all the wines on the globe may be so imitated, that neither eye, nor palate, nor the perception of their effects on animal bodies, can discover the fiction; and this without one drop of the juice of the grape, from the saccharine quality only of almost all fruits, seeds, or herbs: yet, by analysing them in some proper menstruum, the cheat may be found out. Thus we may imitate all the several mineral waters on the earth, and pretty nearly conciliate all their general or grosser salutary virtues on diseased animals: yet there is an unaccountable something in the taste, lightness on the stomach, cheerfulness and alacrity they give, which all our skill can never bestow. The principle of individuation, the size of their last and least particles, the proportion of the several parts of the composition to the watery menstruum, and the due time of their impregnation, are, and ever will be, unknown to us; as will consequently the degree required to wind up, strengthen, and contract the relaxed solids of diseased human bodies, to such an height, that they may be enabled to grind, dissolve, and thin the concreted juices, as these active, strong, and invigorating waters of Tunbridge usually do: for in all robust constitutions but partially depraved, in the cold chronic distempers of such habits, in nervous disorders and low spirits, in weak digestions and gross habits, they are extremely successful, especially in the hotter seasons of the year.

The air at the wells is excellent, all provisions very reasonable, and the best wild-fowl, particularly wheat-eats, are here in great plenty during the season. These birds are caught in Sussex, not far from the wells, where the diversions and amusements common to these places of resort, as balls, assemblies, &c. are conducted in a very polite and agreeable manner.

At the town of Tunbridge, and on the south side of the Medway, are the ruins of an old castle, built by Richard earl of Clare, natural son to Richard I. duke of Normandy, who exchanged lands in that duchy for an equal quantity here. This castle appears, from the remains of it, to have been very large.

About the end of the reign of Henry I. Richard of Clare, earl of Hertford, founded here a priory of black canons. It was dedicated to St. Mary Magdalen, and its revenues were valued at one hundred and sixty-nine pounds, ten shillings and three-pence *per annum*. It was one of those small monasteries which cardinal Wolsey procured to be dissolved, and obtained a grant of it for endowing his college at Oxford, in the seventeenth year of the reign of Henry VIII.

Tunbridge has a market on Friday, and three annual fairs, viz. Ash-Wednesday, the fifth of July, and the twenty-ninth of October, for bullocks, horses, and toys.

While we continued at Tunbridge-wells, we made several excursions into the neighbouring country, to

view the fine seats, &c. of which there are several, particularly

Penshurst, about five miles from Tunbridge-wells, has the river Medway running by it, the ancient manor and seat of the illustrious family of the Sidneys, from whom Sir Philip descended, who was killed in a warm engagement with the enemy at Zutphen in Guelderland; of whom bishop Gibson says, he was the glory of his family, and the darling of the learned world; the most lively pattern of virtue, and the brave and worthy patron of his country. This seat and personage is celebrated by Waller.

Had Schariffa liv'd, when mortals made
Choice of their deities, this sacred shade
Had held an altar to her pow'r, that gave
The peace and glory which these alleys have,
Embroider'd so with flowers where she stood,
That it became a garden of a wood:
Her presence has such more than human grace,
That it can civilize the rudest place:
If she sit down, with tops all tow'rd's her bow'd,
They round about her into arbours crowd;
Or if she walk, in even ranks they stand,
Like some well-marshal'd, and obsequious band.

- - - - - The sacred mark
Of noble Sidney's birth; where such benign,
Such more than mortal-making stars did shine;
That there they cannot but for ever prove,
The monument, and pledge of humble love.

Somerhill, contiguous to Tunbridge, is a noble seat, formerly the residence of the earl of Clare, in a pleasant rural situation.

Bayhall, about two miles from the wells, in Phippen parish, the seat of Charles Amhurst, Esq; is very neat, though not large.

Shipbourne, about two miles from Tunbridge, is thus described by the poet,

Next Shipbourne, tho' her precincts are confin'd
To narrow limits, yet can shew a train
Of village beauties, pastorally sweet.

Smart's Hop-Garden.

Here is also the seat of lord Vane.

Mereworth, a small distance from Farilawn, the residence of lord Westmoreland. It was anciently large and spacious, like a castle, belonging to the Nevells, lords of Abergavenny; but the house is lately rebuilt in a very grand and magnificent manner, designed by Collin Campbell, in imitation of a stately edifice in Italy, built by the famous Palladio: it stands on a small eminence, in a peninsula, moated round: behind it is an eminence that commands a glorious prospect of the house, spacious and regular gardens, and of the country adjacent.

Nor shalt thou, Mereworth, remain un Sung,
Where noble Westmoreland, his country's friend,
Bids British greatness love the silent shade,
Where piles superb, in classic elegance
Arise; and all is Roman, like his heart.

Smart's Hop-Garden.

Goudhurst, the next place we visited, is situated on the road from Tunbridge to Cranbrook, forty-eight miles from London. It has nothing remarkable but its church, which was so impaired by a storm of thunder and lightning on the twenty-third of August 1637, that it became necessary to take down the steeple, which was lofty, and built of stone. A brief was granted to rebuild it; but the small wooden steeple which was erected in haste on the top of the stone-work, still continues. Here is a weekly market on Wednesday, and an annual fair on the twenty-sixth of April, for cattle.

At Cumbwell, near Goudhurst, Robert de Turneham founded, in the reign of Henry II. a priory of the order of St. Augustine. It was dedicated to St. Mary Magdalen, and consisted of a prior and six canons. At the dissolution, the annual revenues amounted to eighty pounds, seventeen shillings and five-pence.

About three miles from Goudhurst is Cranbrook, situated in the woody part of the county, sixty miles from London. This place is famous for being the spot where the first woollen manufactory in this kingdom was erected by some Flemings, who were encouraged to settle here, in order to teach the manufacture to the English. This trade has, however, long since deserted Cranbrook, which is now a place of very little account.

Here is a weekly market on Saturday, and two annual fairs, viz. the thirtieth of May, and the twenty-ninth of September, for horses and black cattle.

About four miles south-east of Cranbrook, is a village called Newenden, situated upon the river Rother. This, in the opinion of Camden, is the haven called, in the Notitia of Antoninus, Anderida, by the ancient Britons Caer Andred, and by the Saxons Andredseafstre. The Romans, to defend this coast against the ravages of the Saxon pirates, placed here a band of the Abluci, under the count, or lord warden of the Saxon shore, at which time it was a famous city, and continued to be the chief place of strength in this part of the county, till about the year 488, when the first king of the South Saxons besieged and took it by storm from the Britons, put them all to the sword, and razed the place to the ground. It was, however, rebuilt in the reign of Edward I. and was then, in respect to the old town, and its situation in a den or dale, called Newenden, or a new town in a valley. It has no market, but an annual fair is held here on the first of July, for linen and toys.

About fourteen miles north-east of Cranbrook, is Ashford, or Eshford, situated on a small river called the Esh, from which there was here formerly a ford, fifty-seven miles from London. It is governed by a mayor, and has a court of record every three weeks, for all actions of debt or damages not exceeding twenty merks. The church is large, and was formerly collegiate; and here is a free grammar-school.

Here is a weekly market on Saturday, besides which there is another held every Tuesday fortnight; and two annual fairs, viz. the seventeenth of May, and the ninth of September, for horses, black cattle, and pedlars ware.

About four miles to the north-east of Ashford, is Wye. It stands on the banks of the Stour, which is navigable hither for barges, fifty-seven miles from London. Here is a good stone-bridge over the Stour, and was formerly a royal manor, given to Battel-abbey by William the Conqueror; and Edward II. after the burial of his father, and before his coronation, kept his Christmas in the manor-house. The church, which was formerly collegiate, has been rebuilt since the year 1706, when the old one was almost reduced to ruins by the fall of the tower.

In the year 1431, John Kemp, then archbishop of York, afterwards a cardinal and archbishop of Canterbury, began a college for a master or provost, and several secular canons. The structure was finished in 1447, dedicated to St. Gregory and St. Martin; and its revenues, at the suppression, amounted to ninety pounds two shillings *per annum*.

Wye has a weekly market on Thursday, and two annual fairs, viz. the twenty-fourth of March, and the second of November, for horses, black cattle, and pedlars ware.

Four miles to the north of Wye, and near the river Stour, is a village called Chilham, supposed to be the place where Julius Cæsar pitched his camp at his second expedition into Britain; and to have been at first called Jul-ham, or Julius's Station, of which the present name is thought to be a corruption. Near this place there is a green barrow, called Jul Laber, which is thought to be the grave of Luberius Dorus, the tribune, who was killed by the Britons in the march of the Romans from that camp.

Lenham is a small market-town, situated on the road leading from Canterbury to Maidstone. It stands upon the river Len, forty-seven miles from London, but has nothing worth remarking, except a small weekly market on Tuesday, and two annual fairs, viz. the sixth of June, and the twenty-third of October, for horses, black cattle, and toys.

The parish church of Ulcomb, two miles and a half south-west of London, was made colligate for an arch-priest and two canons, with one deacon, and one clerk, by Stephen Langton, archbishop of Canterbury, about the year 1220, at the request of Ralph de S. Leodegario, its patron. It was in being in the year 1293, but seems to have dropped afterwards, and the church became, as it is now, a single undivided rectory.

At Muttenden, south of Lengham, was a priory of trinitarian friars, founded by Sir Robert de Rokefly, about the year 1224, and dedicated to the Trinity. Upon the suppression it was endowed with annual revenues amounting to sixty pounds thirteen shillings.

We now passed through Maidston, to West Malling, a small inconsiderable town, twenty-nine miles from London. Gunluph, bishop of Rochester, founded here in the time of William the Conqueror, an abbey for nuns of the order of St. Benedict. It was dedicated to the Virgin Mary, and its annual revenues, at the suppression, amounted to two hundred and eighteen pounds four shillings and two-pence. Here is still a free-school, a weekly market on Friday, and three annual fairs, viz. August the twelfth, October the second, and November the seventeenth, for horses, black cattle, and toys.

At West Peckham, or Little Peckham, three miles from West Malling, there was a preceptory belonging to the knights of St. John of Jerusalem, valued, upon the dissolution, at sixty-three pounds six shillings and eight-pence per annum. This house is said to have been founded for the use of the Templars; but on this dissolution in the first of Edward II. it came with the rest of their lands to the hospital.

Wratham, or Wortham, the next place we visited, is a small town twenty-five miles from London. It has nothing remarkable but its church, which is pretty large, and has sixteen stalls, supposed to have been built for the clergy attending the archbishop of Canterbury, who had a palace here, till Simon Islip, who filled that see in the fourteenth century, pulled it down, and erected another at Maidston with the materials. Here is a market on Tuesday, and an annual fair on the fourth of May, for horses, bullocks, and toys.

About seven miles from Wrotham, and twenty-three from London, is Sevenoke, said to have had its name from seven exceeding large and tall oaks that once stood near this place. It is situated in the road to Tunbridge and Rye, and is a corporation, governed by a warden and assistants. Here is an hospital for maintaining poor old people, and a school for educating poor children, built and endowed by Sir William Sevenoke, who was lord mayor of London in 1418; and said to have been a foundling, brought up by some person of this town, whence he took his name. John Potkyn, who lived in the reign of Henry VIII. was a great benefactor to this school, and the revenue being augmented by queen Elizabeth, it was thence called queen Elizabeth's free-school. It was rebuilt in 1727, and the stile of the corporation is the wardens and assistants of the town and parish of Sevenoke, and of queen Elizabeth's free-school there. This town has also a charity school for fifteen boys; besides the above hospital, there is another still more ancient, dedicated to St. John the Baptist, in the gift of the archbishop of Canterbury.

It was in this parish that the rebel, Jack Cade, in the year 1450, defeated and killed Sir Humphry Stafford, his brother William, and several other persons of note, sent against him by Henry VI.

Sevenoke has a weekly market on Saturday, and two annual fairs, viz. July ten, and October twelve, for hogs and toys.

Westram, or Westerham, is a small market-town, near the head of the Darent, twenty-three miles from London. It has nothing remarkable but a large house called the Squerries, built by the late earl of Jersey. Here is a weekly market on Friday, and an annual fair on the nineteenth of September, for bullocks, horses, and toys.

Gravesend, which we next visited, is situated on the Thames, opposite to Tilbury Fort in Essex, and twenty-two miles from London. This town and Milton, a small

village a little to the east of Gravesend, were incorporated in the tenth year of queen Elizabeth's reign, by the stile of the portreve, jurats, and inhabitants of Gravesend and Milton; but the name of portreve is now changed into that of mayor.

In the reign of Richard II. the French and Spaniards coming up the Thames, burnt and plundered the town, and carried away most of the people. To compensate for this misfortune, the abbot of St. Mary le Towerhill, to whom Richard II. had granted a manor belonging to Gravesend, called Parrock's, obtained a grant from the crown, that the inhabitants of this place and Milton should have the sole privilege of carrying passengers by water from hence to London, at four-pence the whole fare, or two-pence a head, which was confirmed by Henry VIII. but now the fare is six-pence a head in the tilt-boat, and one shilling in the wherry. Coaches ply here at the coming in of the tilt-boats, to carry passengers to Rochester.

Henry VIII. built two platforms one at this town and the other at Milton: they are mounted with heavy cannon, and intended as a defence to the mouth of the Thames.

In the year 1624, one Mr. Pinnock gave twenty-one dwelling-houses here, besides one for a master-weaver, for the employment of the poor: and here is a charity-school for twenty boys, who are taught and clothed.

All outward bound ships are obliged to anchor in the road before the town, till they have been visited by the custom-house officers; and for this purpose a sentinel at the block house gives notice when any ship is coming down the river, by firing his musket. But the homeward bound all pass by without notice, unless to receive tide-waiters on board, if they are not supplied before. Most of the outward bound ships complete their cargoes, and take in provisions here, so that the place is full of seamen, who appear always in a hurry.

In the year 1727, the whole town of Gravesend, together with its church was consumed by fire: and the parliament in order to assist the inhabitants in rebuilding their town and church, granted five thousand pounds by an act passed in 1731, and the church is accordingly considered as one of the fifty new ones, then ordered to be built at the expence of the public.

The town is large and populous, but the streets narrow and dirty, and the buildings mean. In the east part of the town, are the remains of an old chapel, supposed to have belonged to some religious house formerly here; but there are no vestiges of any edifice of that kind.

The towns for several miles round Gravesend are supplied from hence with garden stuff, of which great quantities are also sent to London, where the asparagus of Gravesend is preferred to that of any other place.

Gravesend has two weekly markets on Wednesday and Saturday; and two annual fairs, viz. April the twenty-third, and October the twenty-fourth, for horses, black cattle, cloaths, toys, and many other sorts of goods.

In the neighbourhood of Gravesend are a great variety of romantic landscapes. The hills are wild, steep, almost covered with wood, and rise into bold variations, between the breaks of which vast prospects of the valley beneath, and of the Thames winding through it, are every now and then seen; and from the tops of some of them very extensive prospects of the whole country at large.

Leaving Gravesend, we took the road to Dartford, and in our way passed by Swanscomb, a village about two miles from Gravesend, and so called from its having been a camp of Swain king of Denmark. This place is also remarkable for being the spot where the Kentish-men, after surprising William the Conqueror, by covering their approach to his army with green boughs, bravely offered him battle, unless he consented to confirm their ancient privileges, which he very prudently chose to do.

Dartford, or Darentford, so called from its situation on the Darent, which runs through the town, is a handsome and populous place, sixteen miles from London. It stands on the road leading from London to Canterbury and

and Dover, and has several good inns. The river Darent is navigable for barges to this town from the Thames. The church, which is large, and dedicated to the Trinity, has two church-yards, one round the edifice, and the other without the town, on the top of a hill, which is so high, that it overlooks the tower of the church.

About the year 1355, Edward III. founded and endowed a celebrated nunnery in this town, and dedicated it to St. Mary and St. Margaret. The prioress and nuns were first of the order of St. Augustine, then of St. Dominic, and afterwards of St. Augustine again. At the dissolution, they were a second time of the order of St. Dominic, but under the government of black friars settled at Langley in Hertfordshire. It was endowed at the suppression with yearly revenues amounting to three hundred and eighty pounds nine shillings.

Here is a very large weekly market, chiefly for corn, which is frequented from many parts of the county; and an annual fair on the second of August, for horses and bullocks.

Two miles to the west of Dartford is Crayford, so called from its situation on a small river called the Cray, over which there was formerly a ford. It is an obscure town, and has nothing worth remarking, except a small market on Tuesday.

But on the heath, and in the fields near the place, are several caverns, from ten to twenty fathoms deep, narrow at the top, and wide at the bottom. Some think they were dug by the ancient Britons, and used by them as granaries for securing their corn; but others suppose they were made by the Saxons, as receptacles for their wives, children, and effects, when they were at war with the Britons.

A little to the southward of Crayford, is a small place called Foot's Cray, remarkable for the elegant seat of Bouchier Cleve, Esq; and called Foot's Cray-place. It was built by himself after a design of Palladio of the Ionic order, and is very elegant. The gallery which extends the whole length of the north front of the house, is a very grand room, and is filled with pictures by the most eminent masters; there are several other good pieces in the dining room and parlour, of all which the following is an exact list.

Common Parlour.

Seven sea pieces. Vandevelde.
A small Dutch kitchen. Calf.
Landscape. Wynants.
Mocking Christ. Bassano.
View of the Rialto. Marieschi.
View of St. Mark's palace, and a bull-feast at Venice. Caneletti and Chimeroli.
Moon light Vandeneer.
Emblematical picture. Gulio Carpioni.
Landscape under it, by Glauber; figures by Laireffe.
Doge's palace. Carlovarin.
A sea port and market in Holland. Wynix.
Landscape by Glauber—Figures by Laireffe.
A smith's shop. Old Wyke.
Oval landscape. Lambert.

Gallery West End.

Landscape morning. Claude Lorrain.
Ditto evening. Ditto.
Venus and Cupid. Vandyke.
Landscape. Both.

North Front.

Adoration of the shepherds. Old Coloni.
Temple of the Muses. Romanelli
Susanna and the elders. Guercino.
Wolf and dogs, by Sayders; the landscape, by Rubens.
Flower piece. Van Huysum.
Abraham and Hagar. Rembrandt.
Landscape. Paul Potter.
Jacob with his flocks. Rosa Tivoli.
Landscape. Gaspar Poussin.
Fruit piece. De Heem.
French king on horseback. Vandermulen.
Three horses mounted. Van Dyke.

East End.

Judgment of Paris. Guiseppe Chiari.
Landscape. Hobima.
Paradise. Tempesta.
Landscape, by Paul Brill; figures Annibal Caracci.

South Side.

Lapithae and Centaurs. E. Giordano.
Landscape. Wouverman.
Country wake. Teniers.
Landscape. Wouverman.
View of Venice. Canaletti.
Holy family. Rubens.
Madona. Carlo Dolci.
Christ blessing St. Francis. Annibal Caracci.
Dead Christ. Ditto
Smith's forge. Brouwer.
Cat and boys. Old Mieris.
Dead game and figures. Snyders and Rubens.
Heraclitus and Democritus. Rembrandt.
Sea piece. Vandevelde.
Boy and goat. Vanderborch.
A view of the Rhone. Teniers.
Cattle. Adrian Vaudevelde.
Circumcision. Paul Veronéfe.
View in Venice. Canaletti.
Venus and Adonis. Rubens.
A Dutch lover. Jan Stein.
A view near Harlem. Rysdale.
Presentation of Christ. Rembrandt.
Miraculous draught of fishes. Teniers.
Jan Steen playing on a violin. Himself.
Head. Hans Holbein.
Toilette. Metzui.

Drawing Room.

Temple of Delphi. Pietro da Cortona.
A Retreat. Bourgognone.
Woman taken in adultery. Pordenoni.
Dead game. Fyt.
Field of battle. Bourgognone.
Diogenes. Salvator Rosa.
Landscape. Gaspar Pruffin.
Dutchman. Le Duck.
Boors drinking. Ostade.
Landscape. Gaspar Poussin.
Boys at cards. Morello.
Faith, Hope, and Charity. Lorhetto di Verona.
Inside of a church at Antwerp, De Neef, figures, Old Franks.
Portrait. Rembrandt.
Magdalen. Francisco Mola.
Democritus, in the posture Hippocrates found him in near Abdera. Salvator Rosa.
Admittance to see the house is by tickets from Mr. Cleve, every Thursday during the summer.
About four miles to the southward of Foot's Cray is St. Mary's Cray, a small town near the source of the Cray, and twelve miles from London. It is a place of no note, and remarkable only for a charity-school, a weekly market on Wednesday, and a yearly fair on the thirteenth of February.

Bromley, the next place we visited, is a small town situated on the road to Tunbridge, ten miles from London. The church is pretty large, and decorated with a square tower. The bishop of Rochester is rector of this parish, and that prelate has a palace in the neighbourhood, where there is a mineral spring, the waters of which have been found, from a chemical analysis, to contain the same qualities of the Tunbridge water, but in a greater degree. Here is a college, which was erected and endowed by bishop Warner, in the reign of Charles II. for twenty widows of poor clergymen, with an allowance of twenty pounds a year to each, and fifty pounds a year to a chaplain.

Here is a weekly market on Thursday, and two annual fairs, viz. the third of February, and the fifth of August, for horses, bullocks, sheep, and hogs.

Eltham lies about four miles from Bromley, and seven from London. It was formerly a royal palace, where many of our monarchs often resided, particularly Edward II. whose queen was delivered of a son here, thence

thence called John of Eltham. The place was much improved by his successor, and the statutes by which the royal household is still governed, were compiled here. There are now very few, if any vestiges of the palace remaining; but it is a pleasant town, and full of good houses, many of which are inhabited by merchants. Here are two charity-schools for twenty boys and ten girls, all of which are taught and clothed. The market is held on Monday; besides which, there are four annual fairs, viz. Palm-Monday, Easter-Monday, Whit-sun-Monday, and the tenth of October, for horses, cattle, and toys.

Leaving Eltham, we crossed Black-heath, in order to visit Woolwich, and stopped at the fine seat belonging to Sir Gregory Page, Bart. It is a noble building, with two handsome fronts; that to the south is ornamented with an Ionic portico. The hall is a very elegant room, adorned with handsome pillars, and other ornaments in a just taste. Out of it, on the left hand, you enter the dining-room, well proportioned, with a small recess for the side-board. The sitting up, rich carving and gilding, on a white ground; chimney-piece of white marble, polished, and very beautiful. It opens into the gallery, which is sixty feet long, twenty broad, and twenty high, hung with crimson; ceiling, cornice, door-cases, and all the ornaments exceedingly elegant gilt carving, on white grounds. In this room are the following pictures.

Judgment of Solomon, painted in a very pleasing stile; the figures and group fine; but the diffusion of the light very incorrect. The expression of it across the child on the floor is good; but from whence comes it? It is by no means in unison with the rest. By Battoni.

Adam and Eve, and Stratonice, two pieces: the female figures are uncommonly soft, delicate, and elegant; the expression of the naked is very brilliant, and vastly pleasing. Peter Vanderwerff.

A poulterer's shop, and a fishmonger's ditto, its companion. Very minute expression, highly finished: the exact imitation of the basket will make you smile with pleasure. Meiris.

Juno and Ixion. Rubens.

Rubens and his mistress.

David and Abigail.

These pieces, which are fine, are in his general stile, the females capitally plump, but in my opinion they are not of a striking expression. A fruit and fowl-piece by Snyders, the figures of this master: Snyders's share in this piece seems to be much superior to Rubens'. The close and lively imitation of nature in the fruit and fowls is very fine.

Landscape with cattle. The angels appearing to the shepherds. Dark, coarse, and unpleasing; they totally want that brilliancy of colouring, which is often met with in this master's pieces. Bassan.

Next we entered the drawing-room, twenty-five feet by twenty, ornamented in a very rich and elegant taste; the chimney-piece very handsome. It is adorned with twelve pictures, containing the history of Cupid and Psyche, by Juca Giordano, very fine. Out of this you go into the saloon, thirty-five by twenty-five, the chimney-piece of which is exquisitely elegant; the door-cases and all the ornaments beautiful; the slabs very fine, and the pier-glasses large. The principal pictures are,

The Good Samaritan, by Baldeochi, an unpleasing piece.

Return of the Prodigal son: a dark, unpleasing picture; the attitude of the son is disgusting and inexpressive. Calabrere.

The dressing-room is very beautifully ornamented, and contains a most capital collection of pictures; particularly twelve pieces by the Chev. Vanderwerff, which are worthy of a month's incessant admiration. The subjects are as follows:

Shepherds and Shepherdesses Dancing. The attitudes of these figures are inimitable, and sketched with much more grace than might be expected from a painter who finished so exquisitely. The colouring of the naked, the soft and delicate expression of the roundness of the breast and limbs, and the wonderful brilliancy of the

whole piece, which is finished to an astonishing degree of elegance, are all inimitable.

The Roman Charity. Very elegant; the naked of the woman fine.

Venus and Cupid. Beyond all imagination elegantly pleasing; the naked body of Venus is more beautiful than one could have thought the power of colours could have reached. The softness is such, that the flesh seems as if it would yield to the touch; and the harmony of the colouring so bewitching, that a more tempting delicious figure cannot be conceived: the general brilliancy is very capital, nor can any piece be in higher preservation.

Joseph and Potiphar's Wife. Never painter was more happy in the choice of his subjects; for sure the difference between naked women in the age of pleasure, and the martyrdom of saints, form a contrast sufficiently decisive. Potiphar's wife is exquisitely painted.

King Zeleucus giving his kingdom to his son, Extremely fine.

Bathsheba bathing. Exquisitely done.

The Choice of Hercules. The figure of Vice is made in this picture (as it is in the works of the poets) much the most tempting lady; she is inimitably soft and delicate.

Mary Magdalen reading in a grotto. Astonishingly executed; the attitude, colouring, softness of expression beyond all description. We remarked particularly the plaits of the flesh, occasioned by her leaning forwards, under her left breast, amazing! the feet also prodigiously fine.

Message from the Angels to the Shepherds. Very fine. The light comes all from the angel, who is in a position not advantageous for diffusing it agreeably.

Our Saviour and Mary Magdalen. Finished like the rest in a surprising manner. There appears an unnatural twist in her thigh and leg.

Chev. Vanderwerff, his wife and daughter. Very fine.

This is a very slight sketch of the surprising excellencies of these pictures. No one can view this house without regretting the want of a day to view each piece in, I do not remember having seen any thing in the same stile nearly equal to them but lord Orford's David and Abishag, by the same master,

In this room are likewise four exceeding fine pieces of Fruits and Flowers, by Van Huysum; those containing the grapes are beyond all description exquisite, the insects, drops of water, and the cores of the fruit appearing through the skin, are wonderfully fine.

A Landscape. The trees, and the expression of the light through their branches, exceeding fine.

Next we entered the crimson bed-chamber, which is very handsomely ornamented. The bed is placed in a part separated from the rest of the room by pillars. The dimensions thirty by sixteen. This room opens into the library, forty-five by twenty; the pillars are handsome, but divide the room not in an agreeable manner.

I should further remark, that the particulars of the sitting up and furnishing, not mentioned in the preceding account, are very handsome and elegant. The rooms are hung with crimson, and green silks and damasks; and the cornices, ceilings, door-cases, slab, sofa, and chair-frames, all carved and gilt in a good taste. The chimney-pieces are all very beautiful, being of white marble polished, and some of them elegantly decorated with wreaths and festoons of wrought marble. Most of the slabs are very fine, of various marbles. There is a very beautiful collection of ornamental Dresden and Chelsea porcellane, scattered about the house.

Black-heath is said to have its name from the colour of the soil. It is an extensive plain; and here Wat Tyler, the famous rebel in the reign of Richard II. is said to have mustered near an hundred thousand men. On this heath is an eminence called Shooter's-hill, from whence there is a most extensive and beautiful prospect. Upon the top of this hill is a spring, which constantly overflows, and is never frozen in the severest winters. Some time since, a plan was formed for build-

ing a superb town on this hill, and some of the houses actually finished; but the design was laid aside, on account, as it was said, of the ground being so full of springs, that no cellars could be formed, nor the foundations securely laid.

Woolwich is situated on the southern bank of the Thames, nine miles from London. Here is a royal dock, the oldest in the kingdom, for building ships of war; and also a gun-yard, called the Warren. In the former more ships have been built than in any other two docks in the kingdom; and in the latter, artillery of all kinds and dimensions are cast; and here the company of matrosses are employed in making up cartridges, and in charging bombs, carcasses, and grenades, for the public service. Here are many yards of warehouses, and magazines of military and naval stores; and an academy has been lately established here, for teaching the military sciences, and whatever else relates to the attack and defence of fortified places.

A guardship is generally stationed in the river before the dock-yard, where the water is so deep, that the largest ships may safely ride without touching the ground, even at low water. The town has been, of late years, considerably enlarged, and the parish-church rebuilt in a very handsome manner, as one of the fifty new churches. Here is a weekly market on Friday, but no annual fair.

In the year 1236, the marshes near Woolwich were overflowed by a sudden rise of the Thames, in such a manner, that many of the inhabitants perished, together with vast numbers of cattle; and in the reign of king James I. another inundation happened, by which many acres of meadow-land were laid under water, and have never been recovered.

Leaving Woolwich, we continued our tour towards Greenwich; and in our way, passed through Charton, a very pleasant village, on the edge of Black-heath, remarkable for a fair held on St. Luke's day, called Horn-fair, the only one of its kind in England. It consists of a frolicksome mob, who, after a printed summons dispersed through the several towns and country around, meet at a place called Cuckold's Point, near Deptford, whence they march in procession through that town and Greenwich, to Charlton, with horns of various kinds upon their heads. This assembly used formerly to be infamous for rudeness and indecency, but is now kept in tolerable order by constables, who are ordered to attend: a sermon is also preached at the church of Charlton on the fair-day. We have no account of the origin of this whimsical fair but by tradition, which says, that king John, or some other of our kings, who had a palace at Eltham, in the neighbourhood, having been out a-hunting, rambled from his company to this little hamlet, took a liking to the mistress of a cottage, whom he found alone; and having prevailed over her modesty, the husband surprised them together; and vowing to kill them both, the king was obliged to discover himself, and to compound for their safety by a present of a purse of gold, and a grant of the land from this place to that now called Cuckold's Point, besides making him master of the whole hamlet. It is added, that in memory of this grant, and the occasion of it, the husband established a fair here for the sale of horns, and all sorts of goods made of horn, which are still the chief articles sold at this fair.

Greenwich was originally named Green-wic, which is synonymous with Green Creek, *wic* being the Saxon term for the creek of a river. It stands upon the river Thames, at the distance of six miles from London, is a very populous town, and reckoned one of the genteelst and pleasantest in England, many of its inhabitants being persons of rank and fortune; and its parish-church, which was lately rebuilt, and dedicated to St. Alphage, is a very handsome structure.

There was a royal palace formerly in this town, which was first erected by Humphrey, duke of Gloucester, who called it Placentia. It was enlarged by Henry VII. and completed by his son, Henry VIII. who was so delighted with its situation, that he frequently resided here. Queen Mary and queen Elizabeth

were born in it, and king Edward VI. died in it; but being afterwards much neglected, king Charles II. pulled it down, and began another, of which he lived to see the west wing magnificently finished, at the expence of thirty-six thousand pounds. This wing, together with nine acres of ground belonging to it, king William, in the year 1694, appropriated for a royal hospital for aged and disabled seamen, the widows and children of such as lost their lives in the service of the crown, and for the encouragement of navigation. The other wing was begun in the reign of king William, carried on in the reigns of queen Anne and king George I. and that, together with the rest of the building, was finished in the reign of king George II. Such are the noble symmetry, architecture, and decorations, and such the charming situation, and ample endowment of this spacious and sumptuous edifice, that there is scarce such a foundation and fabric in the whole world. Its hall, which is very superb, was finely painted by the late Sir James Thornhill. At the upper end of it, in an alcove, are portraits of the late princess Sophia, king George I. king George II. the late queen Caroline, the late queen of Prussia, the late prince of Wales, the duke of Cumberland, and his five royal sisters. On the ceiling, above the alcove, are queen Anne and prince George of Denmark; and on the ceiling of the hall are king William and queen Mary, with several fine emblematical figures. On a pedestal, in the middle of the area, fronting a noble terrace by the Thames, is a fine statue of king George II.

The chapel is very fine, the proportion exceedingly beautiful, and forms one of the finest rooms in England. It is one hundred feet long, fifty broad, and fifty high: the ornaments are all white and gold; the cornice very elegant, and the ceiling of the altar truly beautiful: the organ also is fine. It is observable, that though a gallery, in the stile of a shelf, runs on each side the room, yet it has not an heavy effect, which must result from a particular harmony of proportion. Nothing of this sort can be added to a room, without hurting the general effect; but in this the mischief is less than perhaps any where besides. The little ceiling-piece of the altar, done by Mr. Brown, representing cherubims, is elegant, and perhaps worthy the pencil of Albano himself.

In the year 1705, was the first admission of one hundred disabled seamen into this hospital, but the number now is near two thousand men, and one hundred boys. To every hundred pensioners are allowed five nurses, being the widows of seamen, at ten pounds a year, and two shillings a week more to those who attend in the infirmary. The pensioners are clothed in blue, with brass buttons, are allowed stockings, shoes, and linen; and besides their commons, have one shilling a week to spend, and the common warrant officers one shilling and sixpence. The hospital is governed by a governor, a lieutenant-governor, and other officers.

King William gave two thousand pounds a year towards finishing the buildings. The several benefactions to this noble charity, which appear upon tables, hung up at the entrance of the hall, amount to fifty-eight thousand two hundred and nine pounds; and in the year 1732, the late earl of Derwentwater's forfeited estate, amounting to near six thousand pounds a year, was given to it by parliament. A market was appointed in the town of Greenwich in 1737, the direction of which is in the governors of the royal hospital, to which the profits that arise from it are to be appropriated.

There is also a handsome college in this town, fronting the river Thames, for the maintenance of twenty decayed old house-keepers, twelve out of Greenwich, and eight to be presented alternately from Castlerising, a considerable market-town in Norfolk, and Bungey, a market-town in Suffolk. The pensioners, besides victuals and drink, are allowed eighteen pence a week for necessaries, with a gown every year, linen in two years, and hats once in four years. They have also two acres of garden, and a chapel, where prayers are read twice a day, and they are under the government and care of a warden, butler, cook, and matron. This is called the Duke of Norfolk's college, but was founded and en-

dowed in 1613 by Henry earl of Northampton, by the name of Trinity Hospital, and by him committed to the care of the mercers company of London.

Mr. Lambard, author of the Perambulation of Kent, also built an hospital here in 1560, called Queen Elizabeth's College, in which twenty poor persons are maintained. This is said to be the first hospital built by an English protestant.

There are in this town two charity-schools; one built by Sir William Boreman, knight, for twenty boys, and endowed with four hundred pounds a year, in trust to the drapers company of London; the other built by Mr. John Roan, who left an estate of ninety-five pounds a year, in trust with the vicar, church-wardens, and overseers of this parish, for teaching twenty-eight boys, and allowing forty shillings a year for their cloaths.

Here is a noble and most delightful park, enlarged, planted, and walled round by king Charles II. It is well stocked with deer, and has perhaps as much variety, in proportion to its size, as any in the kingdom; but the views from the observatory and one tree hill, are beautiful beyond imagination, particularly the former. The projection of these hills is so bold, that you do not look down upon a gradual falling slope, or flat inclosures, but at once upon the tops of branching trees, growing in knots and clumps out of deep hollows and dells: the cattle feeding on the lawns, which appear in breaks among them, seem moving in a region of fairy land. A thousand natural openings among the branches of the trees, break upon little picturesque views of the swelling turf, which, when illuminated by the sun, have an effect more pleasing than the power of fancy can exhibit. This is the fore-ground of the landscape. A little further, the eye falls on that noble structure the hospital, in the midst of an amphitheatre of wood. Then the two reaches of the river make that beautiful serpentine which forms the Isle of Dogs, and presents the floating millions of the Thames. To the left appears a fine tract of country leading to the capital, which there finishes the prospect.

On the top of a steep hill, in this park, Humphrey, duke of Gloucester, began a tower, which was finished by king Henry VII. but afterwards demolished, and a royal observatory erected in its place by king Charles II. furnished with all sorts of mathematical instruments for astronomical observations, besides a deep dry well for observing the stars in the day-time. This place was successively the residence of those celebrated astronomers, Mr. Flamsteed, Dr. Halley, and Dr. Bradley. From Mr. Flamsteed this observatory took the name of Flamsteed House, by which it is now commonly known, and is at present in possession of Mr. Maskelyne, as astronomer to his majesty.

There is still a royal palace in this town, but it is a small building, and is converted into apartments for the governor of the royal hospital, and the ranger of Greenwich Park. This town of Greenwich is the chief harbour for the king's yachts.

Here was formerly an alien priory of friars Minorites, belonging to Gaunt, till the suppression of foreign monasteries, when the house was given to the abbey of Shene, in Surry.

Greenwich has two weekly markets, held on Wednesday and Saturday; but no annual fair; though there are two on the neighbouring heath, viz. the twelfth of May, and the eleventh of October.

In a field, called Great Stone Field, on the south side of Greenwich, and on the side of Black-heath, is an hospital called Mordaunt's College, built by Sir John Mordaunt, Bart. a Turkey merchant. It is a spacious structure, and intended for the reception of decayed merchants. The number of pensioners is not limited, but the buildings and endowments will admit of forty. Seven Turkey merchants have the direction and visitation of this hospital, as well as the nomination of the pensioners, each of whom must produce a certificate of his being above sixty years of age, before he can be admitted: each has fifteen pounds a year. The chapel is very neatly wainscotted, and has a curious altar-piece: the founder was buried under the communion-table.

The treasurer has forty pounds a year; and the chaplain, who reads prayers twice every day, and preaches twice every Sunday, has sixty pounds.

About a mile west of Greenwich, and on the river Thames, is Deptford, so called from the deepness of the ford over the river Ravensbourn, before a bridge was erected over that stream. This town, though it has no market, is a very populous place, and divided into two parts, called the Upper and Lower Town. It has also two churches, the newest of which was one of the fifty new churches erected by the commissioners, pursuant to an act of parliament passed in the reign of queen Anne.

But what renders Deptford famous, is its royal dock, constructed above two hundred years since. Here are also store-houses of every kind; one of which, namely, the Victualling Office, built in 1745, was, by accident, burnt down in January 1748-9, and a great quantity of provisions and other stores consumed. This building was intended to supply the place of the Old Victualling-office on Tower-hill, the lease of which was then almost expired.

In this town are two hospitals belonging to what is called the Trinity-house of Deptford Strond. The buildings were erected at two different times, and the old part contains twenty-one houses, and the new thirty-eight. The latter is much the finer edifice, and has large gardens, well kept, belonging to it. But notwithstanding this, the other has the preference, on account of its antiquity, and the meetings of the corporation of Trinity-house, which they are obliged, by their charter, to hold there at certain times. Both these houses are intended for decayed pilots, masters of ships, or their widows. The men are allowed twenty shillings, and the women sixteen shillings a month.

The society of Trinity-house was founded in the year 1515, by Sir Thomas Spert, Knt. commander of the great ship Henry Grace de Dieu, and comptroller of the navy to Henry VIII. for the regulation of seamen, and the convenience of ships and mariners on our coast, and incorporated by the above-mentioned prince, who confirmed to them not only the ancient rights and privileges of the company of mariners of England, but their several possessions at Deptford; which, together with the grants of queen Elizabeth and king Charles II. were also confirmed by letters patent of the first of James II. in 1685, by the name of "The Master, Wardens, and Assistants of the Guild or Fraternity of the most glorious and undivided Trinity, and of St. Clement, in the parish of Deptford Strond, in the county of Kent."

This corporation is governed by a master, four wardens, eight assistants, and eighteen elder brethren; but the inferior members of the fraternity, named Younger Brethren, are of an unlimited number, for every master or mate expert in navigation, may be admitted as such; and these serve as a continual nursery to supply the vacancies among the elder brethren, when removed by death, or otherwise.

The master, wardens, assistants, and elder brethren, are by charter invested with the following powers:

1. That of examining the mathematical children of Christ's Hospital.
2. The examination of the masters of his majesty's ships; the appointing pilots to conduct ships in and out of the river Thames; and the amercing all such as shall presume to act as master of a ship of war or pilot, without their approbation, in a pecuniary mulct of twenty shillings.
3. The settling the several rates of pilotage, and erecting light-houses, and other sea-marks upon the several coasts of the kingdom, for the security of navigation; to which light houses all ships pay one half-penny a tun.
4. The granting licences to poor seamen, not free of the city, to row on the river Thames for their support, in the intervals of sea-service, or when past going to sea.
5. The preventing of aliens from serving on board English ships, without their licence, upon the penalty of five pounds for each offence.
6. The punishing of seamen for desertion or mutiny, in the merchants service.

7. The hearing and determining the complaints of officers and seamen in the merchants service; but subject to an appeal to the lords of the admiralty, or the judge of the court of admiralty.

To this company belongs the ballast office, for clearing and deepening the river Thames, by taking from thence a sufficient quantity of ballast, for the supply of all ships that sail out of that river; in which service sixty barges, with two men in each, are constantly employed; and all ships that take in ballast pay them one shilling a ton, for which it is brought to the ships sides.

In consideration of the great increase of the poor of this fraternity, they are by their charter impowered to purchase in mortmain lands, tenements, &c. to the amount of five hundred pounds *per annum*; and also to receive charitable benefactions of well-disposed persons, to the like amount of five hundred pounds *per annum*, clear of reprises.

There are annually relieved by this company about three thousand poor seamen, their widows and orphans, at the expence of about six thousand pounds.

They commonly meet to chuse their master at their house in Deptford, but are not obliged to do it there.

What is called the Red-house, is a place situated a little to the north-west of Deptford, and was a noted collection of warehouses and storehouses, built of red bricks, and from that circumstance had its name. It contained several sorts of merchandizes, as hemp, flax, pitch, tar, and other commodities of a similar kind, which were all consumed by an accidental fire in July, 1739.

Remarks on the SEA-COASTS of Kent.

On the southern point of the county, called Dungeness, is a light-house, erected for the benefit of mariners. A neck of beach stretches off a great distance into the sea from this point, part of which is dry at low water. In Romney-bay, a little to the eastward of Dungeness, is a good road for ships in northerly winds.

About five or six miles to the southward of the South Foreland, is a sand called the Gunman: on this sand there is only twelve feet at low water.

The Downs is a noted road for ships, and is a bay formed by two head-lands, called the North and South Foreland, and defended, in some measure, from easterly winds, by large sand-banks, called the Godwin Sands, which, for near three leagues together, lie parallel to the coast, at about a league and a half distance, and are dry at low water.

But notwithstanding these sands, and the two head-lands above-mentioned, the Downs, in some particular winds, proves such a wild road, that ships are often driven from their anchors, and either forced on shore, or into Ramsgate pier, &c. This road is particularly exposed to south-east, and east-north-east winds; so that when a storm happens from either of those points of the compass, dreadful havock is generally made among the ships in this road.

But the most unhappy instance that can be given of any disaster in the Downs, was in that terrible tempest which happened on the seventeenth of November 1703, when a great part of the royal navy happened to be riding there.

Five of the largest ships had the good fortune to pass through the Downs the day before the storm; and the wind blowing then very hard, came to an anchor at the Gunfleet.

Twelve sail remained in the Downs when this terrible tempest began; and during the continuance of it, four men of war, with the greater part of their crews, were lost, besides a great number of merchantmen.

Ramsgate lies near the northern extremity of this road. A pier is now building here, which, it is hoped, will prove a place of safety to ships in the Downs, when a storm happens at south-east. The works of this pier are amazingly strong, consisting of large columns of stone, connected together in the most sub-

stantial manner. The stone is brought from the Isle of Purbeck, in Dorsetshire. The works are considerably advanced; and when the pier is cleared, there will be water sufficient for large ships. At present, there are only ten feet at high water on a common tide, and fourteen on a spring-tide. But when the works are completed, the depth will be near double to what it is now. The pier will indeed, for want of a sufficient quantity of back-water, be liable to be choaked up with beach and sand, and consequently, attended with a continual expence, to remove what is thrown in by the tide. But we apprehend, the advantages arising from having a place of safety situated so properly for succouring ships in distress, will amply balance the inconveniency above-mentioned.

The first road for ships, after passing by the North Foreland, is the bay before Margate, where there are between eight and nine fathoms water; but there are so many sands and shallows near it, that none but those well acquainted with the coast venture to enter it, especially if the ship be large. There is also a pier at Margate for small vessels; but the entrance is rendered somewhat dangerous, by a ledge of rocks, which stretches off from the western cliff to a very considerable distance.

From hence, all the way up the channel to Tilbury-fort and Gravesend, there are a great variety of sand-banks, some of which have buoys fixed upon them by order of the Trinity-house: so that a skilful pilot is necessary for large ships. Small vessels indeed pass up and down this channel without danger, there being water sufficient for them in almost any part.

The Nore is a noted road for ships, and lies before the western mouth of the Medway, called the West Swale. Ships ride here in great safety, except in easterly and north-east winds, when it is wholly without shelter. Here properly begins the mouth of the Thames, so much frequented by ships from all parts of the world, where navigation is known, and any foreign trade carried on.

Curious PLANTS found in Kent.

Thorough-wax, *Perfoliata*, *Ger.* found among the corn near Canterbury.

Spoon-wort, or Scurvy-grass, *Cochliaria*, *Ger.* found in various parts of the sea-coasts of this county. There are two species of this plant, both of which are found in great plenty along the coast of Romney-marsh.

Greek Valerian, or Jacob's Ladder, *Valeriana Græca*, *Ger.* found in the woods near Tunbridge-wells.

Wild Valerian, *Valeriana sylvestris*, *Ger.* found in several parts of this county, especially in the neighbourhood of Goudhurst.

Marsh Marygold, *Caltha palustris*, *flore pleno*, *C. Baubino*, found in the marshes in the Isle of Shepey.

Sea-purslane, *Portulaca marina nostris*, *Park*, found in the marshes of Shepey.

Lellow Water-lilly, *Nymphaea lutea*, *Ger.* found in many parts of the rivers Stour and Medway.

Wild-vine, *Papeira brava*, *Dale*, found in the hedges near Eltham.

Water-plantain, *Plantago aquatica*, *J. B.* found on the sides of the Cray, in several places.

Moon-wort, *Lunaria minor*, *Ger.* found on the commons near Canterbury.

Male and female Satyrion, *Cynorhynchis mas et femina*, *Ger.* found in the meadows near Maidstone.

Male Satyrion Royal, *Archis palmata non maculata*, *Ray*, found in the moist meadows near Tunbridge.

Butterfly, or German Satyrion, *Orchis hermaphroditica*, *Ger.* found in the woods near Wye.

Hogs-fennel, *Pucadaneum*, *Ger.* found near the sea-shore at Deal, and other parts.

Wild Marjoram, *Originum vulgare spontaneum*, found in the fields near Sevenoke.

Osmond Royal, *Filix floribus insignis*, *J. B.* found on a boggy common near Tunbridge.

Buckthorn, *Rhamnus cathartica*, *J. B.* found in the hedges near Ashford.

Wild-

Wild-rue, *Ruta Montana*, Ger. found on the downs between Canterbury and Dover.

Broom-rape, *Orobauche flore majore*, J. B. found among the broom in several parts of Kent.

Mullein, *Tapsus Barbatus*, Ger. found by the sides of the highways near Dartford.

ROMAN COINS, and other ANTIQUITIES found in Kent.

We have already enumerated a great variety of coins, &c. found in this county, and therefore shall not repeat them here. Besides which, may be mentioned a considerable quantity of Roman and ancient British coins dug up near Wrotham in the last century; and since that time, several small pieces of brass were found in a place called the Camps, supposed to have been pieces of some military officer there interred. In several of the camps at Keyston, near Bromley, Roman coins have been often found; as there have also been at Chilham, and other places in this county. A great variety of rings, bracelets, coins, and other pieces of antiquity, have been found at Dover, Sandwich, Reculver, Canterbury, and Rochester.

MINERAL WATERS found in Kent.

The principal mineral waters found in this county, are those of Tunbridge, Bromley, and Canterbury. Accounts have already been given of the two former, and we shall here say something of the last.

The mineral waters at Canterbury were discovered by accident, about thirty years ago, by sinking a well. After passing through several layers of mould, sand,

&c. they found, about eight or nine feet below the surface, a hard rock, out of which the water gushed with some violence; and, upon examination, appeared to be strongly impregnated with iron and sulphur.

Several remarkable cures have been performed by the use of these waters since their discovery. They are very useful in diseases of the breast, as asthma, coughs, rheums, and catarrhs. They have cured several afflicted with consumptions in the lungs, after they had been given over by their physicians. Most disorders of the stomach are cured by this water; and it seldom fails in rheumatic and gouty pains, the scurvy, jaundice, &c. but hardly ever fails in the gravel, cholic, and green sickness.

In agues it is reckoned superior to the bark: some constitutions quite worn out by that disease, have been restored by a constant use of it. It agrees both with old, decayed, and weak constitutions, sits pleasantly on the stomach, works off by urine, causes a good appetite, cheers the spirits, and procures sleep. It is not binding, as some other chalybeats are, but keeps the body open in most people, and in some brings on a gentle looseness, which carries off the distemper.

MEMBERS of PARLIAMENT for this COUNTY.

This county sends eighteen members to parliament, two knights of the shire for the county; two citizens for each of the cities of Canterbury and Rochester; two burgessees for the boroughs of Maidstone and Queenborough; and two members, stiled Barons, for each of the Cinque-ports of Dover, Sandwich, Hith, and Romney.

M I D D L E S E X.

THE county of Middlesex is bounded on the north by Hertfordshire; on the south by the river Thames, which divides it from Surry; on the west by the river Colne, which separates it from Buckinghamshire; and on the east by the river Lee, which divides it from Essex. It extends about twenty-four miles in length, but hardly eighteen in breadth; and is not more than ninety-five in circumference; but as it comprehends the two vast cities of London and Westminster, which are situated in the south-east part of the county, it is by far the wealthiest and most populous county in England. It is divided into six hundreds and two liberties, containing seventy-three parishes, besides a vast number of chapels of ease, and five market-towns, exclusive of the cities of London and Westminster.

R I V E R S.

The rivers in this county are, the Thames, the Lee, the Colne, and the New River. But as neither of these rises in Middlesex, and at the same time, water the counties of Berks, Bucks, Essex, and Hertford, as well as the county of Middlesex, we shall describe each in the respective county to which it immediately belongs, except the New River, an account of which will be given in its proper place.

AIR, SOIL, and PRODUCTIONS.

The air of Middlesex is very pleasant and healthy, to which a fine gravelly soil does not a little contribute. The soil produces plenty of corn, and the county abounds with fertile meadows and gardeners grounds. In a word, the greater part of the county is so prodigiously assisted by the rich compost from London, that the whole of the cultivated part may be considered as a garden. The natural productions of this county are cattle, corn, and fruit; but its manufactures are too many to be enumerated here, there being hardly a single manufacture practised in Great Britain, but what is also practised in this county.

We should now, according to the method hitherto followed, proceed to consider the husbandry of this populous county; but shall defer that account till we have described the cities, market-towns, &c. in Middlesex.

CITIES, MARKET TOWNS, &c.

London and Westminster, though distinct cities with regard to their jurisdictions, and formerly, indeed, with regard to their situations, are now united by the suburbs of both cities, so as to form one vast metropolis. The borough of Southwark, in the county of Surry, which is also united to London by two bridges over the Thames, is only a member or suburb of the city of London, and was erected, during the reign of Edward VI. into a new ward, by the name of Bridge-ward Without. But the power granted by the charter not proving sufficient to exclude the justices of peace for the county of Surry from interfering in its government, it is now only a nominal ward. It is, however, represented by a senior alderman, called the Father of the City. The cities of London, Westminster, and borough of Southwark, are indiscriminately comprehended by the general name of London, notwithstanding each differs in the manner of its government, and each, as a distinct corporation, sends members to parliament.

The name London has scarcely suffered any variation since the time of the Romans; for it is called Londinium and Longidinium by Tacitus, Ptolemy, and Antoninus; and flourished so much under the Romans, that they

changed this name to that of Augusta, as appears from Ammionus Marcellinus, who lived in the time of the emperor Valentinian. The name Augusta was thought the most honourable and auspicious that could be conferred, and was never given without the consent of the Roman emperors: but whether it had the name Augusta from Hellena Augusta, the mother of Constantine the Great, or from the Legio Secunda Augusta, that resided for some time in this city, does not appear. It is only known, that this city, some time afterwards, lost the name Augusta, and recovered its ancient name, London, by which it is called at this day.

London is situated in fifty-one degrees and thirty minutes north latitude; and being the metropolis of the British dominions, is the meridian from which all British geographers compute the measures of longitude.

London is supposed to be equal, if not superior, to every other city upon earth, for the numbers and wealth of its inhabitants, its extensive commerce, its admirable policy, its many establishments to promote literature, manufactures and trade, and its numerous foundations of charity to support the indigent, and relieve every species of distress. It was a Roman city; and very early under the Romans was celebrated for the multitude of its merchants, and the vast extent of its trade. During the Saxon heptarchy, it was the metropolis of the kingdom of the East Saxons, and was always the chief residence of the kings of England. Its first charter from William the Conqueror, dated in the year 1067, is still preserved in the city archives. But as the most succinct history that could be drawn up of this great and ancient city, would much exceed the utmost bounds that can be allotted to the whole article in this work, it is necessary to proceed to a description of its present state.

London is situated to great advantage, on the north side of the Thames, on a gentle rise from that river, and on a gravelly and loamy soil, which conduces very much to the health of its inhabitants. The country round it consists of gardeners grounds, delightful plains, and beautiful elevations, adorned with a great number of magnificent country houses, belonging to the citizens.

For twenty miles round London, the roads leading to it are the finest that can be imagined; being kept in constant repair by a toll collected at turnpikes; and the distances from London, in all the great roads to it throughout Britain, are marked on stone-posts, called Mile-stones, set up, one at the end of every measured mile.

No city is better lighted in the night than London, the allowance for the public lamps being more than ten thousand pounds a year, exclusive of many thousand lamps belonging to public houses and others, which are lighted at the private expence of particular citizens.

The cities of London and Westminster are better supplied with water than perhaps any other in the world: almost every house is furnished with pipes, which bring it in great plenty from the Thames, the New River head, or from some ponds at Hampstead, a village in the neighbourhood. The city also abounds with fine springs, some of which are medicinal.

London and Westminster are reckoned to extend seven miles and an half in length, from Blackwall in the east, to Tothill-fields, or to the fields beyond Grosvenor and Cavendish squares, in the west; and six miles three quarters along the Thames, from Poplar to Peterborough-house, beyond Westminster horse-ferry. The breadth, from Newington Butts, on the south side of the borough of Southwark in Surry, to Jeffrey's alms-houses in Kingland-road in Middlesex, is three miles thirty-one poles; though in other places, as from Peterborough house

house to the British Museum, it is but two miles; and in others, as in Wapping, not half a mile: and the circumference is judged to be at least eighteen miles.

In the year 1739, it was computed, that in the cities and suburbs of London and Westminster, there were five thousand and ninety-nine streets, lanes and alleys; ninety-five thousand nine hundred and sixty-eight houses, and about seven hundred and twenty-six thousand inhabitants. But since this computation, many new streets have been built.

The civil government of the city of London, as distinct from Westminster, is vested in a mayor, who has the title of Lord, twenty-six aldermen, a recorder, a chamberlain, two hundred and thirty-six common-councilmen, and other officers.

The lord mayor is elected annually at Guildhall, on Michaelmas day, when the aldermen below the chair, who have served the office of sheriff, are put in nomination, out of whom the liverymen, who are chosen from among the freemen of each company, and are about eight thousand in number, return two to the court of aldermen, who usually chuse the senior alderman. Upon the eighth of November, he is sworn into his office at Guildhall, and the next day he is inaugurated at Westminster. For this purpose, he is met in the morning by the aldermen and sheriffs at Guildhall, from whence they ride, with great state, in their coaches, to the stairs on the Thames side, called the Three Cranes, where they take water in the lord mayor's barge, being attended by the barges of the twelve principal companies, and others, in their furred gowns, with their music, colours, and streamers; and saluted from the shore and water by great guns. After landing at Palace-yard, Westminster, the companies march in order to Westminster-hall, followed by the lord mayor and aldermen. Having entered the hall, they walk round it with the city sword and mace carried before them, to salute the courts sitting there; and then walk up to the court of exchequer, where the new lord mayor is sworn before the barons. His lordship then walks round the hall again, and invites the judges to dinner at Guildhall; after which, he returns with the citizens by water to blackfriars; from whence they ride in their coaches, preceded by the artillery company, being a band of infantry, constituting part of the city militia, in buff coats; and attended by the city companies, with their flags and music, to Guildhall, where they generally meet the lord chancellor, the judges, several of the nobility, the ministers of state, and foreign ambassadors, who are invited to a magnificent entertainment; which is also sometimes honoured with the presence of the king, queen, and princes of the blood.

The lord mayor's jurisdiction extends, in some cases, a great way beyond the city; not only over a part of the suburbs, but upon the river Thames, east as far as its conflux with the Medway, and west to the river Colne: and he keeps courts annually for the conservation of the river Thames, in the counties it flows through, within the limits already mentioned. He always appears abroad in a state coach; he is robed in scarlet or purple, richly furred, with a hood of black velvet, a great gold chain, or collar of SS, and a rich jewel hanging to it; and his officers walk before, or on each side of his coach. He usually goes on Sunday morning, attended by some of the aldermen, to St. Paul's cathedral, where, on the first Sunday in term-time, all or most of the twelve judges are present, whom, after divine service, he invites to dinner. If a lord mayor elect refuses to serve, he is liable to be fined.

The city is divided into twenty-six wards; over each of these wards there is an alderman; and on the death of any of the twenty-six aldermen, the wardmote, which is a court kept in every ward of the city, upon a precept immediately issued by the lord mayor, meet and return the names of two substantial citizens to his lordship, and his brethren the aldermen, who chuse one of them; and he that is chose must serve, or pay a fine of five hundred pounds. All the aldermen are justices of the peace in the city by charter.

The two sheriffs of this city, which is a county of

itself, are also sheriffs of the county of Middlesex; and are chosen at Guildhall on Midsummer-day, by the liverymen, but not sworn till Michaelmas-eve, when they enter on their office; and two days after, are presented in the Exchequer-court in Westminster-hall, to the lord chancellor, by the lord mayor and aldermen. Each sheriff has an under-sheriff, six clerks, thirty-six serjeants; and every serjeant a yeoman, who belongs to either of the prisons, called Woodstreet Compter, or the Poultry Compter. If the person chosen sheriff does not chuse to serve, he is fined four hundred pounds to the city, and thirteen pounds six shillings and eightpence to the ministers of the city prisons, unless he swears himself not worth ten thousand pounds; and if he serves, he is obliged to give bond to the corporation.

After the sheriffs are elected, the livery chuse the chamberlain of the city, and other officers, called the Bridge-masters, auditors of the city and bridge-house accounts, and the ale-conners. The recorder is appointed by the lord mayor and court of aldermen: his place is for life.

The common-council, constables, and other officers, are chosen by the housekeepers of the ward, on St. Thomas's day, at a wardmote then held by the aldermen.

The court of common-council, which is the name given to the assembly of the lord mayor, aldermen, and common-councilmen, make bye-laws for the city, and, upon occasion, grant freedoms to strangers. It is called and adjourned by the lord mayor; and out of it are formed several committees for letting the city lands, and other services.

The lord mayor and court of aldermen are a court of record, in which all leases and instruments are executed, that pass under the city seal. They fix the price of bread, determine all differences relating to lights, water-courses, and party-walls; suspend or punish offending officers, and annually elect the rulers of the watermen's company. They also appoint most of the city-officers, as the four common pleaders, the comptroller of the chamber, the two secondaries, the remembrancer, the city solicitor, the sword-bearer, the common hunt, the water-bailiff, four attornies of the lord mayor's court, the clerk of the chamber, the three serjeant carvers, three serjeants of the chamber, the serjeants of the channel, the two marshals, the hall-keeper, the yeomen of the chamber, four yeomen of the water-side, the yeomen of the channel, the under water-bailiff, two meal-weighers, two fruit-meters, the foreign-taker, the clerk of the city works, six young men, two clerks of the papers, eight attornies of the sheriffs-court, eight clerk-fitters, two prothonotaries, the clerk of the bridge-house, the clerk of the court of requests, the beadle of the court of requests, thirty-six serjeants at mace, thirty-six yeomen, the gauger, the sealer and searchers of leather, the keeper of the green-yard, two keepers of the two compters, of Newgate and of Ludgate, the measurer, the steward of Southwark, the bailiff of the hundred of Ossulston, and the city artificers: but the rent-gatherer is put in by Mr. Chamberlain, and the high bailiff of Southwark by the common-council.

The court of Hustings, thus called from the Danish Hus-ding, (i. e. a house of judgment) is reckoned the most ancient tribunal in the city, and was established for the preservation of its laws, franchises, and customs. It is held at Guildhall, before the lord mayor and sheriffs, and the recorder, who, in civil causes, sits there as judge. Here deeds are inrolled, recoveries passed, wills proved, and outlawries sued out; and writs of right, waste, partition, dower, and replevins, determined. Here also the four representatives of this city in parliament are elected by the liverymen of the city, who, out of eight candidates that are usually set up, make choice of four.

The lord mayor's court is likewise a court of record and of equity, held in the chamber of Guildhall every Tuesday, where the recorder also sits as judge, and the lord mayor and aldermen may, if they please, sit with him. Actions of debt, trespass, and others, arising within the city and liberties, of any value, may be entered and tried in this as in other courts; and an action

may be removed hither from the sheriffs courts, before the jury is sworn. This court has an office peculiar to itself, consisting of four attornies, and six serjeants at mace. The juries for trying causes in this and in the sheriff's court are returned by the several wards, at their wardmote inquests at Christmas, when each ward appoints the persons to serve on juries, for every month in the ensuing year.

The sheriffs have two courts, which also are courts of record for the trial of actions of debt, case, trespass, account, covenant, attachments and sequestrations. They are held on Wednesday and Friday for actions entered in Woodstreet-compter, and on Thursday and Saturday for such as are entered in the Poultry-compter. To these courts belong eight attornies, two secondaries, who allow and return all writs, two clerks of the papers, who copy subpœnas, two prothonotaries, who copy declarations, and eight clerk-fitters, who enter actions and take bails.

The chamberlain has a court or office, which is held at the chamber in Guildhall. He receives and pays all the city cash, keeps the securities taken for it by the court of aldermen, and annually accounts to the auditors appointed for that purpose. He attends every morning at Guildhall, to inroll or turn over apprentices, or make them free, and hears and determines differences between them and their masters.

The orphans court is a court held by the lord mayor and aldermen, once a year or oftner, for managing the affairs of the city orphans, or freemens children, under twenty-one years of age. The common serjeant takes inventories of such freemens estates, and the common crier summons their widows, or other executors and administrators, to appear before the court of aldermen, to bring in an inventory, and give security for the testator's estate. When the orphans are of age, or are married with consent of the court of aldermen, they may receive their portions upon demand.

The court of conscience is a court erected by act of parliament, in the year 1606, for recovering debts under forty shillings, at an easy expence; the creditor's oath of the debt being sufficient to ascertain it, without further evidence. Two aldermen and four commoners, those of each ward being appointed monthly in their turn by the lord mayor and court of aldermen, sit at the hustings in Guildhall, every Wednesday and Saturday, as commissioners of this court.

A wardmote court is a court held by the aldermen of each ward, for chusing the officers, and settling the affairs of the ward; and this court presents such offences and nuisances to the lord mayor, and common-council, as demand redress.

A hallmote court is so called, because it is held by the governors of the several companies, at their respective halls. The intention of this court is to regulate matters relating to the trade of each company.

The military government of this city is lodged in a lieutenantancy, consisting of the lord mayor, aldermen, and other principal citizens, who receive their authority from the king, by commission. These have under their command, the city trained bands, consisting of six regiments of foot, distinguished by the names of the white, orange, yellow, blue, green and red; each consisting of eight companies of one hundred and fifty men each, and the whole of seven thousand two hundred men. Besides these six regiments, here is a corps called the artillery company, from its being taught the military exercise in the Artillery ground. This company is independent of the rest, and consists of seven or eight hundred volunteers. All these, with two regiments of foot, of eight hundred men each, commanded by the lieutenant of the Tower of London, make the whole militia of this city, exclusive of Westminster and Southwark, above ten thousand men, including officers and drums.

London is a bishop's see, the diocese of which not only comprehends Middlesex, Essex, and part of Hertfordshire, but the British plantations in America. The bishop of London takes place next to the archbishops of Canterbury and York: But the following parishes of this city are exempt from his jurisdiction, being pecu-

liars under the immediate government of the archbishop of Canterbury: Alhallows in Breadstreet, Alhallows Lombard-street, St. Diony's Back-church, St. Dunstan's in the East, St. John Baptist, St. Leonard's Eastcheap, St. Mary Aldermary, St. Mary Bothaw, St. Mary le Bow, St. Michael Crooked-lane, St. Michael Royal, St. Pancras Soper-lane, and St. Vedast Foster-lane. Before the great fire, which in 1666, burnt down almost all the city of London, and is thence called the Fire of London, there were ninety seven parishes within the walls of this city, and seventeen without, which made the number of parishes in the city and liberties one hundred and fourteen, exclusive of those in the city and liberties of Westminster, and in the borough of Southwark. There are however at present no more than sixty-two parochial churches in the city and liberties of London, and consequently no more parish priests.

The dreadful fire above-mentioned, broke out about one in the morning on Sunday the second of September, in the house of Mr. Farryner, a baker, in Pudding-lane; a time when the eyes and senses of all were locked in sleep. The house was a wooden building pitched on the outside, as were all the rest in the lane, which was exceeding narrow, and by the jutting over of the several stories the buildings on each side almost met at the top; and in this manner were built most of the houses in this metropolis. The house in which the fire began, containing much brush and faggot wood, the fire soon got a-head, and furiously seized on the neighbouring houses on all sides, running four ways at once; it presently set New Fish-street all in a flame; while another branch raging down Pudding-lane, laid hold on Thames-street, the repository of all combustibles, as hemp, flax, rosin, oil, butter, pitch, tar, brimstone, cordage, hops, sugar, brandy, wood, and coals; where dividing itself, it ran both eastward and westward with inexpressible fury, into the adjacent lanes, consuming all before it; and its two main branches meeting at London bridge, soon reduced all the buildings upon it to ashes, together with the water engines under it; by which means the people were deprived of the assistance of that element; for the new river was not then laid into those parts.

The pulling down-houses every way, at some distance, was first proposed; and this was the only method that could have been of any service in stopping the progress of the flames; for had there been water, the fire was too fierce to be mastered by the engines, or to suffer any body to work near it; but this was objected to, and while the affair was debated, the flames spread still farther.

Unhappily they were increased by a violent easterly wind; and that day and the following night spread up Gracechurch-street, and downwards from Cannon-street to the water side, as far as the three Cranes.

The people in all parts were distracted at seeing the progress of the fire, and by the care of carrying off their goods. However many attempts were now made to prevent its spreading, by pulling down houses, and making great intervals; but not having time to remove the materials, the fire seized upon the timber, boards, laths, and rubbish, and extended itself over these spaces to the neighbouring houses; raging in a bright flame all Monday and Tuesday, without any endeavours to stop it proving effectual; though his Majesty, the Duke of York, and great numbers of the nobility and gentry came with the guards, who were employed in endeavouring to extinguish it.

The wind, however, slackened a little on Tuesday night, when the fire, meeting at the Temple with brick buildings, it by little and little lost its force on that side, so that on Wednesday morning a stop was put to it on the west, at the Temple church, and also at Holborn bridge and Pye-corner. On the north, it stopped at Aldersgate, Cripplegate, near the north end of Basinghall-street, and in Coleman-street: on the east, at the fourth corner of Bishopsgate-street and Leadenhall-street, at the church in Fenchurch-street, and at the Tower dock, after its having consumed all the buildings within these limits, quite down to the water side.

On Thursday the flames were extinguished; but that evening the fire burst out again at the Temple, by the falling of some sparks upon a pile of wooden buildings; but upon blowing up the houses around it with gunpowder, it was extinguished the next morning.

By this dreadful conflagration were consumed four hundred streets and lanes, thirteen thousand two hundred houses, the cathedral church of St. Paul, eighty-six parish-churches, six chapels, the Royal Exchange, Blackwell Hall, and the Custom-house, several hospitals and libraries, fifty-two of the companies halls, and a vast number of other stately edifices, together with three of the city gates, four stone bridges, and four prisons; the loss of which, with that of the merchandize and household furniture, amounted, according to the best calculation, to ten millions, seven hundred and thirty thousand, five hundred pounds: but it is amazing, that in this terrible devastation, only six persons lost their lives by the fire.

As by the dreadful ravages of the plague the preceding year, the city was depopulated, and the houses deprived of their inhabitants; so by this conflagration the surviving citizens were deprived of their habitations, and many thousands of them compelled to retire to the fields, with such of their effects as they were able to save, where they continued destitute of the conveniences, and almost all the necessary accommodations of life; lying in the open air, till tents and slight wooden huts could be erected, to secure them from the inclemencies of the weather. Mean-while, the king had the goodness to order a considerable quantity of naval bread to be immediately distributed among the poor; and a proclamation was wisely published, ordering the neighbouring justices to encourage the bringing in of all sorts of provisions.

It has been much disputed, whether this dismal catastrophe was occasioned by accident or design. An attempt was first made to fix it upon the dissenters, who suffered as much by this calamity as any other body of men; but having not the least colour for such a pretence, it dropped of course; and the English being then at war with the French and the Dutch, the latter were charged with concerting this diabolical scheme; but this was found to be only an injurious aspersions: however, Robert Hubert, a Frenchman, of the Romish church, confessed, that he, at the solicitation of one Stephen Piedloe, set fire to the baker's house in Pudding-lane, by means of a fire-ball which he fixed to the end of a long pole, and lighting it with a match, put it in at a window; and that for this villainy he was to be rewarded on his return to France; but it is generally allowed, that this man was at that time disordered in his senses; and great pains have been taken to prove, that he had no hand in that calamity: however, he was condemned and executed, though he surrendered himself, and though there was no other evidence of his guilt than that of his own confession.

It is observable, that the preceding spring and summer had been the driest in the memory of man; whereby the houses, which were all built of wood, and without party walls, were prepared, as it were, by Heaven, to become fuel for this terrible conflagration, which, together with the east wind above-mentioned, might possibly be alone sufficient to reduce the city to a heap of ashes.

But whatever the unhappy citizens of London might then suffer, it is evident, that this was one of the greatest blessings that could have happened for the good of posterity; for instead of very narrow and incommodious streets; instead of dark, irregular, and ill-contrived wooden houses, with their several stories projecting over, obstructing the circulation of the air, and harbouring those noxious particles that occasioned the frequent return of the plague, and often fires of the most dreadful kind; by the modern way of building, and the enlarging of many of the streets, offensive vapours are expelled; and this, added to the cleanliness produced by the great quantities of the water brought into London by the New River, has freed this city from all pestilential symptoms for above ninety years together.

The reduction of this great and opulent city to a heap of rubbish, greatly affected the whole nation; and the king desiring it should be now erected with greater magnificence, uniformity, and safety, than before, prohibited, for some time, the rebuilding of the houses; and the judges were ordered by parliament to hear and determine all disputes between landlords, tenants, and lessees, concerning the rebuilding and repairing of houses, &c. without fee or reward.

London indeed might now have been rebuilt in such a manner, as to have exceeded in beauty all the cities upon earth; and this would have been the case, had either of the following plans been followed. The first was formed by Sir Christopher Wren, who, pursuant to the royal commands, traced over the great plain of ashes and ruins, and thence formed his plan of a new city, free from all the deformities and inconveniences of the old one, by enlarging the streets and lanes, and rendering them as nearly parallel to each other as possible; by seating all the parish-churches in a conspicuous manner; by forming the most public places into large piazzas, the centres of eight ways; by uniting the halls of the twelve companies into one regular square annexed to Guildhall; by making a spacious and commodious quay along the whole bank of the river, without any interruptions, from Black Friars to the Tower, with some large docks for barges deep laden.

The streets were to be of three magnitudes; the three principal leading straight through the city, and one or two cross streets to be at least ninety feet wide; others sixty feet, and the lanes about thirty feet, excluding all narrow dark alleys, thoroughfares, and courts.

The Exchange to stand free in the middle of a piazza, and to be the centre of the town, from whence the streets should proceed to all the principal parts of the city; the building to be after the form of a Roman forum, with double porticoes.

Many streets were also to radiate upon the bridge. Those of the first and second magnitude to be carried on as straight as possible, and to center in four or five areas surrounded with piazzas.

The churches were to be designed according to the best forms for capacity and hearing; and those of the larger parishes adorned with porticoes, and lofty ornamental towers and steeples: but all church-yards, gardens, and unnecessary vacuities, and all trades that use great fires, or yield noisome smells, were to be placed out of the town.

This plan, which that great architect laid before the King and the House of Commons, is thus explained. From that part of Fleet-street which remained unburned, a straight street of ninety feet wide was to extend; and, passing by the south side of Ludgate, was to end gracefully in a piazza on Tower-hill.

In the middle of Fleet-street was to be a circular area surrounded with a piazza, the centre of eight ways, where, at one station, were to meet the following streets.

The first, straight forward, quite through the city: the second, obliquely towards the right hand, to the beginning of the quay that was to be run from Bridewell dock to the Tower: the third, obliquely on the left, to Smithfield: the fourth, straight on the right, to the Thames: the fifth, straight on the left, to Hatton Garden and Clerkenwell: the sixth, straight backwards to Temple Bar: the seventh, obliquely on the right, to the walks of the Temple: and the eighth, obliquely on the left, to Curfitor's alley.

Passing down Fleet-street, at the bottom of which the ditch was to be rendered a beautiful canal, passable by as many bridges as there were streets to cross it, and leaving Ludgate-prison on the left side of the street, where a triumphal arch was to be formed, instead of the gate, in honour of king Charles II. the founder of the new city: St. Paul's was to be situated where it is at present, and surrounded by a triangular piazza.

On leaving that cathedral on the left, a straight street was to extend directly to the Tower, adorned all the way, at proper distances, with parish-churches; and leaving that edifice to the right, the other great branch was to lead to the Royal Exchange, which was to be

seated in the middle of a piazza, between two great streets; the one from Ludgate leading to the south front, and another from Holborn, through Newgate, and thence straight to the north front of the Exchange.

This noble scheme was demonstrated to be practicable, without the infringement of any man's property; for, by leaving out the church-yards, &c. which were to be removed out of town, there would have been sufficient room both for the augmentation of the streets, the disposition of the churches, halls, and all public buildings, and to have given every proprietor full satisfaction: for though few of them would have been seated upon exactly the very same ground they possessed before the fire, yet none would have been thrust at any considerable distance from it: but the obstinacy of great part of the citizens, in refusing to recede from the right of rebuilding their houses on the old foundations, was an unsurmountable obstacle to the execution of this noble scheme.

Soon after this, Sir John Evelyn produced another plan, in which he proposed, that some of the deepest vallies should be filled up, or at least made with less sudden declivities. That a new and spacious key should run from the Tower to the Temple, and extend itself as far as the low water mark; by which means the channel of the river would be kept constantly full; the irregularity and deformity of the stairs, and the dirt and nastiness left at every ebb would also be prevented.

To create variety in the streets, he also proposed, that there should be breaks and enlargements, by spacious openings at proper distances, surrounded with piazzas, and uniformly built with beautiful fronts; and that some of these openings should be square, some circular, and others oval. He would have none of the principal streets less than an hundred feet in breadth, nor any of the narrowest less than thirty. He would have three or four large streets between the Thames and London Wall, reckoning that of Cheapside for the chief, which might extend from Temple Bar to the upper part of Tower-hill, or to Crutched Friars, bearing the cathedral of St. Paul's upon a noble eminence.

Among these he would have the parochial churches, which he thought might be reduced to half the number, as some of the parishes were then no less than two hundred times larger than others: and these he would have so interspersed, as to adorn the profile of the city at all its avenues. Most of them he would have in the centre of spacious areas, adorned with piazzas, &c. so as to be seen from several streets, and others at the abutments and extremities of them.

About the church piazzas, the stationers and book-sellers were to have their shops, and the ministers their houses; as about that of St. Paul's was to be the episcopal palace, the dean and prebend's houses, St. Paul's school, a public library, the prerogative and first fruits office, all which were to be built at an ample distance from the cathedral, and with more stately fronts, in honour of that august pile. In some of these openings, surrounded with piazzas, he proposed to have the several markets. In others the coaches might wait; and in some might be public fountains constantly playing.

The College of Physicians he would have in one of the best parts of the town, incircled with a handsome piazza, for the dwellings of those learned persons, with the surgeons, apothecaries, and druggists in the streets about them; for he would have all of a mystery in the same quarters: those of the better sort of the shopkeepers in the sweetest and most eminent streets and piazzas; and the artificers in the more ordinary houses, in the intermediate and narrow passages; the taverns and victualling-houses were to be placed amongst them, and be built accordingly; but so as to preserve the most perfect uniformity.

Between the piazzas, market-places, and churches, might be placed the halls for the companies; and these, if fronted with stone, and adorned with statues and other ornaments, would infinitely enrich the streets, and render this city as famous for architecture of the most refined gusto, as any city in Europe; among which should be distinguished Guildhall, by its being more pompous and magnificent than the rest: near this edifice he would

have a magnificent house for the lord mayor, and others for the two sheriffs.

The Royal Exchange he thought might front the Thames about the Steelyard, in an area surrounded on three sides with piazzas, with vaults for warehouses underneath; and for such merchandize as could not be well preserved under ground, might be erected buildings fronting the Thames on the other side of the river, with wharfs before and yards behind for the placing of cranes, the laying of timber, coals, &c. and other gross commodities, while the key over against it should be built for the owners, and the dwellings of the principal merchants: but if the warehouses must needs be on this side, they should be made to front Thames-street rather than the river, because of the dull and heavy aspect of those buildings.

The little bay at Queenhithe should have the key continued around it, and cloistered about for the marketmen and fruiterers; and where the wharf then was, a stately avenue was to extend to St. Paul's.

Four great streets were to extend along the city: the first from Fleet-ditch, (which was to be formed into a noble canal) to the Tower: the second, from the Strand to the most eastern part of the city, where should be a noble triumphal arch in honour of Charles II. the third, from Newgate to Aldgate: and the fourth and shortest, from Aldergate to Bishopsgate. He proposed that five principal cross-streets should extend from Black Friars stairs into West Smithfield; from the Thames east of St. Paul's to Aldergate; from Queenhithe to Cripplegate; and from the Royal Exchange to Moorgate: that the street from the bridge should extend to Bishopsgate: that one from Billingsgate should extend near as far: and one from the Custom-house to Aldgate.

The hospitals, workhouses to employ the poor, and the prisons, being built and re-endowed at the public expence, were to be disposed of in convenient quarters of the city: the hospitals would become one of the principal streets; but the prisons, and court for the trial of criminals, might still be built near the entrances of the city.

The gates were to be in the form of triumphal arches, adorned with statues, relievos, and opposite inscriptions, not obstructed by sheds, or mean houses joined to them.

This gentleman also proposed, that along the wall betwixt Cripplegate and Aldgate, should be the churchyards of the several parishes, while the houses opposite to them formed a large street for the common inns, and served as a station for carriers, &c. These being on the north part of the city, and nearest the confines of the fields and roads, would least incumber the town; and there would be a far more commodious and free access to them, by reason of their immediate approaches through the traverse streets, than if they were scattered up and down without distinction.

But this scheme, which was designed as an improvement of Sir Christopher's, also fell to nothing; and by the obstinacy of the citizens, the opportunity was lost of rendering this city the admiration of the world, and thereby of drawing the nobility of all Europe to visit it, and lay out great sums here.

However, it was ordered by act of parliament, that many of the streets and lanes should be widened, and the city was impowered to make a new street from Cheapside to Guildhall, which obtained the name of King-street, and another from Threadneedle-street to Lothbury, called Prince's-street. And the markets, which till then were held in Newgate-street and Cheapside, were ordered to be removed behind the houses into commodious market-places to be prepared for that purpose. It was also enacted, that all the houses should be built with stone or brick, with party walls, and the whole finished within three years: that the ground in several places should be raised, and that a column of brass or stone should be erected on or near the place where the above dreadful fire began.

The streets, markets, churches, schools, halls, and other public buildings in this city and its liberties, are too numerous to be mentioned, much less to be described, within the bounds allotted to this article; so that the most remarkable only must be selected.

In Bridge-ward within, the principal structure is London-bridge, from which Bridge-ward within and Bridge-ward without were denominated. The original bridge was of wood, and appears to have been first built between the years 993 and 1016; but being burnt down about the year 1135, it was rebuilt of wood in 1163. The expences, however, of maintaining and repairing it, became so burdensome to the inhabitants of the city, that it was resolved to build a stone bridge a little westward of the wooden one. This building was begun in 1176, and finished in 1209. It consisted of twenty arches, was nine hundred and fifteen feet long, forty-four feet high, and seventy-three feet wide; but houses being built on each side, the street or interval between them was only twenty-three feet broad. The narrowness of this passage having occasioned the loss of many lives, from the number of carriages continually passing and repassing; and the straitness of the arches, and the enormous size of the sterlings, which took up one fourth part of the water-way, and rendered the fall at low water no less than five feet, having also occasioned frequent and fatal accidents, the magistrates of London, in 1756, obtained an act of parliament, for improving, widening and enlarging the passage over and through this bridge; which granted them a toll for every carriage and horse passing over it, and for every barge or vessel with goods passing through it: but these tolls being found insufficient, were abolished by an act, which passed in 1758, for explaining, amending, and rendering the former act more effectual, and for granting the city of London money towards carrying on that work. In consequence of these acts of parliament, a temporary wooden bridge was built, and the houses on the old bridge were taken down. Instead of a narrow street, twenty-three feet wide, there is now a passage of thirty-one feet for carriages, with a handsome raised pavement of stone on each side, seven feet broad, for the use of foot passengers. The sides are secured and adorned by fine stone balustrades, enlivened in the night with lamps. The passage through the bridge is enlarged, by throwing the two middle arches into one, and by several other alterations and improvements. But still the passage is very dangerous, and large banks of sand are thrown up, both above and below the bridge, by the violence of the current.

Under the first, second, and fourth arches, from the north side of the bridge, there are engines, worked by the flux and reflux of the river; the water of which they raise to such a height, as to supply many parts of the city. These engines were contrived, in 1582, by one Peter Morice, a Dutchman, and called London-bridge Water-works. The works under the fourth arch will be taken away as soon as an engine under the second arch can be finished, which is now in great forwardness.

Near the north side of London-bridge stands a beautiful and magnificent fluted column, of the Doric order, built with Portland stone, and called the Monument. It was erected to perpetuate the memory of a most dreadful fire that broke out near the place where it stands, upon the second of September, in the year 1666, and destroyed almost the whole of this city, whence it is called the Fire of London. This column, which was begun in 1671, and finished in 1677, is fifteen feet diameter, and two hundred and two feet high from the ground, the exact distance of the very spot from it, where the fire first broke out. It stands on a pedestal, forty feet high, and twenty-one feet square, adorned with emblems in alto and basso relievo: within it is a spiral stair-case of black marble, containing three hundred and forty-five steps, with iron rails, leading to a balcony, encompassing a cone, which is thirty-two feet high, and supports a blazing urn of brass gilt. It is observed of this column, that, like Trajan's pillar at Rome, it is built in form of a candle. There is an inscription upon this monument, purporting, that the fire was kindled and kept up by papists: this indeed is the fact it was built to commemorate; which, notwithstanding, has been less and less believed, as the spirit of party has decayed with ignorance and superstition; and

at present it is almost universally agreed to be false, the very inscription itself being fallacious and equivocal. It tells us, that two persons were executed upon the spot as incendiaries; and that they confessed; not that they set the house on fire where the conflagration began, but that the conflagration began at that house.

In Tower-ward, the most easterly ward of the city, is a tower, called the Tower of London, from which the ward took its name, and which anciently was a royal palace, but is now the chief fortress of the city. It stands near the Thames, and is supposed to have been originally built by William the Conqueror, about the year 1076, when it consisted of that part only called the White Tower, which was new built in 1637 and 1638.

The White Tower itself consists of three very lofty stories, under which are spacious and commodious vaults, chiefly filled with saltpetre. It is covered on the top with flat leads, from whence there is an extensive and delightful prospect.

In the first story are two noble rooms, one of which is a small armoury for the sea-service, it having various sorts of arms very curiously laid up, for above ten thousand seamen. In the other room are many closets and presses, all filled with warlike engines and instruments of death. Over this are two other floors, one principally filled with arms, the other with arms and other warlike instruments, as spades, shovels, pick-axes, and cheveaux de frize. In the upper story are kept match, sheep-skins, tanned hides, &c. and in a little room, called Julius Cæsar's Chapel, are deposited some records, containing perhaps the ancient usages and customs of the place. In this building are also preserved models of the new invented engines of destruction that have from time to time been presented to the government.

On the top of one of the towers is a large cistern or reservoir for supplying the whole garrison with water: it is about seven feet deep, nine broad, and about sixty in length, and is filled from the Thames by means of an engine very ingeniously contrived for that purpose.

Near the south-west angle of the White Tower is the Spanish armoury, in which are deposited the spoils of what was vainly called the Invincible Armada, in order to perpetuate to latest posterity the memory of that signal victory obtained by the English over the whole naval power of Spain in the reign of Philip II. which will ever render the glorious name of queen Elizabeth dear to Britons: for of one hundred and thirty-two ships that arrived in the British channel, scarce seventy of them returned home; and of thirty thousand men on board, upwards of twenty thousand were either killed, drowned, or made prisoners in England. Such was the fate of this vain-glorious enterprize!

You now come to the grand storehouse, a noble building to the northward of the White Tower, that extends two hundred and forty-five feet in length, and sixty in breadth. It was begun by king James II. who built it to the first floor; but it was finished by king William III. who erected that magnificent room called the New, or Small Armoury, in which that prince, with queen Mary his consort, dined in great form, having all the warrant workmen and labourers to attend them, dressed in white gloves and aprons, the usual badges of the order of masonry.

This structure is of brick and stone; and on the north side is a stately door-case, adorned with four columns, with their entablature and triangular pediment of the Doric order; and under the pediment are the king's arms, with enrichments of trophy work.

To the Small Armoury you are led by a folding door adjoining to the east end of the Tower chapel, which leads to a grand stair-case of fifty easy steps. On the left side of the uppermost landing-place is the workshop, in which are constantly employed about fourteen furbishers, in cleaning, repairing, and new-placing the arms.

On entering the armoury, you see what they call a wilderness of arms, so artfully disposed, that at one view you behold arms for near eighty thousand men, all bright, and fit for service at a moment's warning: a sight which it is impossible to behold without astonishment;

ment; and besides those exposed to view, there were, before the present war, sixteen chests set up, each chest holding about twelve hundred muskets. Of the disposition of the arms no adequate idea can be formed by description; but the following account may enable the spectator to view them to greater advantage, and help him to retain what he sees.

The arms were originally disposed in this manner by Mr. Harris, who contrived to place them in this beautiful order, both here and in the guard-chamber of Hampton Court. He was a common gunsmith, but after he had performed this work, which is the admiration of people of all nations, he was allowed a pension from the crown for his ingenuity.

The north and south walls are each adorned with eight pilasters, formed of pikes sixteen feet long, with capitals of the Corinthian order composed of pistols.

At the west end, on the left hand, as you enter, are two curious pyramids of pistols, standing upon crowns, globes, and sceptres, finely carved, and placed upon pedestals five feet high.

At the east, or farther end, in the opposite corner, are two suits of armour, one made for that warlike prince, Henry V. and the other for his son, Henry VI. over each of which is a semicircle of pistols: between these is represented an organ, the large pipes composed of brass blunderbusses, the small of pistols. On one side of the organ is the representation of a fiery serpent, the head and tail of carved work, and the body of pistols winding round in the form of a snake; and on the other an hydra, whose seven heads are artfully combined by links of pistols.

Upon the ground floor under the small armoury, is a large room of equal dimensions with that, supported by twenty pillars, all hung round with implements of war. This room, which is twenty-four feet high, has a passage in the middle sixteen feet wide.

At the sight of such a variety of the most dreadful engines of destruction, before whose thunder the most superb edifices, the noblest works of art, and numbers of the human species, fall together in one common undistinguished ruin, one cannot help wishing, that these horrible inventions had still lain, like a false conception, in the womb of nature, never to have been ripened into birth. But when, on the other hand, we consider, that with us they are not used to answer the purposes of ambition; but for self-defence, and in the protection of our just rights, our terror subsides, and we view these engines of devastation with a kind of solemn complacency, as the means providence has put into our hands for our preservation.

The Horse Armoury is a plain brick building a little to the eastward of the White Tower; and is an edifice rather convenient than elegant, where the spectator is entertained with a representation of those kings and heroes of our own nation with whose gallant actions it is to be supposed he is well acquainted: some of them equipped and sitting on horseback, in the same bright and shining armour they were used to wear when they performed those glorious actions that give them a distinguished place in the British annals.

In ascending the stair-case, just as you come to the landing-place, on casting your eye into the room, you see the figure of a grenadier in his accoutrements, as if upon duty, with his piece rested upon his arm; which is so well done, that at the first glance you will be apt to mistake it for real life.

When you enter the room, your conductor presents to your notice the figures of the horse and foot on your left hand, supposed to be drawn up in military order, to attend the kings on the other side of the house. These figures are as big as the life, and have been lately new painted.

You now come to the line of kings, which your conductor begins by reversing the order of chronology; so that in following them we must place the last first.

1. His late majesty king George I. in a complete suit of armour, sitting with a truncheon in his hand on a white horse richly caparisoned, having a fine Turkey bridle gilt, with a globe, crescent and star; velvet furniture laced with gold, and gold trappings.

2. King William III. dressed in the suit of armour worn by Edward the Black Prince, son to Edward III. at the glorious battle of Crécy. He is mounted on a sorrel horse, whose furniture is green velvet embroidered with silver, and holds in his right hand a flaming sword.

3. King Charles II. dressed in the armour worn by the champion of England at the coronation of his present majesty. He sits with a truncheon in his hand, on a fine horse richly caparisoned, with crimson velvet laced with gold.

4. King Charles I. in a rich suit of his own armour gilt, and curiously wrought, presented to him by the city of London when he was prince of Wales, and is the same that was laid on the coffin at the funeral procession of the late great duke of Marlborough, on which occasion a collar of SS was added to it, and is now round it.

5. James I. who sits on horseback dressed in a complete suit of figured armour, with a truncheon in his right hand.

6. King Edward VI. dressed in a curious suit of steel armour, whereon are depicted, in different compartments, a great variety of scripture histories. He sits, like the rest, on horseback, with a truncheon in his hand.

7. King Henry VIII. in his own armour, which is of polished steel, with the foliages gilt or inlaid with gold. He holds a sword in his right hand.

8. King Henry VII. who also holds a sword. He sits on horseback in a complete suit of armour finely wrought, and washed with silver.

9. King Edward V. who, with his brother Richard, was smothered in the Tower; and having been proclaimed king, but never crowned, a crown is hung over his head. He holds a lance in his right hand, and is dressed in a rich suit of armour.

10. King Edward IV. father to the two unhappy princes above-mentioned, is distinguished by a suit of bright armour studded. He holds a drawn sword in his hand.

11. King Henry VI. who, though crowned king of France at Paris, lost that kingdom, and was at last murdered in the Tower by the duke of Gloucester, afterwards Richard III.

12. The victorious Henry V. who, by his conquests in France, caused himself to be acknowledged regent, and presumptive heir to that kingdom.

13. Henry IV. the son of John of Gaunt.

14. King Edward III. John of Gaunt's father, and father to Edward the Black Prince, is represented here with a venerable beard, and in a suit of plain bright armour, with two crowns on his sword, alluding to his being crowned king both of France and England.

15. King Edward I. dressed in a very curious suit of gilt armour, and in shoes of mail. He has a battle-ax in his hand.

16. William the Conqueror, the first in the line, though last shewn, sits in a suit of plain armour.

17. Over the door where you go out of the armoury, is a target, on which are engraved, by a masterly hand, the figures, as it should seem, of Justice, Fortune, and Fortitude; and round the room the walls are everywhere lined with various uncommon pieces of old armour, for horses heads and breasts, targets, and many pieces that now want a name.

The Mint is an office kept in the Tower for coining money. Before the Norman conquest the kings of England set apart certain monasteries for Mints; presuming that the coinage would in those places be best secured from frauds and corruption. Edward I. however ordered a mint of thirty furnaces to be erected in the Tower of London, and others in Canterbury, Kingston upon Hull, Newcastle upon Tyne, Bristol and Exeter. From that time the mint was kept sometimes in one place, and sometimes in another, according to the will and pleasure of the prince, who, for a sum of money, was frequently prevailed upon to grant the privilege of coining to some nobleman, bishop, or corporation; which being attended with many inconveniencies to the public, queen Elizabeth, in the beginning of her reign, endeavoured

endeavoured to rectify those abuses, by confining the Mint to the Tower of London, which has ever since been appropriated to the coinage of money, except when king Charles I. by the confusion of the times, was obliged to erect new Mints at Oxford, York, and Newark upon Trent, where being with his army, he was reduced to the necessity of coining money to supply his present wants: and when king William III. having called in all the base and clipped money, for the sake of expedition, and for the service of distant parts of the nation, was obliged to erect Mints at Bristol, Exeter, York and Winchester.

The Mint Office is on the left hand on entering into the Tower, and at a small distance from the gate. There is no possibility of describing the particular processes that the different metals undergo before they receive the impression.

The manner of stamping is all you are permitted to see, and this is done with surprizing expedition, by means of an engine, worked sometimes by three, and sometimes by four men. The manner of making the impression on gold, silver, and copper, is exactly the same, only a little more care is necessary in the one, than the other, to prevent waste.

This engine, which makes the impression on both sides of a piece of money, in the same moment, works by a worm screw terminating in spindle; just in the same manner as the letter press for printing books. To the point of this spindle the head of the die is fastened by a small screw, and in a little sort of a cup directly underneath it, is placed the reverse. Between these the piece of metal already cut round, or cast to the size, and if gold, exactly weighed, is placed; and by once pulling down the spindle with a jerk, is completely stamped. The whole process is performed with amazing dexterity; for as fast as the men who work the engine can turn the spindle, so fast does another twitch out with his middle finger that which was stamped, while with his finger and thumb he places another that is unstamped. The silver and gold thus stamped, are delivered to be milled round the edges, the manner of performing which is a secret never shewn to any body.

The Mint is managed by several officers formed into a corporation. These are a warden, a master and worker, a comptroller, the king's assay master, the chief engraver, the surveyor of the meltings, a clerk of the issues, a weigher and teller, a provost, melters, blanchers, monyers, &c.

The Jewel office in the Tower, is a dark strong stone room, about twenty yards to the eastward of the grand storehouse or new armoury, in which the crown jewels are deposited. It is not certain whether they were always kept here, though they have been deposited in the Tower from very ancient times, and we have sufficient proof of their being in that fortress so early as the reign of king Henry III.

The jewels at this time shewn to all who chuse to give a shilling for seeing them, or eighteen pence for a company, are:

I. The imperial crown, with which it is pretended that all the kings of England have been crowned since Edward the Confessor, in 1042. It is of gold, enriched with diamonds, rubies, emeralds, sapphires and pearls: the cap within is of purple velvet, lined with white taffety, turned up with three rows of ermine. They are however mistaken in shewing this as the ancient imperial diadem of St. Edward; for that, with the other most ancient regalia of this kingdom, was kept in the arched room in the cloisters in Westminster Abbey, till the grand rebellion; when in 1642, Harry Martin, by order of the parliament, broke open the iron chest in which it was secured, took it thence, and sold it, together with the robes, sword, and sceptre of St. Edward. However after the restoration, king Charles II. had one made in imitation of it, which is that now shewn.

II. The golden orb or globe put into the king's right hand before he is crowned; and borne in his left with the sceptre in his right, upon his return into Westminster Hall, after he is crowned. It is about six inches in diameter, edged with pearl, and enriched with precious

stones. On the top is an amethyst, of a violet colour, near an inch and an half in height, set with a rich cross of gold, adorned with diamonds, pearls, and precious stones. The whole height of the ball and cup is eleven inches.

III. The golden sceptre, with its cross set upon a large amethyst of great value, garnished round with table diamonds. The handle of the sceptre is plain; but the pommel is set round with rubies, emeralds, and small diamonds. The top rises into a fleur de lis of six leaves, all enriched with precious stones, from whence issues a mound or ball made of the amethyst already mentioned. The cross is quite covered with precious stones.

IV. The sceptre with the dove, the emblem of peace, perched on the top of a small Jerusalem cross, finely ornamented with table diamonds and jewels of great value. This emblem was first used by Edward the Confessor, as appears by his seal; but the ancient sceptre and dove was sold with the rest of the regalia, and this now in the Tower was made after the restoration.

V. St. Edward's staff, four feet seven inches and an half in length, and three inches three quarters in circumference, all of beaten gold, which is carried before the king at the coronation.

VI. The rich crown of state worn by his majesty in parliament; in which is a large emerald seven inches round; a pearl esteemed the finest in the world, and a ruby of inestimable value.

VII. The crown belonging to his royal highness the prince of Wales.

These two last crowns, when his majesty goes in state to the Parliament house, are carried by the keeper of Jewel office, attended by the wardens, privately in a hackney coach to Whitehall, where they are delivered to the officers appointed to receive them, who with some yeomen of the guard carry them to the robing rooms adjoining to the house of lords, where his majesty and the prince of Wales put on their robes. The king wears this crown on his head while he sit upon the throne; but that of the prince of Wales is placed before him, to shew that he is not yet come to it. As soon as the king is disrobed, the two crowns are carried back to the Tower by the persons who brought them thence, and again locked up in the Jewel-office.

VIII. The late queen Mary's crown, globe and sceptre, with the diadem she wore at her coronation with her consort king William III.

IX. An ivory sceptre with a dove on the top, made for the late king James the second's queen, whose garniture is gold, and the dove on the top gold, enamelled with white.

X. The curtana, or sword of mercy, which has a blade thirty two inches long, and near two broad, is without a point, and is borne naked before the king at his coronation, between the two swords of justice, spiritual and temporal.

XI. The golden spurs, and the armillas, which are bracelets for the wrists. These, tho' very antique, are worn at the coronation.

XII. The ampulla or eagle of gold, finely engraved, which holds the holy oil the kings and queens of England are anointed with; and the golden spoon that the bishop pours the oil into. These are two pieces of great antiquity. The golden eagle, including the pedestal, is about nine inches high, and the wings expand about seven inches. The whole weighs about ten ounces. The head of the eagle screws off about the middle of the neck, which is made hallow, for holding the holy oil; and when the king is anointed by the bishop, the oil is poured into the spoon out of the bird's bill.

The following legend is told of this eagle. Thomas Becket being in disgrace at Sens in France, the holy Virgin appeared to him, and gave him a stone vessel of oil inclosed in a golden eagle, and bid him give it to William a monk, to carry to Pictavia, and there hide it under a great stone, in St. Gregory's church, where it should be found for the use of pious and prosperous kings: accordly Henry III. when duke of Lancaster, received it from a holy man in France; and Richard II. finding it among other jewels, endeavoured to be anointed with it; but was supplanted by Archibald Arundel,

who afterwards anointed Henry IV. Such is the fabulous history of the ampulla.

XIII. A rich salt-sealer of state, in form like the square White Tower, and so exquisitely wrought that the workmanship of modern times is in no degree equal to it. It is of gold, and used only on the king's table at the coronation.

XIV. A large silver font, double gilt, and elegantly wrought, in which the royal family are christened.

XV. A large silver fountain, presented to king Charles II. by the town of Plymouth, very curiously wrought; but much inferior in beauty to the above.

Besides these, which are commonly shewn, there are in the Jewel-office all the crown jewels worn by the prince and princesses at coronations, and a vast variety of curious old plate.

This office is governed by a master, who has four hundred and fifty pounds a year patent fees; two yeomen, who have one hundred and six pounds, fifteen shillings *per annum* each; a groom, who has one hundred and five pounds, eight shillings and four pence a year, and a clerk.

The principal officers of the Tower are, a constable, a lieutenant, and a deputy-lieutenant.

Belonging to the Tower there are eleven hamlets, the militia of which, consisting of four hundred men, are obliged, at the command of the constable of the Tower, to repair thither, and reinforce the garrison.

On Little Tower-hill is the Victualling-office, for furnishing his majesty's navy with victuals. It is separated from Tower-hill by a wall and gates, and contains houses for the officers, store-rooms, slaughter-houses, a brew-house, a salting-house and a barrelling-house, under the direction of seven commissioners, and other inferior officers.

Near Tower-hill is the Navy-office, where all affairs relating to the royal navy are managed by the commissioners under the lords of the admiralty. This is a very plain, but convenient building. The office where the commissioners meet, and the clerks keep their books, is detached from the rest, as a precaution against accidents by fire, the papers here being of the utmost importance. In the other part of the building, some of the commissioners, and other officers, reside.

In Toward-ward is also the Custom-house, erected for the receipt of his majesty's customs on goods imported and exported. It is a large, handsome, and commodious building situated on the bank of the Thames. In ancient times the business of the Custom-house was transacted in a more irregular manner at Billingsgate: but in the reign of queen Elizabeth a building was erected here for this purpose; for in the year 1559, an act being passed that goods should be no where landed, but in such places as were appointed by the commissioners of the revenue, this was the spot fixed upon for the entries in the port of London, and here a Custom-house was ordered to be erected; it was however destroyed by fire with the rest of the city in 1666, and was rebuilt with additions two years after by king Charles II. in a much more magnificent and commodious manner, at the expence of ten thousand pounds, but that being also destroyed in the same manner in 1718, the present structure was erected in its place.

This edifice is built with brick and stone, and is calculated to stand for ages. It has underneath and on each side, large warehouses for the reception of goods on the public account, and that side of the Thames for a great extent is filled with wharfs, keys, and cranes for landing them. The Custom-house is one hundred and eighty-nine feet in length: the center is twenty-seven feet deep, and the wings considerably more. The center stands back from the river; the wings approach much nearer to it, and the building is judiciously and handsomely decorated with the orders of architecture: under the wings is a colonade of the Tuscan order, and the upper story is ornamented with Ionic columns and pediments. It consists of two floors, in the uppermost of which is a magnificent room fifteen feet high, that runs almost the whole length of the building: this is called the Long-room, and here sit the commissioners of the

customs, with their officers and clerks. The inner part is well disposed, and sufficiently enlightened; and the entrances are so well contrived, as to answer the purposes of convenience.

It is observable that in the year 1590, the customs and subsidies in the port of London inwards, were let to farm to Mr. Thomas Smith, for twenty thousand pounds *per annum*, when it was discovered that they amounted annually to thirty thousand three hundred and nine pounds, so that queen Elizabeth lost every year ten thousand three hundred and nine pounds; but by the vast increase of commerce since that time, they at present bring in above an hundred times as much, the customs now annually amounting to above two millions; and yet this immense business is transacted with as much order and regularity, as the common affairs of a merchant's compting-house.

The government of the Custom-house is under the care of nine commissioners, who are entrusted with the whole management of all his majesty's customs in all the ports of England, the petty farms excepted, and also the oversight of all the officers belonging to them. Each of these commissioners has a salary of one thousand pounds a year; and both they, and several of the principal officers under them, hold their places by patent from the king. The other officers are appointed by warrant from the lords of the treasury.

Lime-street ward is remarkable for a very large building, of great antiquity, called Leadenhall, with flat battlements leaded on the top, and a spacious square in the middle. In this edifice are warehouses for the sale of leather, Colchester baize, meal, and wool. Adjoining to Leadenhall is a market, thence called Leadenhall Market, consisting of five considerable squares or courts, and reckoned one of the greatest markets in Europe for flesh and other provisions, also for leather, green hides, and wool.

In Broad-street ward was Gresham College, founded agreeable to the will of Sir Thomas Gresham, dated in July 1575, for lectures in divinity, astronomy, geometry, civil law, rhetoric, physic, and music. Here was a professor of each science, with a salary of fifty pounds *per annum*. The building was of brick, and is covered with slate, inclosing a court of one hundred and forty-four feet square. It had a large hall for the public lectures, and commodious apartments for the several professors. But it has long been complained, that this noble institution was infamously perverted, having been of late considered as a provision for obscure and necessitous persons, totally ignorant of their profession. The mayor and commonality of the city of London, together with the mercers company, are the trustees. The structure is now taken down, and a new office for the Excise erecting on the spot.

Near Gresham College, and in the same ward, is the Pay-office of the royal navy, under the direction of a treasurer and paymaster.

In this ward is also the Bank of England, a stone building, consisting of two quadrangles, begun in 1732, and finished in 1735. The principal front is about eighty feet in length, and is of the Ionic order, raised on a rustic basement, in a good stile. The top is adorned with a balustrade, and handsome vases. In the first or exterior court is the hall, which is of the Corinthian order, and is seventy-five feet long and forty broad: it is wainscotted about eight feet high, has a fine fret-work ceiling, and a statue of king William III. with a Latin inscription. On the east and west sides of the interior court, is an arcade; and on the north side is the accomptants office, which is sixty feet long, and twenty-eight broad. Over this office, and on the other sides, are handsome apartments, with a fine stair-case, adorned with fret-work: and under it are large strong vaults, with iron gates, for the preservation of the money. Very large additions have been lately made to this edifice, and a new street is opened before it, which shows the front to great advantage. The Bank is under the government of a governor, a deputy-governor, and twenty-four directors, established by act of parliament in 1693, by the title of the Governor and Company of the Bank of England.

The Royal Exchange, which is the burse or meeting-place of the merchants of London, stands in the ward of Cornhill, and is the finest and strongest fabric of the kind in Europe. It was first built of brick, in 1567, at the expence of Sir Thomas Gresham; and in 1570, was proclaimed the Royal Exchange, in a solemn manner, by herald with sound of trumpet, at the command, and in the presence of queen Elizabeth. That structure being destroyed by the fire of London in 1666, it was rebuilt of Portland stone, and rustic work, in a much more magnificent manner, as it now stands, at the expence of eighty thousand pounds. Of this building king Charles II. laid the first stone in 1667, and it was finished in 1669. The whole is a parallelogram, two hundred and three feet in length, and one hundred and seventy-one feet in breadth, inclosing an area one hundred and forty-four feet long, and one hundred and seventeen feet broad. This area is surrounded with piazzas, forming ambulatories for the merchants to shelter themselves from the weather. The area is paved with fine pebbles, and the ambulatories with black and white marble. Upon a marble pedestal, in the centre of the area, is a fine statue of king Charles II. in a Roman habit, set up at the charge of the merchant-adventurers, in 1684. Under the piazzas within the Exchange are twenty-eight niches, all vacant except two; one in the north-west angle, where is the statue of Sir Thomas Gresham; and the other at the south-west, in which is a statue of Sir John Barnard, a magistrate of exemplary virtues, who had twice been lord mayor of the city, and many years represented it in parliament. Above the arches of these piazzas is an entablature, with curious enrichments; and on the cornice a range of pilasters, with an entablature, extending round, and a compass pediment in the middle of the cornice of each of the four sides. In the inter-columns are twenty-four niches, nineteen of which are filled with the statues of the kings and queens of England, from king Edward I. to his present majesty, all adorned with the ensigns of royalty, except those of king Charles II. king James II. king George III. and king George II. which are habited like the emperors of Rome. In each of the two principal fronts of this building, on the south and north, is a piazza, and in the middle of each is an entrance into the area, under an arch, which is extremely costly and magnificent. On each side of the south entrance, in the inter-columns, is a niche, one containing a statue of king Charles I. and the other a statue of Charles II. both dressed in Roman habits, and well executed. Within the piazzas of these two fronts, are two spacious stair-cases, with iron rails, and black marble steps, which lead into a kind of gallery, that extends round the four sides of the building, in which were about two hundred shops, now mostly deserted. The height of this building is sixty-six feet; and from the centre of the south front rises a turret and lanthorn, one hundred and seventy-eight feet high, on the top of which is a fan in the form of a grasshopper, of polished brass, esteemed a fine piece of workmanship. The ground-floor of this building is taken up in shops and offices; and underneath the building are vaults, which are used by the East India company as warehouses for their pepper. In the area on the inside of the Royal Exchange, merchants of all nations meet every day at twelve o'clock at noon, and continue there to transact business till two, when the gates are shut, and not opened again till four.

South of the Royal Exchange, and near the south-west extremity of Lombard-street, is the general Post-office, which is a handsome and convenient building, under the direction of a post-master-general, a secretary, a receiver-general, accountant-general, and many other officers and servants; and the office of post-master-general is at present discharged by two commissioners.

In Walbrook-ward is the Mansion-house, for the residence of the lord mayor. It is built on a spot which was formerly a market for flesh and fish, called Stocks-market. The first stone of this building was laid in 1739, and it was finished in 1753. It is built of Portland stone, with a portico of six fluted columns of the

Corinthian order in the front. The basement story is very massy, and built in rustic work: in the centre of it is the door, which leads to the kitchens, cellars, and other offices: on each side rises a flight of steps, of very considerable extent, leading up to the portico; in the middle of which is a door leading to the apartments and offices, where business is transacted. The stone balustrade of the stairs is continued along the front of the portico, and the columns support a large angular pediment, adorned with a group of figures in bas-relief, representing the dignity and opulence of the city of London.

The building is an oblong, and its depth is the long side: the apartments are magnificent, but dark, the building being surrounded with houses; which also prevent its being seen to advantage from without.

Behind the Mansion-house is St. Stephen's church in Walbrook, justly reputed the master-piece of the celebrated Sir Christopher Wren, and said to exceed every modern structure in the world in proportion and elegance.

In Dowgate-ward is a famous academy called Merchant Taylors School, from its having been founded by the merchant taylor's company in the year 1561. It was burnt down by the fire of London in 1666, but was rebuilt, and is a very large structure, with commodious apartments for the masters and ushers, and a fine library of classic authors and historians. Sir Thomas White, lord mayor of this city, having founded St. John's college in Oxford, in 1557, appointed this school as a seminary for it; and established forty-six fellowships at Oxford, for scholars elected from this school.

The church of St. Mary le Bow, in Cordwainer-street ward, is the most eminent parochial church in the city. It was originally built in the reign of William the Conqueror; and being the first church the steeple of which was embellished with stone arches or bows, had its surname Le Bow from thence. It was destroyed in the fire of 1666, but was rebuilt, and in 1673 completed as it now stands. The steeple of this church is the most beautiful of its kind in Europe. An eminent author observes, that it is a master-piece in a peculiar kind of building, which has no fixed rules to direct it, nor is it to be reduced to any settled laws of beauty. If it be considered only as a part of some other building, it can be esteemed no other than a pleasing absurdity; but if considered either in itself, or as a decoration of a whole city, in prospect, it is not only to be justified, but admired. In this steeple is a ring of eight bells, of such deep notes, as to be easily distinguished from the peals of all the other churches in the city: one of these bells is indeed the largest of any in the city that is rung; and by an order of common council, made in 1469, it is rung every night at nine o'clock, pursuant to the direction of the donor, who is said to have been one Mr. Copeland, a taylor of London.

In Cheap-side-ward is Guildhall, or the town-house of London, for holding the courts, and transacting the business of the city. This hall was originally built in 1411, and was so damaged by the fire of 1666, as to be rebuilt in 1669. It is happily situated in view of one the most frequented thoroughfares in the whole city, and at the end of a pretty good vista, which shews the building in the most favourable manner; but at present the front of it has not much title to this advantage, as it is old and Gothic, and has no excellence, either of design or execution. The hall within is a very fine room, allowing for the taste in which it is built; it is one hundred and fifty-three feet long, fifty broad, and fifty-five high, and will hold near seven thousand persons. This hall is adorned with the arms of twenty-four of the companies of the city, with the city arms, the king's arms, the arms of king Edward the Confessor, and with the pictures of king William and queen Mary, queen Anne, king George I. king George II. and queen Caroline; king George III. and queen Charlotte; and the inter-columniations are adorned with the pictures of eighteen judges, put up here by the city as a testimony of public gratitude for their signal services, in determining the differences which arose between landlords and tenants, without the expence of law-suits, on rebuilding the city after the fire of London in 1666. In this hall hang a
great

great many of the colours and standards taken from the French at the battle of Ramillies.

In Baffishaw, or Biffinghall ward, is Blackwell or Bakewell-hall, which adjoins to Guildhall, and is the greatest mart of woollen cloth in the world. It was anciently called Basing-hall, from the residence of a family of the name of Basing, whose arms appear on several parts of it; and afterwards Bakewell-hall, from one Thomas Bakewell, its inhabitant in the reign of king Edward III. and of Bakewell-hall the present name is only a variation or corruption. It was purchased of king Richard II. by the city; and from that time has been employed as a weekly market for broad and narrow woollen cloths brought out of the country. It was burnt down in the fire of London, but rebuilt in 1672, and is now a spacious building, with a stone front, adorned with columns.

In the same ward is the Excise-office, a large brick building; the business of which is managed by nine commissioners, and other officers, who receive the produce of the excise due to the government, upon different commodities, throughout England, and pay it into the Exchequer; and before whom are tried all frauds committed in the several branches of the revenue under their direction. This office is intended to be removed, as soon as the new structure, now erecting on the site of Gresham-college, is finished.

Cripplegate-ward is remarkable for a college, called Sion-College, founded in 1627 by Dr. Thomas White, vicar of St. Dunstan's in the West, for the improvement of the London clergy, with alms-houses for twenty poor persons, ten men and ten women. In the year 1631, a charter was procured for incorporating the clergy of London, by which the several rectors, lecturers, vicars and curates of this city and suburbs, were constituted fellows of the college; and out of the incumbents are annually to be elected, on Tuesday three weeks after Easter, a president, two deacons, and four assistants, who are to meet quarterly to hear a Latin sermon, and afterwards to be entertained at dinner in the College-hall, at the expence of the foundation.

The building is of brick, and is extremely plain: it surrounds a square court, and consists of a handsome hall, lodgings for the president, and chambers for the students or expectants, who may lodge here till they are provided with houses in the several parishes where they serve cure. The alms-houses consist of twenty rooms; and here is a library well furnished with books, the private donations of several citizens and clergymen.

In this ward is a hall, which belonged to the company of barber-surgeons, the professions of barber and surgeon being formerly exercised by the same person. It was built by the celebrated Inigo Jones; and the theatre, where bodies were publicly dissected, and anatomical lectures read, is a very fine piece of architecture. This hall is now called Barbers Hall; for a few years ago, the surgeons disdaining to be associated with barbers, the two professions having been long distinct, obtained a separate charter, and built themselves a new hall in the Old Bailey, much inferior to that which they left in possession of the barbers, who could not be prevailed upon to relinquish it, though great part of it is to them entirely useless.

In Aldersgate ward is an edifice built with brick, and ornamented with stone, in a most noble and elegant taste, called the London Lying-in Hospital. It was originally known by the name of Shaftesbury-house, from having been the town residence of the earls of Shaftesbury, and was designed by the celebrated Inigo Jones: it contains thirty-three beds, and affords support, and every necessary accommodation and assistance for married women, in the last stage of their pregnancy, time of labour, and month of lying-in. This excellent charity is supported by voluntary contributions; and has proved a happy asylum to great numbers of worthy women in distressed circumstances.

Farringdon-ward within is distinguished by the most magnificent protestant church in the world, we mean the cathedral of St. Paul. It is said to have been originally founded in the year 610, by Ethelbert, a Saxon

king, on or near the place where a temple, dedicated to Diana, stood in the time of the Romans. It often suffered greatly by fire and lightning; but in the conflagration of 1666, it was totally destroyed. Soon after, Sir Christopher Wren was ordered to prepare a model for erecting a new structure; and a model was accordingly produced by that great artist, conformable to the best stile of the Greek and Roman architecture: but this having no similitude to the cathedral form, he was ordered to alter it. He did so, and produced the model from which the present structure was built, under his direction, and the first stone laid by himself on the twenty-first of June, 1675.

It is built of fine Portland stone in the form of a cross, and nearly in the manner of St. Peter's church at Rome. The walls are wrought in rustic, and strengthened as well as adorned by two rows of coupled pilasters, one over the other; the lower Corinthian, and the upper Composite. The spaces between the arches of the windows, and the architrave of the lower order, are filled with a great variety of curious enrichments, as are those above.

The west front is graced with a most magnificent portico, a noble pediment, and two stately turrets; and when one advances towards the church from Ludgate, the elegant construction of this front, the fine turrets over each corner, and the vast dome behind, fill the mind with a pleasing astonishment.

At this end, there is a noble flight of steps of black marble, that extend the whole length of the portico, which consists of twelve lofty Corinthian columns below, and eight of the Composite order above; these are all coupled and fluted. The upper series supports a noble pediment crowned with its acroteria. In this pediment is a very elegant representation in bas relief, of the conversion of St. Paul, which was executed by Mr. Bird, an artist, who, by this piece, has deserved to have his name transmitted to posterity. Nothing could have been conceived more difficult to represent in bas relief than this conversion; the most striking object being naturally the irradiation of light, but even this is well expressed, and the figures are excellently performed. The magnificent figure of St. Paul, also on the apex of the pediment, with St. Peter on his right and St. James on his left, have a fine effect. The four Evangelists with their proper emblems on the front of the towers, are also very judiciously disposed, and well executed: St. Matthew is distinguished by an angel; St. Mark, by a lion; St. Luke, by an ox; and St. John, by an eagle.

To the north portico, there is an ascent by twelve circular steps of black marble; and its dome is supported by six large Corinthian columns, forty-eight inches in diameter. Upon the dome is large and well proportioned urn, finely ornamented with festoons; and over this is a pediment supported by pilasters in the wall, in the face of which is the royal arms, with the regalia, supported by angels. And lest this view of the cathedral should appear void of sufficient ornament, the statues of five of the apostles are placed on the top at proper distances.

The south portico answers to the north, and is placed directed opposite to it. This, like the other, is a dome supported by six noble Corinthian columns: but, as the ground is considerably lower on this, than on the other side of the church, the ascent is by a flight of twenty-five steps. This portico has also a pediment above, in which is a Phoenix rising out of the flames with the motto RESURGAM underneath it, as an emblem of the rebuilding the church after the fire. This device had perhaps its origin from an incident, which happened at the beginning of the work, and was particularly remarked by the architect as a favourable omen. When Sir Christopher himself had set out upon the place the dimensions of the building, and fixed upon the center of the great dome, a common labourer was ordered to bring him a flat stone, the first he found among the rubbish, to leave as a mark of direction to the masons; the stone which the fellow brought for this purpose, happened to be a piece of a grave stone with nothing remaining of the inscription but this single word
in

in large capitals, RESURGAM; a circumstance which he never forgot. On this side of the building are likewise five statues, which take their situation from that of St. Andrew on the apex of the last mentioned pediment.

At the east end of the church is a sweep or circular projection for the altar, finely ornamented with the orders, and with sculpture, particularly a noble piece in honour of his majesty king William III.

The dome which rises in the center of the whole, appears extremely grand. Twenty feet above the roof of the church is a circular range of thirty-two columns, with niches placed exactly against others within. These are terminated by their entablature, which supports a handsome gallery adorned with a balustrade. Above these columns is a range of pilasters, with windows between; and from the entablature of these the diameter decreases very considerably; and two feet above that it is again contracted. From this part the external sweep of the dome begins, and the arches meet at fifty-two feet above. On the summit of the dome is an elegant balcony; and from its center rises the lanthorn adorned with Corinthian columns; and the whole is terminated by a ball, from which rises a cross, both elegantly gilt. These parts, which appear from below of a very moderate size, are extremely large.

This vast and noble fabric, which is two thousand two hundred and ninety-two feet in circumference, and three hundred and forty feet in height to the top of the cross, is surrounded at a proper distance by a dwarf stone wall, on which is placed the most magnificent balustrade of cast iron perhaps in the universe, of about five feet six inches in height, exclusive of the wall. In this stately enclosure are seven beautiful iron gates, which, together with the banisters, in number about two thousand five hundred, weigh two hundred tons and eighty-one pounds, which having cost six-pence per pound, the whole, with other charges, amounted to eleven thousand two hundred and two pounds and six-pence.

In the area of the grand west front, on a pedestal of excellent workmanship, stands a statue of queen Anne, formed of white marble with proper decorations. The figures on the base represent Britannia with her spear; Gallia, with a crown in her lap; Hibernia, with her harp; and America with her bow. These, and the colossal statues with which the church is adorned, were all done by the ingenious Mr. Hill, who was chiefly employed in the decorations.

The north east part of the church yard is conferred by the dean and chapter upon the inhabitants of St. Faith's parish, which is united to St. Austin's, for the interment of their dead; as is also the south east part of cemetery, with a vault therein, granted to St. Gregory's parish for the same use.

On ascending the steps at the west end, we find three doors ornamented on the top with bas relief; the middle door which is by far the largest, is cased with white marble, and over it is a fine piece of basso relievo, in which St. Paul is represented preaching to the Bereans. On entering this door, on the inside of which hang the colours taken from the French at Louisbourg in 1758, the mind is struck by the nobleness of the vista; an arcade supported by lofty and massy pillars on each hand, divide the church into the body and two isles, and the view is terminated by the altar at the extremity of the choir. The above pillars are adorned with columns and pilasters of the Corinthian and Composite orders, and the arches of the roof enriched with shields, festoons, chaplets and other ornaments.

In the isle on one hand is the confistory, and opposite to it on the other is the Morning prayer chapel, where divine service is performed every morning early, Sunday excepted: each of these have a very beautiful screen of carved waincot, that is admired by the best judges, and each are adorned with twelve columns, arched pediments and the royal arms finely decorated.

On proceeding forward, you come to the large cross isle between the north and south porticos; over which is the cupola. Here you have a view of the whispering gallery, of the paintings above it, and the concave, which fills the mind with surprize and pleasure. Under its cen-

tre is fixed in the floor a brass plate, round which the pavement is beautifully variegated; but the figures into which it is formed can no where be so well seen as from the whispering gallery.

You have now a full view of the organ, richly ornamented with carved work, with the entrance to the choir directly under it. The two isles on the sides of the choir, as well as the choir itself, are here enclosed with very fine iron rails and gates.

The Organ-gallery is supported by eight Corinthian columns of blue and white marble, and the Choir has on each side thirty stalls, besides the bishop's throne on the south side, and the lord Mayor's on the north. The carving of the beautiful range of stalls as well as that of the organ, is much admired.

Here the reader's desk, which is at some distance from the pulpit, is an enclosure of very fine brass rails gilt, in which is a gilt brass pillar supporting an eagle of brass gilt, which holds the book on his back and expanded wings.

The altar piece is adorned with four noble fluted pilasters painted and veined with gold in imitation of lapis lazuli, and their capitals are double gilt. In the inter-columiations are twenty-one panels of figured crimson velvet, and above them six windows, in two series.

The floor of the Choir, and indeed of the whole church, is paved with marble: but within the rails of the altar with porphyry, polished and laid in several geometrical figures.

But to be more particular: as the disposition of the vaultings within is an essential beauty, without which many other ornaments would lose their effect, so the architect was particularly careful in this respect. "The Romans, says the author of the Parentalia, used hemispherical vaultings, and Sir Christopher chose those as being demonstrably lighter than the diagonal cross vaults: so the whole vault of St. Paul's consists of twenty-four cupolas cut off semicircular, with segments to join to the great arches one way, and which are cut across the other, with elliptical cylinders to let in the upper lights of the nave; but in the isles the lesser cupolas are both ways cut in semicircular sections, and altogether make a graceful geometrical form, distinguished with circular wreaths which is the horizontal section of the cupola; for the hemisphere may be cut all manner of ways into circular sections; and the arches and wreaths being of stone carved, the spandrels between are of sound brick, invested with stucco of cockle-shell lime, which becomes as hard as Portland stone; and which having large planes between the stone ribs, are capable of the farther ornaments of painting, if required.

"Besides these twenty-four cupolas, there is a half cupola at the east, and the great cupola of one hundred and eight feet in diameter at the middle of the crossing of the great isles. In this the architect imitated the Pantheon at Rome, excepting that the upper order is there only umbratile, and distinguished by different coloured marbles; in St. Paul's it is extant out of the wall. The Pantheon is no higher within than its diameter; St. Peter's is two diameters; this shews too high, the other too low; St. Paul's is a mean proportion between both, which shews its concave every way, and is very lightsome by the windows of the upper order, which strike down the light thro' the great colonade that encircles the dome without, and serves for the abutment of the dome, which is brick of two bricks thick; but as it rises every way five feet high, has a course of excellent brick of eighteen inches long banding thro' the whole thickness; and moreover, to make it still more secure, it is surrounded with a vast chain of iron strongly linked together at every ten feet. This chain is let into a channel cut into the bandage of Portland stone, and defended from the weather by filling the groove with lead.

"The concave was turned upon a center; which was judged necessary to keep the work even and true, though a cupola might be built without a center; but it is observable that the center was laid without any standards from below to support; and as it was both

“centering and scaffolding, it remained for the use of the painter. Every story of this scaffolding being circular, and the ends of all the ledgers meeting as so many rings, and truly wrought, it supported itself. This machine was an original of the kind, and will be an useful project for the like work, to an architect hereafter.

“It was necessary to give a greater height than the cupola would gracefully allow within, though it is considerably above the roof of the church; yet the old church having before had a very lofty spire of timber and lead, the world expected that the new work should not, in this respect, fall short of the old; the architect was therefore obliged to comply with the humour of the age, and to raise another structure over the first cupola; and this was a cone of brick, so built as to support a stone lanthorn of an elegant figure, and ending in ornaments of copper gilt.

“As the whole church above the vaulting is covered with a substantial oaken roof, and lead, the most durable covering in our climate, so he covered and hid out of sight the brick cone, with another cupola of timber and lead; and between this and the cone, are easy stairs that ascend to the lanthorn. Here the spectator may have a view of such amazing contrivances, as are indeed astonishing. He forbore to make little luthern windows in the leaden cupola, as are done out of St. Peter's, because he had otherwise provided for light enough to the stairs from the lanthorn above, and round the pedestal of the same, which are now seen below; so that he only ribbed the outward cupola, which he thought less Gothic than to stick it full of such little lights in three stories, one above another, as is the cupola of St. Peter's, which could not, without difficulty, be mended, and, if neglected, would soon damage the timbers.”

As Sir Christopher was sensible, that paintings, though ever so excellent, are liable to decay, he intended to have beautified the inside of the cupola with mosaic work, which strikes the eye of the beholder with amazing lustre, and without the least decay of colours, is as durable as the building itself; but in this he was unhappily overruled, though he had undertaken to procure four of the most eminent artists in that profession from Italy; this part is however richly decorated and painted by Sir James Thornhill, who has represented the principal passages of St. Paul's life in eight compartments, viz. his conversion; his punishing Elymas, the forcerer, with blindness; his preaching at Athens; his curing the poor cripple at Lystra; and the reverence paid him there by the priests of Jupiter as a god; his conversion of the jailer; his preaching at Ephesus, and the burning of the magic books, in consequence of the miracles he wrought there; his trial before Agrippa; his shipwreck on the island of Melita, or Malta, with the miracle of the viper. These paintings are all seen to advantage by means of a circular opening, through which the light is transmitted, with admirable effect, from the lanthorn above.

The highest or last stone on the top of the lanthorn, was laid by Mr. Christopher Wren, the son of this great architect, in the year 1710; and thus was this noble fabric, lofty enough to be discerned at sea eastward, and at Windsor to the west, begun and completed in the space of thirty-five years, by one architect, the great Sir Christopher Wren; one principal mason, Mr. Strong; and under one bishop of London, Dr. Henry Compton: whereas St. Peter's at Rome, the only structure that can come in competition with it, continued an hundred and fifty-five years in building, under twelve successive architects; assisted by the police and interests of the Roman see; attended by the best artists of the world in sculpture, statuary, painting, and mosaic work; and facilitated by the ready acquisition of marble from the neighbouring quarries of Tivoli.

Besides very large contributions for carrying on this building, the parliament granted a duty upon sea-coal, which, at a medium, produced five thousand pounds *per annum*; and the whole expence in executing it is said to have amounted to seven hundred and thirty-six thousand,

seven hundred and fifty two pounds, two shillings and three-pence.

On the east side of the cathedral is St. Paul's school, founded in 1509 by Dr. John Collet, dean of this church, who endowed it for a principal master, an under-master, a chaplain, and one hundred and fifty-three scholars. He appointed the company of mercers trustees of it, and left eleven exhibitions, which the trustees apply to the use of such scholars as are sent to the universities, as they do others left to the school to the same purpose. The original building was consumed by the fire of London, and soon after, the present structure was raised. It is a very handsome edifice, built partly of stone, and ornamented with busts and carvings. Here is a good library of classic authors, the gift of the gentlemen that have been educated at this school.

In Warwick-lane, in this ward, stands the College of Physicians, erected in 1682 by Sir Christopher Wren. It is built of brick, with a spacious stone frontispiece, and is a beautiful and magnificent structure, but so surrounded with other buildings, that it can scarce be seen. Besides a hall, where two of the fellows of the college meet twice a week, to give advice and disperse medicines gratis to the poor, here is a committee-room, and a great hall, where all the members meet quarterly, adorned with paintings and sculptures. Here also is a theatre for anatomical dissections, a room for preparations, and conveniencies to dry herbs for the use of the dispensary. In the front of the hall, towards the court, is a good statue of king Charles II. cut in stone; another of Sir John Cutler, on the west side of the theatre; and in June 1739, a fine marble bust was erected in the great hall, in honour of the famous Dr. Harvey, at the expence of the late Dr. Mead, physician to his late majesty. Here also is a good library.

Near the south extremity of the Old Bailey, on the east side, is the hall built by the company of surgeons, with a theatre for dissection and lectures in anatomy.

In this ward, and adjoining to a church called Christ's Church, in Newgate-street, is Christ's Hospital, which, before the dissolution of monasteries by Henry VIII. was a house of Grey-friars. The hospital was founded by king Edward VI. for supporting and educating the fatherless children of poor freemen of this city, of which one thousand of both sexes are generally maintained in the house, or out at nurse, and are besides clothed and educated.

This hospital was opened in November 1552, when king Edward incorporated the mayor, commonalty and citizens of London, as governors of the estates of this, as well as of the other hospitals founded by him. In 1673; a mathematical school was founded here by king Charles II. and endowed with three hundred and seventy pounds a year; and a writing-school was erected here in 1694, by Sir John Moor, knight and alderman. After the boys have been seven or eight years on the foundation, some are sent to the university, others to sea; while the rest, about the age of eighteen years, are put apprentices to mechanic trades, at the charge of the hospital. Their habit was at first a russet cotton, but it was soon after changed for blue, which has continued ever since, and this foundation is on that account frequently called the Blue-coat Hospital. The affairs of this charity are managed by a president, and about three hundred governors, besides the lord mayor and aldermen, who appoint a treasurer, a register, and two clerks; a physician, a surgeon, steward, cook, porter, four beadles, a matron, and eleven nurses.

The building, which is partly Gothic, and partly modern, was much damaged by the fire in 1666, but was soon repaired, and has been since augmented with several new structures. The principal buildings, which form the four sides of an area, have a piazza round them, with Gothic arches, and the walls are supported by abutments. The front of the building is, however, more modern, and has Doric pilasters, supported on pedestals. An old cloister, which was part of the priory, is still standing.

In Castle Baynard ward is a spacious and commodious structure, called Doctors Commons. It consists of several

veral handsome paved courts, in which the judges of the court of admiralty, those of the court of delegates, of the court of arches and the prerogative court, with the doctors that plead causes, and the proctors that draw up the pleadings in these courts, all live in a collegiate way; and from communing together, as in other colleges, the name Doctors Commons was derived. This is a college for the study and practice of the civil law, where courts are kept for the trial of civil and ecclesiastical causes, under the archbishop of Canterbury and the bishop of London. Here is a fine library, in a most flourishing condition; for every bishop, at his consecration, gives twenty or fifty pounds towards purchasing books for it.

Near Doctors Commons, on St. Bennet's Hill, is the college of Heralds, who were incorporated by king Richard III. the chief officer of which is the earl marshal of England. Here are three kings at arms, Garter, Clarencieux, and Norroy, with six heralds, four pursuivants, and eight proctors. Garter attends the installation of knights of that order, carries the garter to foreign princes, regulates the ceremonies at coronations, and the funerals of the royal family and nobility; Clarencieux orders the ceremonies of the funerals of those under the degree of peers, south of Trent; and Norroy performs the like office for those north of Trent. This building was originally the palace of the earls of Derby, and falling to the crown, was given by Edward VI. in 1552, to the kings at arms, heralds, pursuivants, and their successors. It is a neat spacious quadrangle, built of brick, with convenient apartments, a good library relating to heraldry and antiquities, and a handsome court-room, where the earl marshal or his deputy hears causes that lie in the court of honour, and determines differences about arms, achievements, and titles. In this college are kept records of the coats of arms of all the families and names in England, when granted, and on what occasion.

In Farringdon-ward without, and at the extremity of the liberties of this city, westwards, there was anciently a row of posts, with rails, and a chain cross the street, called Temple Bar, from its situation, being contiguous to the Middle Temple, one of the inns of court: a wooden building was afterwards erected cross the street instead of the bar, with a narrow gateway; and in the year 1670, the present structure was erected, which is still called by the old name, Temple Bar. It resembles a triumphal arch, and is built entirely of Portland stone of the Corinthian order, with rustick work below: over the gateway, on the east side, in two niches, are stone statues of king James I. and his queen; and on the west side are the statues of king Charles I. and king Charles II. in Roman habits.

In this ward are several inns of court and chancery, particularly the Inner and Middle Temples, Serjeants Inn, Clifford's Inn, Thavy's Inn, Barnard's Inn, Staple's Inn, and Furnival's Inn.

The Temple was so called from its having been originally founded by the Knights Templars, who settled here in 1185. It was at first called the New Temple, by way of distinction from the Old Temple, or the first house of the Knights Templars, which stood in Holborn, over against Chancery-lane, and from which, on its becoming too small for them, they removed hither.

The original building was divided into three parts, the Inner, the Middle, and the Outward Temple: the Inner and the Outer Temple were so called, because one was within and one without the Bar, and the Middle Temple derived its name from its situation between them. After the dissolution of the order of Knights Templars, the New Temple fell to the Knights Hospitallers of St. John of Jerusalem, who granted a lease of it to the students of the common law, and converted that part of it called the Inner and Middle Temple, into two inns of court, for the study and practice of the common law; the Outer Temple became a house for the earl of Essex; and on the site of that house a street has been since built, called Essex-street.

The buildings of the Temple escaped the fire in 1666, but were most of them destroyed by subsequent fires,

and are now beautifully rebuilt of brick. The two Temples are each divided into several courts, and have a very pleasant garden on the bank of the Thames: they are appropriated to separate societies, and have separate halls, where the societies dine in common during term time. The Inner Temple hall is said to have been built in the reign of king Edward III. and the Middle Temple hall, which is a large magnificent edifice, was rebuilt in 1572, in form of a college-hall. The gate of the Middle Temple is remarkable for its noble front. Each society has a good library, adorned with paintings, and well furnished with books. An assembly, called a Parliament, in which the affairs of the society of the Inner Temple are managed, is held twice every term. Both Temples have one church, first founded in 1185, by the Knights Templars; but the present edifice is thought to have been built in 1240. It is one of the most beautiful Gothic structures in England, and is supported by neat slender pillars of Suffex marble. In this church are many ancient monuments, particularly of nine Knights Templars, cut in marble, in full proportion, some of them seven feet and a half long; six are cross-legged, and therefore supposed to have been engaged in one of those expeditions against the Turks, called Crusades. The minister of this church, who is usually called the Master of the Temple, is appointed by the benchers, or senior members of both societies, and presented by a patent from the crown.

Serjeants Inn is a small inn in Chancery-lane, where the judges and serjeants have chambers, but not houses, as they had in another inn of this name in Fleet-street, which they abandoned in 1730; but there is a hall and a chapel in each of them.

Clifford's Inn is an inn of chancery, belonging to the Inner Temple. It was a house granted originally by king Edward II. to the family of the Cliffords, from which it derived its name: it was afterwards leased to the students of the law; and in the reign of king Edward III. sold to the principals and fellows of this society.

Thavy's Inn is an inn of chancery, belonging to Lincoln's Inn, another inn of court: it stands near St. Andrew's church in Holborn, and was the house of Mr. John Thavy in the reign of Edward III. and by him, from whom it took its name, let out to the students of the law, who lived here before they had the Temple. It came afterwards to Mr. Gregory Nichols, a citizen and mercer of London, who sold it, in 1549, to the benchers of Lincoln's Inn, and their successors demised it to the principal and fellows of this house. This inn was lately rebuilt in a very handsome manner.

Barnard's Inn is an inn of chancery, belonging to Gray's Inn, another inn of court: it is situated also in Holborn, and was the house of John Mackworth, dean of Lincoln, who gave it to the professors of the law.

Staple's Inn belongs also to Gray's Inn, and stands in Holborn: it was once a hall for the merchants of the staple for wool, whence it had its name; but it was bought by the benchers of Gray's Inn, and has been an inn of chancery ever since the year 1415.

Furnival's Inn is an inn of chancery, belonging to Lincoln's Inn, and was once the house of the family of Furnivals, from which it derived its name. This family let it out to the professors of the law. It is a large handsome old building, and has a hall and a pleasant garden.

In a street in this ward, called the Old Bailey, there is a hall called Justice-hall, or the Sessions-house, where a court is held eight times a year by the king's commission of oyer and terminer, for the trial of criminals for offences committed within the city of London and county of Middlesex. The judges of this court are the lord mayor, the aldermen who have been lord mayors, and the recorder, who are attended by the sheriffs, and by one or more of the national judges. This hall is a plain brick edifice, that has nothing to recommend it.

In this ward is likewise a prison, called the Fleet Prison, from a small river called the Fleet which formerly run by it. This prison is very large, and reckoned the best in the city for good rooms and other conveniences:

niencies: it has the benefit of an open yard, which is enclosed with a very high wall: it is as ancient as the reign of Richard I. It belongs to the court of Common Pleas, and hither persons are committed for contempt of the courts of Chancery or Common Pleas, or for debt, when by writ of habeas corpus they remove themselves to it from any other prison.

In Chancery-lane, in this ward, is an office, consisting of a house and chapel, called the Office and Chapel of the Rolls, from being the great repository of the modern public rolls and records of the kingdom. This building was originally the house of an eminent Jew; but being forfeited to the crown, king Henry III. in the year 1223, converted it into an hospital for the reception and accommodation of Jewish and other proselytes. Edward III. in 1377, granted this hospital and its chapel to William Burfall, master of the rolls, to whose successors, in that office, it has belonged ever since. The mansion-house of the master of the rolls being much decayed, was lately rebuilt in a very magnificent manner, with hewn stone and brick.

The chapel is partly a Gothic structure, and here the rolls are kept in presses fixed to the sides of the chapel, and ornamented with columns and pilasters of the Ionic and Composite orders. In this chapel is a bench, where the master of the rolls hears causes in chancery, and here divine service is performed regularly. The records, when they become too voluminous for this chapel to contain, are removed to the office of the records in the Tower. There is a certain district round this office, consisting of about two hundred houses, which is called the Liberty of the Rolls, and over which the city has no authority, being under the government of the master of the Rolls.

In this ward is a large building, called Bridewell, from a spring formerly known by the name of St. Bridget's, or St. Bride's Well. It was originally a royal palace, and took up all the ground from Fleet-ditch on the east, to Water-lane on the west: part of it, now called Salisbury Court, was given to the bishops of Salisbury for their city mansion; and the east part, which was rebuilt by king Henry VIII. is that now called Bridewell. This palace king Edward VI. gave to the city for an hospital, which he endowed for the lodging of poor wayfaring people, and the correction of vagabonds, strumpets, and idle persons, and for finding them work. This edifice was burnt down in the fire of London, in 1666, but it was rebuilt in 1668, and is now a spacious and commodious structure, consisting of two courts, and having two fronts, one to the east, and another to the north, in each of which is a handsome gate. Here is also a chapel, and a hall for the court-room.

In one part of the building, twenty decayed artificers have houses; and about one hundred and fifty boys, distinguished by white hats and blue doublets, are put apprentices to glovers, flax-dressers, weavers, &c. and, when they have served their time, are entitled to the freedom of the city, and ten pounds each towards carrying on their respective trades. The other part of Bridewell is a prison, and a house of correction for disorderly servants, vagrants, and strumpets, who are made to beat hemp, and are kept at other hard labours. All the affairs of this hospital are managed by governors, who are above three hundred in number, besides the lord mayor and court of aldermen. The governors of this hospital are likewise governors of Bethlehem hospital, because these two hospitals are but one corporation; besides the same governors, they have the same president, clerk, physician, surgeon, and apothecary. This hospital, however, has its own steward, a porter, a matron, and four beadles.

Near Bridewell is St. Bride's Church, which was burnt down in 1666, but rebuilt in 1680. It is a stately fabric, one hundred and eleven feet long, fifty-seven broad, and forty-one high, with a most beautiful spire, two hundred and thirty-four feet in height, and a ring of no less than twelve bells in its tower.

By an act of parliament passed in 1756, the magistrates of the city of London have been empowered to erect a stone bridge across the river Thames, from Black Friars,

in this ward, to the opposite shore in the county of Surry: they are also authorized to fill up the channel of Fleet Ditch, and to purchase and remove such buildings, the removal of which shall be thought proper for forming and widening streets and avenues.

This bridge is to have a free passage through the arches, of seven hundred and fifty feet at least, within the banks of the river; a sufficient number of glass lamps are to be fixed up on proper parts of it, to burn from sun-setting to sun-rising, and a number of watchmen stationed upon it, for the security of passengers. It is to be built according to a plan invented by Mr. Robert Mylne, and the first stone of it was laid the thirtieth day of October 1760. Toward erecting and supporting this bridge, the magistrates of the city of London are to receive certain tolls from it, when finished; and upon the credit of these tolls, they are directed to raise any sum of money, not exceeding thirty thousand pounds, in one year, till they have raised one hundred and sixty thousand pounds in the whole, which they are not to exceed.

West Smithfield, in this ward, is an area containing three acres of ground, called in ancient records Smithfield Pond, or Horse Pool, it being formerly a watering-place for horses; but the pond being filled up, it became a green level field, said originally to have been called Smoothfield, of which Smithfield is a corruption. It was anciently the common place of execution; and at the south-west corner there was a gallows, called the Elms, from a number of elm-trees that then grew in the neighbourhood: it was also the place for public jousts, tournaments, and triumphs, and has been a market for cattle above five hundred years: it was paved at the request of king James I. and the market held on Mondays and Fridays, for black cattle, sheep, and horses, is now so much increased, that it is the greatest in Europe.

On the south side of Smithfield, in this ward, and contiguous to Christ's Hospital, is St. Bartholomew's Hospital. It was first founded in the second year of king Henry I. by Rahere, the king's jester, as an infirmary for the priory of St. Bartholomew the Great, which then stood near this spot; but upon the dissolution of religious houses, king Henry VIII. refounded it, and endowed it with five hundred merks a year, on condition that the citizens should pay the same annuity for the relief of one hundred lame and infirm patients; which was readily accepted, and the managers of the foundation were incorporated by the name of 'The mayor, commonalty, and citizens of London, governors of the hospital for the poor, called Little St. Bartholomew's, near West Smithfield.'

This charity afterwards received such large benefactions, that it now takes in the distressed of all countries. In 1702, a beautiful frontispiece was erected towards Smithfield, adorned with pilasters, entablature, and a pediment of the Ionic order, with a statue of king Henry VIII. standing in a niche in full proportion, and those of two cripples on the top of the pediment over the statue. In 1729, a plan was formed for rebuilding the rest of this hospital, and a magnificent edifice was erected by subscription, which was designed to be only one of four detached piles of buildings to be afterwards raised, about a court or area two hundred and fifty feet in length, and sixty feet in breadth. The original design is now entirely completed, and forms an elegant and superb building.

The governors of this charity are about three hundred; and the officers and servants are, a president, a treasurer, two physicians, five surgeons, an apothecary, a clerk; a matron, a porter, four beadles, a cook, and her servant, twenty sisters, twelve nurses, and twenty watchwomen. Those who have the immediate care of the hospital are the president, the treasurer, the auditors of the accounts, viewers of the revenues, overseers of the goods and utensils of the hospital, and the almoners or purveyors, who buy in the provisions and other necessaries. A committee, consisting of the treasurer, almoner, and some of the governors, meet twice a week to inspect the management of the house, discharge such persons as are cured, and admit others.

For the reception of such persons in the venereal disease, as might prove offensive to the rest, there are two infirmaries belonging to this hospital, called the Lock Hospitals, one of which was lately in Kent-street, Southwark; the other is at Kingsland, near Newington, a village on the north side of London.

Among many other privileges which king Henry I. granted to the prior and canons of the monastery of St. Bartholomew the Great, and to the poor of the infirmary, was that of keeping a fair in Smithfield on the eve, day, and morrow of St. Bartholomew.

This fair, called Bartholomew Fair, has been held annually ever since, and by the courtesy of the magistracy of London, to whom the privileges of keeping it devolved, upon the dissolution of the priory, it used to continue a fortnight: a great number of booths were erected in it by the principal actors of the theatres, for the exhibition of dramatic performances of various kinds; and it abounded with places where the rabble were seduced into gaming, by raffles, calculated for the unreasonable profit of the owners. It became at length so tumultuous and licentious a place, that Sir John Barnard, when he was lord mayor of London, reduced the time of the fair to its original duration of three days. This laudable example has been followed ever since; but booths still continued to be built, though for players of a lower class, and strolling companies from various parts: the fair, though short, was for the time a greater nuisance than before; and this year the magistrates of London very prudently prohibited all drolls, puppet-shows, and public exhibitions, which there is no reason to suppose will ever be renewed.

In Coleman-street ward, on the south side of a large square called Moorfields, stands the hospital of Bethlehem, founded in 1675 by the lord mayor and citizens of London, for the reception and cure of poor lunatics. It is a noble edifice, built with brick and stone, and adorned with pilasters, entablatures, carvings, and sculpture, particularly with the figures of two lunatics over the grand gate, which are well executed.

This building is five hundred and forty feet in length, forty feet in breadth, and was, not many years ago, augmented with two wings, by the charitable contribution of the citizens, for the reception of such lunatics as were deemed incurable. This hospital contains a great number of convenient cells or rooms, where the patients are taken care of and maintained without any charge to their friends, except bedding. The whole structure, on the inside, is divided into two stories, through each of which runs a long gallery, from one end of the house to the other: on the south side are the cells, and on the north the windows, that give light to the galleries, which are divided, in the middle, by handsome iron grates, to keep the men and women apart. Before the building, on the outside, is a pleasant garden, inclosed by an high wall, near seven hundred feet in length.

Bethlehem hospital being united to Bridewell hospital, both are managed by the same president, governors, treasurer, clerk, physician, surgeon, and apothecary; but each has a steward and inferior officers peculiar to itself.

But the hospital of Bethlehem being found incapable of receiving and providing for the relief of all the unhappy objects for whom application was made, a plain building was prepared for them on the north side of Moorfields, over against Bethlehem hospital: this is called St. Luke's Hospital, and is supported by private subscription. It is under the immediate inspection and government of its own patrons and supporters, and was opened for the admission of lunatics on the thirtieth of July 1751.

Besides the two markets already mentioned at Smithfield, for cattle and hay, and at Leadenhall for butchers meat, wool, hides, and Colchester baize, there are in this city the following other markets, which are all very considerable: Honey Lane, Newgate, and Fleet markets; principally for flesh, though with separate divisions for fish, butter, eggs, poultry, herbs and fruit; Billingsgate and Fish-street Hill markets, for fish only; and the Three Cranes market, for apples, and other fruit. The

two principal corn-markets are at Bear Key and Queenhithe; and at Billingsgate there is also a great market for coals.

The trade of this vast and opulent city is almost coeval with its foundation. Tacitus, in the sixty-third year of the christian æra, represents it as celebrated for its great commerce, and the number of its merchants; and Bede, in 604, testifies, that this metropolis had been long famous for being the mart of many nations, that traded hither by sea.

It appears from an estimate, that one fourth of the foreign trade of the nation is carried on at London; and it has been said, that the port of London pays two thirds of the customs of all England; but the vast commerce and wealth of London will perhaps best appear from a view of the incorporated societies or companies, as well of tradesmen as of merchants, in this city, and of the shipping that belongs to its port.

The companies of the city of London, or the several incorporations of its citizens, in their respective arts and mysteries, are in number ninety-one, besides several other companies or incorporated societies of merchants. Of these ninety-one companies, fifty-two have each a hall for transacting the business of the corporation, which consists of a master, or prime warden, a court of assistants, and livery. Every youth that serves an apprenticeship of seven years to a freeman of the city, becomes entitled to his freedom at the expiration of that time; and his name is then inrolled, not only at Guildhall, as a citizen, but in the books of the company to which his master belonged, as free of that particular corporation; and he becomes liable to pay a small sum quarterly for its use: he is then a yeoman of the company; and if he becomes considerable in business, he is chosen by the corporation a member of their body, and on public occasions is distinguished by a particular dress, a long black gown, faced with fur: this is the livery of the company, and he is hence called a Liveryman. From the livery are chosen the master, wardens, and court of assistants; also the clerk, beadle, and other officers. The sums of money yearly distributed in charity, by only twenty-three of the ninety-one, amount to twenty-three thousand, six hundred and fifty-five pounds, and the number of the liverymen belonging to all the companies are reckoned at eight thousand two hundred and seventeen.

Of these companies there are twelve which are superior to the rest, both in antiquity and wealth; and of one of these twelve, the lord mayors have generally made themselves free at their election, if they were not so before. These twelve companies are the Mercers, the Grocers, the Drapers, the Fish-mongers, the Goldsmiths, the Skinners, the Merchant Taylors, the Haberdashers, the Salters, the Iron-mongers, the Vintners, and Cloth-workers.

I. The Mercers company was incorporated by letters patent, granted by king Richard II. in 1393: it pays in charitable uses about three thousand pounds a year, and is governed by a prime, three other wardens, and forty assistants, with two hundred and thirty-two liverymen, each of which pays a fine only of two pounds thirteen shillings and four-pence upon his admission into the livery. Their hall is in Cheapside.

II. The Grocers company was anciently called Pepperers; but assuming the name of Grocers, it was incorporated under that denomination, by the letters patent of Edward III. which were confirmed by Henry VI. in 1429. These grants were confirmed by a new charter of Charles I. in 1640, with an additional power of searching and inspecting the goods and weights of all grocers within the city and suburbs of London, and three miles round. This corporation consists of a prime and three other wardens, fifty-two assistants, and one hundred and twenty-seven liverymen, whose fine, upon admission, is twenty pounds each. Their hall is in Grocers-alley, in the Poultry; and they have a great estate, out of which they pay to the poor about seven hundred pounds a year.

III. The company of Drapers was incorporated by Henry VI. in 1439, by the title of 'The master, war-

'dens, brethren and sisters of the guild or fraternity of the blessed Mary the Virgin, of the mystery of Drapers of the city of London.' This company is governed by a master, four wardens, and thirty assistants; and the number of members upon the livery are one hundred and forty, each of which, when admitted, pays a fine of twenty-five pounds. Their hall is in Throgmorton-street, and they pay to charitable uses about four thousand pounds a year.

IV. The Fish-mongers, as well as the other victuallers of this city, were anciently under the immediate direction of the lord mayor and court of aldermen, and consisted of two communities, the salt fish and stock-fishmongers. The salt-fishmongers were incorporated by Henry VI. in 1433, and the stock-fishmongers by Henry VIII. in 1509; but this division proving hurtful to the profession in general, they united, and were incorporated by letters patent of the twenty-eighth of Henry VIII. in 1536, by the name and title of the Wardens and Commonalty of the mystery of fishmongers of the city of London. This corporation consists of a prime and five other wardens, twenty-eight assistants, and one hundred and forty liverymen, who, when admitted, pay each a fine of thirteen pounds six shillings and eight-pence. Their hall is in Thames-street, and they pay to charitable uses about eight hundred pounds *per annum*.

V. The company of Goldsmiths appears to be of great antiquity; for in 1180, the twenty-sixth of Henry II. it was, among other guilds, amerced for setting up without the king's special licence. King Edward III. in consideration of the sum of ten merks, incorporated this company in 1327, with a privilege of purchasing in mortmain an estate of twenty pounds *per annum*. This grant was confirmed by Richard II. in 1394; and Edward IV. in 1462, invested the corporation with a privilege of inspecting, trying, and regulating all gold and silver wares, not only in this city, but in all other parts of the kingdom, with a power to punish all offenders concerned in working adulterated gold or silver, and a privilege of making bye-laws for their better government. This company is governed by a prime, three other wardens, and ninety-eight assistants, with one hundred and ninety-eight liverymen, each of which pays twenty pounds for admission. Their hall is in Foster Lane; and they have a very great estate, out of which is annually paid to charitable uses above one thousand pounds.

VI. The company of Skinners was incorporated by letters patent of the first of Edward III. in 1327, by the name of 'The master and warden of the guild or fraternity of the body of Christ, of the skinners of London.' This company consists of a master, four wardens, sixty assistants, and one hundred and thirty-seven liverymen, who pay each, upon being admitted, a fine of fifteen pounds. Their hall is on Dowgate-Hill; and they have a very large estate, out of which they pay annually to charitable uses about seven hundred pounds.

VII. The society of Merchant Taylors was anciently denominated Taylors and Linen-armourers, and incorporated by letters patent of the fifth year of Edward IV. in 1456; but many of the members of the company being great merchants, and Henry VII. a member of it, that prince, in 1503, the eighteenth year of his reign, incorporated the company a second time, by the name of 'The master and wardens of the merchant-taylors of the fraternity of St. John the Baptist, in the city of London.' This company is governed by a master, four wardens, thirty-eight assistants, and three hundred and ninety-four liverymen, each of which pays twenty pounds upon admission. Their hall is in Threadneedle-street; and they pay to charitable uses about two thousand pounds a year.

VIII. The company of Haberdashers was incorporated by letters patent of the twenty-sixth of Henry VI. in 1407, by the title of the fraternity of St. Catharine the Virgin, of the haberdashers of the city of London. This corporation is governed by a master, four wardens, ninety-three assistants, and three hundred and forty-two liverymen, who, upon their admission, pay

each a fine of twenty-five pounds. Their hall is in Maiden Lane; and they have a large estate, out of which they pay to charitable uses about three thousand five hundred pounds a year.

IX. The company of Salters appears to be of considerable antiquity, by a grant of a livery from Richard II. in 1394; but the fraternity was first incorporated by Elizabeth, in 1558, the first year of her reign. The company is governed by a master, two wardens, twenty-seven assistants, and one hundred and ninety liverymen, whose fine, upon admission, is twenty pounds each. Their hall is in Swithins Lane; and they have a very considerable estate, out of which they pay to charitable uses about five hundred pounds *per annum*.

X. The Iron-mongers company was incorporated in 1464, the third of Edward IV. and is governed by a master, two wardens, and eighty-four liverymen, who are all assistants, and pay each, upon admission, a fine of fifteen pounds. Their hall is in Fenchurch-street; and they have a large estate, out of which is paid to charitable uses about one thousand eight hundred pounds a year. Mr. Betton, a Turkey merchant, in 1724, left twenty-six thousand pounds to this company in trust, to employ one moiety of the profits for ever in the ransom of British captives from Barbary, and the other moiety in relieving the poor of the company, and supporting the charity-schools in the city and liberties.

XI. The company of Vintners was anciently denominated Merchant Wine-tunners of Gascoyne, and consisted of two kinds of dealers, the Venetians, who were the merchants or importers; and the Tabernarii, who were the retailers, and kept either taverns or cellars. This company was incorporated by letters patent the fifteenth of Henry VI. in 1437, and is governed by a master, three wardens, twenty-eight assistants, and one hundred and ninety-four liverymen; each of which, upon their admission, pays a fine of thirty-one pounds, thirteen shillings and four-pence. Their hall is in Thames-street; and they have a very considerable estate, out of which they pay yearly to charitable uses about six hundred pounds.

XII. The company of Cloth-workers was first incorporated by Edward IV. in 1482, by the name of 'The fraternity of the Assumption of the blessed Virgin Mary, of the sheermen of London;' but it was incorporated a second time, by queen Elizabeth, by the name of the master, wardens, and commonalty of the freemen of the art and mystery of cloth-workers of the city of London: Elizabeth's charter was confirmed by Charles I. in 1634. This corporation is governed by a master, four wardens, thirty-three assistants, and one hundred and fifty-four liverymen; each of whom, upon their admission, pays a fine of twenty pounds. Their hall is in Mincing Lane; and they have a very large estate, out of which is annually paid to charitable uses about one thousand four hundred pounds.

The principal incorporated societies of the merchants of this city are, the Hamburg company, the Hudson's Bay company, the Russia company, the Turkey company, the East-India company, the Royal African company, the South Sea company, and some insurance companies.

I. The Hamburg company was originally styled the merchants of the staple, and afterwards merchant adventurers. They were first incorporated by king Edward I. and by leave of the duke of Brabant, made Antwerp their staple or mart for the Low Countries; but Edward III. removed their staple, first to Calais, in his French territories, and then to several great towns in England. Queen Elizabeth enlarged the trade of this company, and impowered its members to treat with the princes and states of Germany, for a proper place for their staple, which was at length fixed at Hamburg, where they obtained the name of the Hamburg company. They have a governor, a deputy-governor, and a fellowship, or court of assistants.

II. The Hudson's Bay company, incorporated by Charles II. in 1670, carry on a considerable trade to all places within Hudson's Straits and Bay, where they have several factories, to which the natives bring their furs,

furs, skins, and other commodities, in exchange for the commodities of England. This corporation is governed by a governor, a deputy-governor, and seven assistants, and has a handsome hall in Fenchurch-street, built of brick.

III. The Russia company was first incorporated by queen Mary in 1555, and not only impowered to carry on an exclusive trade to all parts of the Russian empire, but to all such countries as they should discover in those northern parts: their privileges were confirmed by parliament, and enlarged by king James I. in 1614. The affairs of the company are managed by a governor, four consuls, and four and twenty assistants.

IV. The Turkey or Levant company was first incorporated by queen Elizabeth, in 1579; and its privileges were augmented and confirmed by king James I. who impowered the members to trade to all parts of the Levant. The affairs of this company are managed by a governor, a deputy-governor, and eighteen assistants.

V. The East-India company was first incorporated by queen Elizabeth, in 1601; but Oliver Cromwell, in the beginning of his usurpation, laid open the trade, upon a supposition, that it would be of advantage to the nation; but in 1657, the separate trade having proved fatal to the undertakers, they were, for the good of the whole, united to the company by the legislature. In the year 1698, a new East-India company was established by act of parliament, by virtue of which the old company was to have been dissolved after the expiration of a certain term; but by the good offices of friends to both, and for their mutual interests, the two companies were joined in 1702, and have ever since been stiled the united company of merchants trading to the East-Indies. They have a governor, a deputy-governor, and twenty-four directors, chosen annually. They have a house in Leadenhall-street, which was rebuilt in 1726, and is a spacious, handsome, and very convenient structure.

VI. The Royal African company was first incorporated in 1588, by queen Elizabeth, for trading to the African coast. It was incorporated a second time by king Charles II. with an exclusive power to trade all along the coast of Africa, from the port of Sallee, in South Barbary, to the Cape of Good Hope, during one thousand years. Upon this, the company erected and settled several forts and factories; but the trade being laid open by parliament in 1697, the company was disabled from supporting them. For this reason it was enacted, that all private traders to Africa should pay the company ten pounds per cent. for that purpose; but the sum produced was so deficient, that in 1730 the parliament found it necessary to grant one hundred thousand pounds for keeping up the fortresses, which sum has ever since been occasionally continued by parliamentary grants. The affairs of this company are managed by a governor, a sub-governor, a deputy, and thirty-six directors.

VII. The South Sea company was incorporated by act of parliament in the year 1710, the ninth of queen Anne, in consideration of its paying off a debt of nine millions, one hundred and seventy-seven thousand, nine hundred and sixty-seven pounds, fifteen shillings and four-pence, due from the government, and not provided for by parliament. It was intended for carrying on a trade to the South-sea, and for the encouragement of the fishery; and by another act the following year, after the discharge of the debt due to the company from the government, it was made perpetual. In the year 1714, the capital of the company, upon lending the government an additional sum of eight hundred and twenty-two thousand and thirty-two pounds, four shillings and eight-pence, was enlarged by act of parliament to ten millions, for which the members received interest at six per cent. In the year 1720, an act of parliament passed to enable the company to increase their capital, by redeeming several of the public debts, and to raise money for the discharge of sundry national incumbrances. By the several arts used on this occasion, the capital stock of the company was increased, by subscriptions, to thirty-three million, five hundred and forty-three thousand, two hundred and sixty-three pounds, eight shillings and three-pence. The company has a governor, sub-go-

vernor, and thirty directors; and the house, which is the best of the kind in London, is a spacious building, of stone and brick, and stands between Threadneedle-street and Broad-street.

There are two incorporated companies which insure ships at sea, both established in the reign of king George I: one is called the Royal Exchange Insurance company, whose office is kept in a part of that building; and the other is the London Insurance company, whose office is kept in Cornhill, near the Royal Exchange.

There are also several offices established in this city for insuring houses and goods from fire: these offices keep a number of servants in constant pay, to assist in quenching fires; these servants are called fire-men, and are distinguished by silver badges, with the arms of the offices to which they belong; and that water may never be wanting, the large wooden subterraneous pipes, that supply the city with water from the Thames and the New River, are perforated at proper distances, and stopped with a plug, which is called a fire-plug; and which, being drawn out, immediately lets the water into the street by a copious stream, which issues with such force, that it rises near a foot, in a jet not less than four inches diameter. Of these plugs the parish-officers keep the keys; and that every one may know where they are, the two letters F. P. are painted in large black characters on a white ground, in some conspicuous part of the house that stands next them.

There are also several offices for the insurance of lives, where, in consideration of a small annual sum paid during the life of a certain person, a considerable sum is paid at such person's death.

By a list of the ships that belonged to this city in the year 1732, taken from the general register at the custom-house, it appears, that the total number of vessels was fourteen hundred and seventeen, and of the men employed to navigate them, twenty-one thousand seven hundred and ninety-seven: it also appears, that from Christmas 1727 to Christmas 1728, the number of British ships that arrived in London from ports beyond the sea, amounted to one thousand eight hundred and thirty-nine; of foreign ships, two hundred and thirteen; of coasters, six thousand eight hundred and thirty-seven; and in the whole, eight thousand eight hundred and eighty-nine; and yet, prodigious as this number is, it has greatly increased.

Westminster, the second division of this vast metropolis, derives its name from a minster or abbey, called Westminster, on account of its situation in respect of St. Paul's cathedral in the city of London, which was formerly called Eastminster.

That district, which anciently included the city of Westminster, stands at the distance of one mile westward of the city of London, and contains only two parishes, those of St. Margaret and St. John, besides two chapels of ease. It forms a triangle, of which one side extends along the Thames, from Whitehall to Millbank, another from Millbank to the west end of a park called St. James's Park, and the third from the west end of the park to Whitehall, the whole being about two miles in circumference.

The city of Westminster, by an act of parliament passed in the twenty-seventh year of queen Elizabeth, is governed by a high steward, an officer of great state and dignity, who is commonly one of the first peers of the realm, and is chosen for life by the dean and chapter of a collegiate church in this city, dedicated to St. Peter, and called the abbey church; an under steward, who likewise holds his office for life, is nominated by the high steward, and confirmed by the dean; and an high bailiff, whose office is also for life, named by the dean and chapter, and confirmed by the high steward. Besides these officers, here are sixteen burgesses and as many assistants, and a high constable, chosen by the burgesses at the court-leet, which is held by the high steward or his deputy. Out of the sixteen burgesses two chief burgesses are chosen, one for each of two precincts, into which Westminster is divided. The high steward, or his deputy, presides as chairman at the quarter sessions of this city and its liberties. The high bailiff is a per-

son always supposed to be conversant in the law; he has the power of a sheriff, summons juries, presides over all the bailiffs of this city and liberties, superintends elections; for members of parliament, and sits next the under steward in court, where he receives all the fines and forfeitures to his own use: the two chief burgessees sit next him. Other inferior officers are, a town-clerk, an assessor, and a crier.

The dean and chapter are invested with an ecclesiastical and civil jurisdiction within the liberties of Westminster, St. Martin's le Grand, near Cheapside, in the city of London, and some towns in Essex, which are exempted both from the jurisdiction of the bishop of London, and archbishop of Canterbury.

In queen Elizabeth's time, Westminster had but four parish-churches, St. Margaret's, St. Martin's in the Fields, the Savoy church, and St. Clement's Danes; but now, besides the two parish-churches of St. Margaret and St. John, the original district of the city, it has seven churches, St. Clement's Danes, St. Paul's, Covent-Garden, St. Mary's le Strand, St. Martin's in the Fields, St. Anne's, St. James's, and St. George's, Hanover-square.

The most remarkable structure in Westminster is the abbey-church of St. Peter, built by Sebert, king of the East Saxons, in the year 616, on the foundations of the temple of Apollo. It was consecrated by Melitus, bishop of London, and dedicated to St. Peter.

This church and its monastery were afterwards repaired and enlarged by Offa, king of Mercia; but being destroyed by the Pagan Danes, they were rebuilt by king Edgar, who endowed them with lands and manors, and in the year 969, granted them many ample privileges.

The church and monastery having again suffered by the ravages of the Danes, were again rebuilt by Edward the Confessor, who pulled down the old church, and erected a most magnificent one, for that age, in its room, in the form of a cross, which afterwards became a pattern for that kind of building. The work being finished in the year 1065, he caused it to be consecrated with the greatest pomp and solemnity, and by several charters not only confirmed all its ancient rights and privileges, but endowed it with many rich manors, and additional immunities: ordained, that all its lands and possessions should be subject to none but its own jurisdiction, and the convent be free from the authority of the bishop of London; and the church, by a bull of pope Nicholas I. was constituted the place for the inauguration of the kings of England. In short, he gave it a charter of sanctuary, in which he declares, that any person whatsoever, let his crimes be ever so great, who takes sanctuary in that holy place, shall be assured of life, liberty, and limbs, and that none of his ministers, nor those of his successors, should seize any of his goods, lands or possessions, under pain of everlasting damnation, and that whoever presumed to act contrary to this grant, should lose his name, worship, dignity, and power, and with the traitor Judas, be in the everlasting fire of hell. This was the pious language of St. Edward the Confessor, and from this charter, Westminster-abbey became an asylum for traitors, murderers, robbers, and the most abandoned miscreants, who lived there in open defiance of the laws.

This, and king Edward's other charters, in which he recites the ridiculous story of its consecration by St. Peter, its destruction by the Danes, the grants and privileges of his predecessors, and those bestowed by himself, drew people thither from all parts, so that in a short time there was not sufficient room in the abbey church for the accommodation of the numerous inhabitants, without incommoding the monks; he therefore caused a church to be erected on the north side of the monastery, for the use of the inhabitants, and dedicated it to St. Margaret.

William the Conqueror, to shew his regard to the memory of his late friend king Edward, no sooner arrived in London, than he repaired to this church, and offered a sumptuous pall, as a covering for his tomb: he also gave fifty marks of silver, together with a very rich altar-cloth, and two caskets of gold; and the

Christmas following, was solemnly crowned there, his being the first coronation performed in that place.

The next prince who improved this great work, was Henry III. who in the year 1200 began to erect a new chapel to the blessed Virgin; but about twenty years after, finding the walls and steeple of the old-structure much decayed, he pulled them all down, with a design to enlarge, and rebuild them in a more regular manner; but he did not live to accomplish this great work, which was not completed till 1285, about fourteen years after his decease. And this is the date of the building as it now stands.

About the year 1502, king Henry VII. began that magnificent structure, which is now generally called by his name; for this purpose, he pulled down the chapel of Henry III. already mentioned, and an adjoining house called the White Rose Tavern. This chapel, like the former, he dedicated to the blessed Virgin, and designing it for a burial-place for himself and his posterity, he carefully ordered in his will, that none but those of royal blood should be permitted to lie there.

At length, on the general suppression of religious houses, the abbey was surrendered to Henry VIII. by William Benson, the abbot, and seventeen of the monks, in the year 1539, when its revenues amounted to three thousand nine hundred and seventy seven pounds, six shillings and four-pence three farthings *per annum*, a sum at least equal to twenty thousand pounds a year at present. Besides its furniture, which was of inestimable value, it had, in different parts of the kingdom, no less than two hundred and sixteen manors, seventeen hamlets, and ninety-seven towns and villages. And though the abbey was only the second in rank, yet in all other respects it was the chief in the kingdom; and its abbots having episcopal jurisdiction, had a seat in the House of Lords.

The abbey thus dissolved, that prince erected first into a college of secular canons, under the government of a dean, an honour which he chose to confer on the last abbot. This establishment, however, was of no long duration; for two years after, he converted it into a bishoprick, which was dissolved; nine years after, by Edward VI. who restored the government by a dean, which continued till Mary's accession to the crown; when she, in 1557, restored it to its ancient conventual state; but queen Elizabeth again ejected the monks, and in 1560, erected Westminster Abbey into a college, under the government of a dean, and twelve secular canons or prebendaries, a schoolmaster, usher, and forty scholars, denominated the Queen's, to be educated in the liberal sciences preparatory to the university, and to have all the necessaries of life, except cloathing, of which they were to have only a gown every year. To this foundation also belong choristers, singing-men, an organist, twelve alms-men, &c.

The abbey-church, which was stripped of many of its decorations by Henry VIII. and was much damaged, both within and without, during the unhappy civil commotions that defaced the ancient beauty of most of the religious houses in this kingdom, has continued from the death of Henry VII. almost to the present time, without any other considerable repairs, and was gradually falling to ruin, when the parliament interposed, and ordered a thorough reparation at the national expence.

This venerable fabric has been accordingly new coated on the outside, except that part called Henry VIII.'s Chapel, which is indeed a separate building: and the west end has been adorned with two new stately towers that have been lately rebuilt, in such a manner as to be thought equal, in point of workmanship, to any part of the ancient building: but though such pains have been taken in the coating, to preserve the ancient Gothic grandeur, that this church, in its distant prospect, has all the venerable majesty of its former state, yet the beautiful carving with which it was once adorned, is irretrievably lost; the buttresses, once capped with turrets, are now made in plain pyramidal forms, and topped with free-stone; and the statues of our ancient kings, that formerly stood in niches, near the tops of those buttresses, are, for the most part, removed, and their

broken

broken fragments lodged in the roof of Henry VII.'s chapel. Three of these statues are still standing next the towers on the north side, and indeed that is the only side where you can take a view of the abbey, the other side being so incumbered with buildings, that even its situation cannot be distinguished.

What, next to the new towers, principally engages the attention on the outside, is the Gothic portico which leads into the north cross, which by some has been stiled the Beautiful, or Solomon's Gate. This was probably built by Richard II. as his arms, carved in stone, were formerly over the gate. It has been lately beautified, and over it is a new window, admirably well executed. Besides these, there is little in the outward appearance capable of engaging the attention, and its principal beauties are to be found within.

The author of the work entitled English Architecture, seems to prefer the Gothic to the Grecian architecture, as most suited to the purposes of devotion, and gives this edifice as an instance. "There is in it (says he) "a majesty and grandeur, a sedate, and, if we may so "speak, religious dignity, which immediately strikes "the imagination, and never failed to impress on the "most insensible observer that holy awe which should "attend, and which always disposes the mind to de- "votion." But this holy awe, thus mechanically in- cited, would be as friendly to Paganism as Christi- anity; and indeed, this awe is so far from being holy, that it is a thing intirely distinct from rational piety and devotion, and may be felt without any inclination to enter the choir.

Indeed the multiplicity of puerile ornaments profusely lavished, the strong and beautiful perspective, and that romantic air of grandeur so visible in this structure, and above all, the height of the middle isle at our first entrance, fill the eye, strike us in a very forcible manner, and at once raise our admiration and astonishment. To which let it be added, that the ranges of venerable monuments on each hand, some of them most magnifi- cent, have a natural tendency to strike the mind with an uncommon degree of solemnity, and to raise the most serious reflections.

The extent of the building is very considerable; for it is three hundred and sixty feet within the walls, at the nave it is seventy-two feet broad, and at the cross one hundred and ninety-five. The Gothic arches and side-isses are supported by forty-eight pillars of grey marble, each composed of clusters of very slender ones, and covered with ornaments. The moment you enter the west door, the whole body of the church opens itself at once to your view, the pillars dividing the nave from the side-isses, being so formed as not to obstruct the side openings; nor is your sight terminated to the east, but by the fine painted window over Edward the Confessor's chapel, which anciently, when the altar was low, and adorned with the beautiful shrine of that pretended saint, must have afforded one of the finest prospects that can be imagined.

The pillars are terminated to the east by a sweep, in- closing the chapel of Edward the Confessor in a kind of semicircle. And it is worthy of observation, that as far as the gates of the choir, the pillars are filleted with brass, but all beyond with stone. Answering to the middle range of pillars, there are others in the wall, which, as they rise, spring into semi-arches, and are every where met in acute angles by their opposites; and meeting in the roof, are adorned with a variety of carvings. On the arches of the pillars are galleries of double columns, fifteen feet wide, covering the side-isses, and enlightened by a middle range of windows, over which there is an upper range of larger windows, and by these, together with the four capital windows, facing the north, east, south and west, the whole fabric is so admirably enlightened, that in the day you are never dazzled with its brightness, nor incommoded by its being too dark. But before we leave these capital windows, which are all finely painted, it is necessary to observe, that in the great west window is a curious painting of Edward III. to the left of which, in a smaller window, is a painting of one of our kings, supposed to

be Richard II. but the colours being of a water blue, the features of the face cannot be distinguished. On the other side the great window, is a lively representation of Edward the Confessor in his robes, and under his feet are painted his arms. At the bottom of the walls, be- tween the pillars, are shallow niches, arched about eight or ten feet high, on which the arms of the original benefactors are depicted, and over them are their titles, &c. but these are almost all concealed by the monu- ments of the dead placed before them, many of which are extremely noble, and which we shall particularly examine, after having gone through the several parts of the edifice.

After viewing the open part of the church, the next thing to be seen is the choir, which can only be done during the times of divine service. The grand entrance into it is by a pair of fine iron gates, on each side of which is a very magnificent tomb. The floor is paved with the finest black and white marble. The ancient stalls are covered with Gothic acute arches, supported by small iron pillars, and are painted purple; but what is most worthy of observation, is an ancient portrait, near the pulpit, of Richard II. sitting in a gilt chair, dressed in a green vest, flowered with gold, with gold shoes powdered with pearls. This piece is six feet eleven inches in length, and three feet seven inches in breadth; but the lower part is much defaced.

The next thing worthy of observation is the fire altar, enclosed with a curious balustrade, within which is a pavement of mosaic work, laid at the expence of Abbot Ware, in the year 1272, and is said to be one of the most beautiful of its kind in the world: the stones of which it is composed are porphyry, jasper, lydian and serpentine. The altar is a beautiful piece of marble, removed from Whitehall, and presented to this church by order of her majesty queen Anne. On each side of the altar are doors, opening into St. Edward's chapel.

Having taken a view of the structure of Westminster abbey, we proceed to survey the monuments that deco- rate this ancient pile, and preach in the most emphatic, tho' silent language, the great doctrine of mortality, and demonstrate to the eye of the spectator, that neither riches, honours, learning, or genius can avert the stroke of death, or preserve the human frame from re- turning to the dust, whence it was taken. But as it would carry us too far to mention all the monuments in this famous structure, we shall only describe those which more particularly merit attention.

In the open part of the Abbey near the pulpit is a very handsome monument erected to the memory of that learned grammarian Dr. Busby, master of West- minster school; who is represented in his gown, look- ing earnestly at the inscription, holding in his right- hand a pen, and in his left a book open. Upon the pedestal underneath are a variety of books, and at the top his family-arms. The inscription is a very elegant one, and intimates, that whatever fame the school of Westminster boasts and whatever advantages mankind may reap from thence in future times, they are all prin- cipally owing to the wise institutions of this gentleman, who was born at Lutton in Lincolnshire, on the 22d of September 1606, and after being preferred to the mas- ter-ship of Westminster school, he was elected prebendary of Westminster, and treasurer of Wells. He died on the 5th of April 1695.

The next monument is that erected to the memory of Robert South, D. D. who is represented in a recumbent posture, in his canonical habit, with his arm resting on a cushion, and his right-hand on a death's head. In his left hand he holds a book, with his finger between the leaves, as if just closed from reading, and over his head is a group of cherubs, issuing from a mantling. This monument is however very badly executed, and the statue itself clumsy and unmeaning. It has a long Latin inscription, shewing that this celebrated divine was scholar of Dr. Busby, and student at Christ Church, Oxford; that, by the patronage of the lord Clarendon, he was made prebendary both of Westminster and Christ- Church, and afterwards rector of Islip, where he built the parsonage-house, and founded a school for the educa-

tion of poor children. He died on eight of July 1718, in the eighty-third year of his age.

At the corner of the gate leading to the chapel of St. Benedict, is a plain neat monument to the memory of Mr. Dryden, adorned with no other ornament than an elegant bust of that great poet. It was erected by the late duke of Buckingham, who thought no inscription necessary to transmit the fame of that admired writer to posterity; we therefore only see these few words, J. Dryden, born 1632, died May 1, 1700, and underneath, John Sheffield, duke of Buckinghamshire, erected this monument 1720.

At a small distance is a plain neat monument to the memory of Abraham Cowley, on which is placed a flaming urn, begirt with a chaplet of laurel, expressive emblems of the glory he acquired by the spirit of his writings. The Latin inscription and epitaph on the pedestal have been thus translated.

“Near this place lies Abraham Cowley, the Pindar, Horace, and Virgil of England; and the delight, ornament, and admiration of this age.”

While, sacred bard, far worlds thy works proclaim,
And you survive in an immortal fame,
Here may you blest'd in pleasing quiet lie,
To guard thy urn may hoary Faith stand by;
And all thy favourite tuneful nine repair
To watch thy dust with a perpetual care.
Sacred for ever may this place be made,
And may no desperate hand presume t'invade
With touch unhallow'd, this religious room,
Or dare affront thy venerable tomb:
Unmoved and undisturb'd till time shall end,
May Cowley's dust this marble shrine defend.

So wishes, and desires that wish may be sacred to posterity, George, duke of Buckingham, who erected this monument for that incomparable man. He died in the forty-ninth year of his age, and was carried from Buckingham-house, with honourable pomp, his exequies being attended by persons of illustrious characters of all degrees, and interred August 13, 1667.

The monument of that ancient poet Geoffery Chaucer, was once a handsome one in the Gothic stile; but is now defaced by time. Chaucer, who is stiled the father of the English poets, was the son of Sir John Chaucer, a citizen of London, employed by Edward III. in negotiations abroad relating to trade. He was student at Cambridge; but afterwards studied at Merton College, Oxford; and to perfect himself in the knowledge of the laws, entered himself of the Middle Temple: thus accomplished, he soon became a favourite at court, and was employed as shield-bearer to the King; was a gentleman of the bedchamber, and by Edward III. was sent ambassador abroad. However, in the succeeding reign, he fell into disgrace, and was committed to the Tower for high treason, where he wrote his Testament of Love; but upon the death of Richard II. he became a greater favourite at court than ever, from his having married the great John of Gaunt's wife's sister. He was born in 1328, and died in 1400.

The plain monument of Mr. John Phillips, has his bust in relief, represented as in an arbour, interwoven with vines, laurel branches, and apple-trees; and over it is this motto, *Honos erit huic quoque pomo*, alluding to the high qualities ascribed to the apple, in his excellent poem called Cyder. He was author of but few pieces; but those were masterly performances. His *Blenheim*, *Splendid Shilling*, and *Lyric Ode to lord Bolingbroke on Tobacco*, have been much admired. He was the son of Dr. Stephen Phillips, archdeacon of Salop, was born at Brampton in Oxfordshire on the 30th of December 1676, and died of a consumption at Hereford, on the 15th of February 1708, in the prime of his life. The inscription on his monument contains an account of his virtues and abilities, and is the strongest testimony of his merit, since that alone could inspire his great patron Sir Simon Harcourt, Knt. with such a generous friendship for him, as to countenance and encourage him in the amplest manner when living, and to extend his regard for him after his death, by erecting this monument to his memory.

Next this is Mr. Michael Drayton's monument. This gentleman was esteemed an excellent poet, and learned antiquarian. The inscription and epitaph were formerly in gold letters; but are now almost obliterated, and are as follow.

“Michael Drayton, Esq; a memorable poet of his age, exchanged his laurel for a crown of glory, anno 1631.”
Do, pious marble! let my readers know
What they, and what their children owe
To Drayton's name, whose sacred dust
We recommend unto thy trust;
Protect his mem'ry and preserve his story;
Remain a lasting monument of his glory;
And when thy ruins shall disclaim,
To be the treasurer of his name:
His name, that cannot fade, shall be
An everlasting monument to thee.

Ben Johnson's monument is of white marble, and his bust is executed with great happiness and spirit; it is inclosed with a tablatur ornamented with a few proper and elegant decorations, consisting of emblematical figures: and has no other inscription but the words, O rare Ben Johnson! This gentleman was the son of a clergyman, and educated at Westminster school, while Mr. Camden was master; but after his father's death, his mother marrying a bricklayer, he was forced from school, and being obliged to work for his father, it is said, that, at the building of Lincoln's Inn he was sometimes seen at work with his trowel in one hand, and Horace in the other. However, Mr. Camden having an esteem for him on account of his abilities, recommended him to Sir Walter Raleigh. He attended that brave man's son in his travels, and upon his return, entered himself at Cambridge; afterwards he wrote a considerable number of plays; became poet-laureat to king James I. and died on the sixteenth of August 1637, aged sixty-three. His tomb was erected by the earl of Essex, who has inscribed his own name on the stone.

Spenser's tomb is of grey marble, and has suffered greatly by time. It was erected in an age when taste was in its infancy in England, and yet has something in it venerably plain, and not absurdly ornamental. The inscription upon it is as follows:

“Here lies (expecting the second coming of our Saviour Christ Jesus) the body of Edmund Spenser, the prince of poets in his time, whose divine spirit needs no other witness than the works he left behind him. He was born in London in 1510, and died in 1596.”

Above Spenser's monument is that of Samuel Butler, the author of *Hudibras*. By the Latin inscription, it appears, that it was erected by John Barber, Esq; citizen of London, and afterwards lord mayor in 1731, that he who was destitute of all things when alive, might not want a monument when dead. Mr. Butler was born at Shensham in Worcestershire in 1612, and died at London in 1680.

A plain and neat monument of white marble in memory of that divine poet, John Milton, who died in 1674. Under a very elegant bust made by Rysbrack is this inscription:

“In the year of our Lord Christ 1737, this bust of the author of *Paradise Lost* was placed here by William Benson, Esq; one of the two auditors of the imprest to his majesty, &c.”

The monument of Matthew Prior is adorned with great expence. On one side of the pedestal stands the figure of Thalia, one of the Muses, with a flute in her hand; and on the other History, with her book shut: between these statues is Prior's bust upon a raised altar, and over it is a handsome pediment, on the ascending sides of which are two boys, one with an hour-glass in his hand, run out; the other holding a torch, reversed. On the apex of the pediment is an urn, and on the base of the monument is a long inscription in Latin, mentioning the public posts and employments with which he had been intrusted; and above, we are informed, that while he was writing the history of his own times, death interposed, and broke both the thread of his discourse and of his life, on the eighteenth of September 1721, in the fifty-seventh year of his age.

The monument erected to the memory of the immortal Shakespear is worthy of that great dramatic writer, and both the design and execution are extremely elegant. Upon a handsome pedestal stands his statue in white marble, dressed in the habit of the time in which he lived, with one elbow leaning on a pile of books, and his head reclined on his hand, in a posture of meditation. The attitude, the dress, the shape, the genteel air, and fine composure observable in this figure of Shakespear, cannot be sufficiently admired; and the beautiful lines of his own composition on the scroll, are happily chosen:

The cloud-cap'd towers,
The gorgeous palaces,
The solemn temples,
The great globe itself,
Yea, all that it inherits,
Shall dissolve;

And, like the baseless fabric of a vision,
Leave not a wreck behind.

Immediately over his head, upon a curious piece of dark-coloured marble, is the following inscription, in capital letters, raised in gold:

GULIELMO SHAKESPEAR,
ANNO POST MORTEM CXXV.
AMOR PUBLICUS POSUIT.

The heads on the pedestal, representing Henry V. Richard III. and queen Elizabeth, three principal characters in his plays, are likewise proper ornaments to grace his tomb. In short, the taste that is here shewn does honour to those great names under whose direction, by the public favour, it was so elegantly constructed; these were the earl of Burlington, Dr. Mead, Mr. Pope, and Mr. Martin. It was designed by Kent, and executed by Scheemakers; the expence being defrayed by the grateful contributions of the public.

Mr. Fleetwood, then master of Drury lane theatre, and Mr. Rich of Covent-garden, gave each a benefit, arising from one of his own plays, towards it, and the dean and chapter made a present of the ground.

The next monument is a very fine one to the memory of Nicholas Rowe, Esq; and his only daughter. On a pedestal about twenty inches high, which stands on an altar, is a fine bust of Mr. Rowe; near it is his lady in the deepest affliction, and between both, on a pyramid behind, is a medalion, with the head of a young lady in relief. On the front of the pedestal is this inscription:

To the memory of Nicholas Rowe, Esq; who died in 1718, aged forty-five, and of Charlotte, his only daughter, wife of Henry Fane, Esq; who inheriting her father's spirit, and amiable in her own innocence and beauty, died in the twenty-third year of her age, 1739.

Underneath, upon the front of the altar, are these lines:

Thy reliques, Rowe! to this sad shrine we trust,
And near thy Shakespear place thy honour'd bust.
Oh! skill'd, next him, to draw the tender tear,
For never heart felt passion more sincere:
To nobler sentiments to fire the brave,
For never Briton more disdain'd a slave!
Peace to thy gentle shade, and endless rest,
Blest in thy genius, in thy love too blest!
And blest, that timely from our scene remov'd,
Thy soul enjoys that liberty it lov'd.

To these so mourn'd in death, so lov'd in life,
The childless mother, and the widow'd wife,
With tears inscribes this monumental stone,
That holds their ashes, and expects her own.

Near this last, is a fine monument erected to the memory of Mr. John Gay, by the duke and dutchess of Queensberry, his great patrons. His bust is a very good one, and the masks, instruments of music, and other devices, are blended together in a group, in allusion to the various species of writings in which he excelled, as farce, satire, fable, and pastoral. The short epitaph in the front was written by himself, and has given some offence, as the sentiment, at first view, seems by no means proper for a monument;

Life is a jest, and all things shew it:
I thought so once, but now I know it.

Underneath are these lines:

Of manners gentle, of affections mild;
In wit, a man; simplicity, a child;
With native humour temp'ring virtuous rage,
Form'd to delight, at once, and last the age;
Above temptation in a low estate,
And uncorrupted, ev'n among the great.
A safe companion, and an easy friend;
Unblam'd through life, lamented in thy end.
These are thy honours; not that here thy bust
Is mix'd with heroes, or with kings thy dust;
But that the worthy and the good shall say,
Striking their pensive becoms—Here lies Gay.

A. POPE.

Here lie the ashes of Mr. John Gay, the warmest friend, the gentlest companion, the most benevolent man; who maintained independency in low circumstances of fortune; integrity, in the midst of a corrupt age; and that equal serenity of mind, which conscious goodness alone can give, throughout the whole course of his life. Favourite of the Muses, he was led by them to every elegant art, refined in taste, and fraught with graces all his own. In various kinds of poetry, superior to many, inferior to none: his works continue to inspire what his example taught; contempt of folly, however adorned; detestation of vice, however dignified; reverence of virtue, however disgraced.

Charles and Catharine, duke and dutchess of Queensberry, who loved his person living, and regret him dead, have caused this monument to be erected to his memory.

The next is a most magnificent, lofty and elegant monument, erected to the late duke of Argyle, enclosed with rails, and decorated with figures finely executed. The statue of the duke is spirited, even at the verge of life. On one side of the base is Pallas, and on the other Eloquence; the one looking sorrowfully up at the principal figure above, and the other pathetically displaying the public loss at his death. Above is the figure of History, with one hand holding a book, and with the other writing on a pyramid of most beautiful variegated marble, admirably polished, the name and titles of the hero in large gold letters, JOHN DUKE OF ARGYLE AND GR. at which point the pen of History rests. His actions are supposed to be contained in the book she holds in her other hand, on the cover of which, in letters of gold, are inscribed the date of his Grace's death, and the years of his life. Above is inscribed on this beautiful pyramid in gold letters, the following epitaph, said to be written by Paul Whitehead, Esq;

Britain, behold, if patriot worth be dear,
A shrine that claims thy tributary tear:
Silent that tongue admiring senates heard:
Nerveless that arm opposing regions fear'd:
Nor less, O Campbell! thine the pow'r to please,
And give to grandeur all the grace of ease.
Long from thy life let kindred heroes trace
Arts which ennoble still the noblest race,
Others may owe their future fame to me,
I borrow immortality from thee.

On the base of the monument is this inscription:

In memory of an honest man, a constant friend,
JOHN, the great duke of Argyle and Greenwich, a general and orator exceeded by none in the age he lived. Sir Henry Fermer, Bart. by his last will, left the sum of five hundred pounds towards erecting this monument, and recommended the above inscription.

The monument of Isaac Barrow, D. D. is remarkable for a fine bust of that great divine and mathematician, who, as the inscription shews, was chaplain to king Charles II. head of Trinity College, Cambridge; professor of geometry at Gresham-college in London, and of Greek and mathematics at Cambridge. He died on the fourteenth of May 1677, aged forty-seven.

The monument of George Frederick Handel was the last which that eminent statuary Rubiliac lived to finish. The statue of that great musician is very elegant, and the face a strong likeness of its original. The left arm is resting on a group of musical instruments, and the attitude

attitude is very expressive of great attention to the harmony of an angel playing on an harp in the clouds over his head. Before it lies the celebrated oratorio of the Messiah, with that part open, where is the much admired air, "I know that my Redeemer liveth." Beneath only this inscription:

George Frederick Handell, Esq; born February twenty-third, 1684. Died April fourteenth, 1759.

Next to Mr. Handell's is a monument erected to the memory of that eminent divine and philosopher, Dr. Stephen Hales. Here you see two beautiful figures in relief, the one Botany, the other Religion. Botany is presenting a medalion of this great explorer of nature to public view; Religion is deploring the loss of the divine: at the feet of Botany the winds are displayed on a globe, which allude to his invention of the ventilators. The Latin inscription is to the following effect:

To the memory of Stephen Hales,
Doctor in divinity, Augusta, the mother,
Of that best of kings, George the third,
Has placed this monument;
Who chose him when living,
To officiate as her chaplain;

And after he died, which was on the fourth of January,
1761, in the eighty-fourth year of his age,
Honoured him with this marble.

About the tomb of Hales, whose fair design
And polish great Augusta caus'd to shine,
Religion, hoary Faith, and Virtue wait,
And shed perpetual tears in mournful state.
But o'er the preacher, render'd to his clay,
The voice of Wisdom still has this to say:

"He was a man to hear afflictions cry,
"And trace his Maker's works with curious eye:
"O HALES! thy praises not the latest age,
"Shall e'er diminish, or shall blot thy page,
"ENGLAND, so proud of Newton, shall agree,
"She has a son of equal rank in thee."

A neat monument erected to the memory of the learned Isaac Casaubon, by Dr. Moreton, bishop of Durham. That profound scholar and critic, whose name is inscribed upon it, was born in France, and in his younger years was keeper of the royal library at Paris; but at length being dissatisfied with the Romish religion, he, upon the murder of his great patron, Henry IV. quitted his native country, and, at the earnest entreaty of king James I. settled in England, where he died in 1614, aged forty-five.

Next to the west corner of the south cross is an ancient monument to the memory of that great antiquarian, William Camden, who is represented in a half length, in the dress of his time, holding a book in his right hand, and in his left his gloves. He rests on an altar, on the body of which is a Latin inscription, which mentions his indefatigable industry in illustrating the British antiquities, and his candour, sincerity, and pleasant good humour in private life. He died November the ninth, 1623.

The monument of the brave Sir Cloudefly Shovel, who here appears a very unmeaning figure, with a large stiff wig, reposing himself upon velvet cushions under a canopy of state; and on the base is represented in bas relief, the ship Association in which the admiral last failed, striking against a rock, with several others perishing at the same time; and at the top are two boys blowing trumpets.

This monument has been highly censured by all persons of taste, though it is erected to his memory at great expence, and even by his sovereign queen Anne. The great Mr. Addison has justly exposed it in the Spectator, and complains at this brave rough English admiral's being here represented by the figure of a beau; and also censures the inscription, which, instead of celebrating the many remarkable actions he had performed in the service of his country, only informs us of the manner of his death, from which it was impossible to reap any honour, though it may excite our pity. The inscription is as follows:

Sir Cloudefly Shovel; Knt. rear-admiral of Great Britain, and admiral and commander in chief of the fleet—the just reward of his long and faithful services. He was deservedly beloved of his country, and esteemed, though dreaded by the enemy, who had often experienced his conduct and courage. Being shipwrecked on the rocks of Scilly, in his voyage from Toulon, the twenty-second of October 1707, at night, in the fifty-seventh year of his age. His fate was lamented by all, but especially by the seafaring part of the nation, to whom he was a generous patron, and a worthy example. His body was flung on the shore, and buried with others in the sand; but being soon after taken up, was placed under this monument, which his royal mistress had caused to be erected to commemorate his steady loyalty and extraordinary virtues.

At some distance from Sir Cloudefly's, is a stately monument erected for Sir Palmes Fairborne. Two pyramids of black marble standing on cannon balls, have two Moorish emperors heads in profile on their tops; these pyramids are adorned with relievos; on one Sir Palmes is shot while viewing the enemy's lines before the town; and on the other is a hearse and six horses bringing him off wounded to the castle. Above, in a lofty dome, are the arms of the deceased, with this motto underneath, TUTUS SI FORTIS; and over his arms a Turks head on a dagger, by way of crest, which he won by his valour in fighting against that people in the German war. On this monument is the following inscription:

"Sacred to the immortal memory of Sir Palmes Fairborne, Knt. governor of Tangier; in execution of which command, he was mortally wounded by a shot from the Moors, then besieging the town, in the forty-sixth year of his age, October twenty-fourth, 1680.

His epitaph, wrote by Mr. Dryden, runs thus:

Ye sacred reliques, which your marble keep,
Here undisturb'd by wars, in quiet sleep:
Discharge the trust, which (when it was below)
Fairborne's undaunted soul did undergo,
And be the town's palladium from the foe.
Alive and dead these walls he will defend:
Great actions great examples must attend.
The Candian siege his early valour knew,
Where Turkish blood did his young hands imbrue;
From thence returning, with deserv'd applause,
Against the Moors his well-flesh'd sword he draws,
The same the courage, and the same the cause.
His youth and age, his life and death combine,
As in some great and regular design,
All of a piece throughout, and all divine.
Still nearer heav'n his virtue shone more bright,
Like rising flames expanding in their height,
The martyr's glory crown'd the soldier's fight.
More bravely British general never fell,
Nor general's death was e'er reveng'd so well,
Which his pleas'd eyes beheld before their close,
Follow'd by thousand victims of his foes.

To his lamented loss, for times to come,
His pious widow consecrates this tomb.

An elegant monument, erected to the memory of the Hon. Roger Townshend, Esq. The back of the monument is a flat pyramid of variegated marble; about the middle of which is a beautiful piece of basso relievo, finely executed, representing the death of this gallant commander. This piece, which is of white marble highly polished, is supported by two Americans in the dress of their country, the one armed with a towmahawk, and the other with a fusée. Between those statues, and under the basso relievo, is the following inscription.

This monument was erected by a disconsolate
Parent, the Lady Viscountess Townshend,
To the memory of her fifth son,
The Honourable Lieutenant Colonel Roger Townshend,
Who was killed by a cannon ball on the 25th of
July, 1759, in the 28th year of his age,
As he was reconnoitering the French lines at
Ticonderago in North America.

From the parent, the brother, and the friend,
 His social and amiable manners,
 His enterprising bravery,
 And integrity of his heart,
 May claim the tribute of affliction.
 Yet, stranger! weep not;
 For tho' premature his death,
 His life was glorious;
 Enrolling him with the names of those immortal
 Statesmen and commanders,
 Whose wisdom and intrepidity,
 In the course of this comprehensive and successful war,
 Have extended the commerce,
 Enlarged the dominion,
 And upheld the majesty of these kingdoms,
 Beyond the idea of any former age.

Above is the monument of Sir John Chardin, who distinguished himself by his travels into the east, adorned with a globe, which exhibits a view of the different countries he visited, and around it are represented a number of geographical instruments.

Next to Sir John Chardin's, and in the same elevated situation is a very elegant monument erected to General Hargrave, representing the general resurrection. The archangel appears in the clouds sounding his trumpet, on which awful summons, the monument appears as tumbling into pieces. The tomb opens, and the deceased appears rising from the sepulchre with the winding sheet expanded in one of his hands. In his countenance are imprinted those marks of awe and terror which must seize upon every mortal at that dreadful period. On the side of the tomb lies death prostrate on the ground conquered by time, with his crown fallen from his head; or as the apostle elegantly expresses it, "swallowed up in victory." While time is standing over the king of terrors with his scythe reversed, and breaking the mortal shaft of death. It was executed by the famous Rubiliac.

A tomb erected to the memory of Anne Fielding, the first wife of Sir Samuel Morland, Knt. and Bart. is remarkable only for having two very-learned inscriptions: the first, in Hebrew, is to this effect.

O thou fairest among women! O virtuous woman!
 The hand of the Lord has done this.

The Lord gave and the Lord hath taken away, blessed be the name of the Lord.

Underneath this is an Ethiopic inscription, which has been thus translated.

Come let us lament over this monument, raised for thee by a beloved husband; but in certain hope thou art united with Christ.

This lady was truly religious, virtuous, faithful, and as a dove, mild and chaste; while she continued in life, she was honoured, and, through mercy, is happy in death.

Under the Ethiopic is this inscription in English;
 Anne, daughter to George Fielding, Esq; and of Mary his wife, the truly loving (and as truly beloved) wife of Samuel Morland, Knt. and Bart. died Feb. 20, Ann. Dom. 1679-80.

Near this last is a tomb much in the same taste, erected to the memory of Carola Harfnet, the second wife of the same Baronet, who died in childbed of her second son, Oct. 10, 1674, in the 23d year of her age. Here are two inscriptions, the first in Hebrew, and the other in Greek, which have been thus translated.

Blessed be the Lord my wife was precious: blessed be thy remembrance, O virtuous woman.

When I think of thy mildness, patience, charity, modesty and piety, I lament thee, O most excellent creature, and grieve exceedingly: but not like such as have no faith; for I believe and expect the resurrection of those who sleep in Christ.

Between the two former is a beautiful monument to the memory of John Smith, Esq; A fine bust in relieve of that gentleman is supported by a weeping figure representing his daughters, both which are designed and executed with great judgment and spirit. The Lady sits upon an urn, which with its base and pyramid a be-

hind, unite the whole in a most harmonious and agreeable stile. On the base is a Latin inscription, setting forth his descent and issue.

Above these is a very superb monument, to the memory of General Fleming. Hercules is represented as binding up his trophies; while Minerva, sitting in a pensive attitude, is pointing to a medallion of the general, placed on a column above these statues. The figures are finely executed, and intended to represent that wisdom to plan, and strength to execute, were united in General Fleming; but has been severely censured by Mr. Harvey, in his *Theron and Asaph*, as very improper for a christian church, the statue of Hercules having no other covering than that of a lion's skin, by which the nudities, in the opinion of that ingenious writer, are too much exposed.

Next to the above, and over the door that opens into the cloisters, is a noble and elegant monument erected to General Wade. In the center is a beautiful marble pillar, enriched with military trophies, most exquisitely wrought. The principal figures are Fame pushing back Time, who is eagerly approaching to demolish the pillar, with all the ensigns of honour with which it is adorned; the General's head is in a medallion, and the whole is executed with great beauty and elegance. The inscription underneath runs thus:

"To the memory of George Wade, field-marshal of his majesty's forces, lieutenant general of the ordnance, colonel of his majesty's third regiment of dragoon guards, governor of fort-William, fort-Augustus and fort-George, and one of his majesty's most honourable privy council. He died March 14, 1748, aged seventy-five."

An elegant monument of Mrs. Katharine Bovey. Faith is here represented with her book closed, and Wisdom lamenting the death of her patroness, between which is the lady's head in relief, enclosed in an annulet of black marble curiously veined. The inscription, which is in English, gives us an excellent character of the deceased, who died on the twenty-first of January 1726, in the seventy-second year of her age; and informs us that Mrs. Mary Pope, who lived with her near forty years in perfect friendship, erected this monument to her memory.

Above this is a fine monument, to the memory of the late gallant Lord Howe. On the top is a trophy of arms in curious marble; and on a flat pyramid of black marble, are his lordship's arms, coronet; and crest, in white marble: on the top of the monument sits the figure of a woman in a melancholy position, representing the province of Massachusetts bay, and on a large tablet of marble, the following inscription.

"The province of Massachusetts bay, in New England, by an order of the great and general court, bearing date Feb. 1, 1759, caused this monument to be erected to the memory of George Augustus, Lord Viscount Howe, brigadier general of his majesty's forces in America, who was slain on the sixth of July, 1758, on his march to Ticonderago, in the thirty-fourth year of his age; in testimony of the sense they had of the services and military virtues, and of the affection their officers and soldiers bore to his command. He lived respected and beloved; the public regretted his loss; to his family it is irreparable."

A small table monument to the memory of Mr. Henry Wharton, which is only remarkable on account of the distinguished character of the person whose name is inscribed upon it. Mr. Wharton was rector of Chatham in Kent, vicar of the church of Minster in the isle of Thanet, chaplain to archbishop Sancroft, and one of the most voluminous writers of his years. He died on the third of March 1694, aged only thirty one, and was so universally respected by the bishops and clergy, that archbishop Tillotson, and several other prelates, with a vast body of the clergy, the choir and king's scholars, all in solemn procession, attended at his funeral, and joined in an anthem composed on this occasion by the great Purcell.

The monument of John Friend, M. D. has an admirable bust of that gentleman, standing on a pedestal of fine white veined marble, and under it is a long inscription

scription in Latin, setting forth the distinguished acquirements, and great abilities of that eminent physician.

Mr. Congreve's monument has an half length marble portrait of that gentleman, placed on a pedestal of fine Egyptian marble, and enriched with emblematical devices relating to the drama. Underneath is this inscription in English.

Mr. William Congreve died the nineteenth of January, 1728, aged fifty-six, and was buried near this place. To whose most valuable memory this monument is set up by Henrietta Duchefs of Marlborough, as a mark how dearly she remembers the happiness she enjoyed in the sincere friendship of so worthy and honest a man, whose virtue, candour and wit, gained him the love and esteem of the present age; and whose writings will be the admiration of the future.

The monument of the Right Hon. James Craggs, Esq; his statue is represented leaning on an urn, and was one of the first in the abbey represented standing. The inscription, which is in golden characters, shews that he was principal secretary of state, and a man universally beloved, which is there particularly remarked, because as he was only a shoe-maker's son, it is the more surprizing that in the high station to which he was raised by his merit, he should escape envy, and acquire the general esteem. He died on the sixteenth of Feb. 1720. Upon the base of this monument are the following lines, written by Mr. Pope:

Statesman, yet friend to truth, of soul sincere,
In action faithful, and in honour clear.
Who broke no promise, serv'd no private end;
Who gained no title, and who lost no friend;
Ennobled by himself, by all approv'd:
Prais'd, wept, and honour'd by the muse he lov'd.

A. Pope.

On the south-side of the great west entrance is a noble monument erected to the memory of the brave Captain Cornwall, who, after distinguishing himself by his heroism, was unhappily slain in battle between the English fleet, commanded by the Admirals Matthews and Lestock, and the combined fleets of France and Spain. This monument was erected to his honour by order of parliament, and is a noble testimony of the public gratitude for his distinguished merit. On the back is a lofty pyramid of Egyptian marble, beautifully variegated, and finely polished, standing on a base of the same marble. Upon this base is a rock of white marble, along the different parts of which run sea-weeds. Near the top stands a fine figure of Fame, placing a medallion of the captain on the summit of the rock, underneath which is a naval crown, a globe, the trumpet of Fame, and other ornaments, and behind rises to the top of the pediment a palm, entwined with a laurel. On the other side of the medallion stands a beautiful Britannia, with the British lion couchant at her feet. Beneath, in an opening of the rock, is a Latin inscription on a fine piece of polished porphyry, mentioning his descent, and the manner of his death, which happened while fighting for his country, on the third of Feb. 1743, in the forty-fifth year of his age, and that the senate of Britain consecrated this monument to his memory. In another opening of the rock, a little lower, is represented in bas relief a view of the engagement in which this great man perished, and at the bottom of the rock on the sides lie canons, flags, anchors, &c. all of white marble.

The next is an elegant monument for Sir Thomas Hardy, Knt. On the back is a lofty pyramid of a bluish coloured marble, at the foot of which the statue of the deceased is placed, reclining upon a tomb of elegant workmanship, with a naked boy on his left side weeping over an urn: the enrichments round the pedestal on which he stands are just and proper; and the inscription contains the following short history of his life.

Sir Thomas Hardy, to whose memory this monument is erected, was bred in the royal navy from his youth, and was made a captain in 1693.

In the expedition to Cadiz, under Sir George Rooke, he commanded the Pembroke; and when the fleet left the coast of Spain, to return to England, he was or-

dered to Lagos Bay, when he got intelligence of the Spanish galleons being arrived in the harbour of Vigo, under convoy of seventeen French men of war: by his great diligence and judgment he joined the English fleet, and gave the admiral that intelligence which engaged him to make the best of his way to Vigo; where all the afore-mentioned galleons and men of war were either taken or destroyed.

After the success of that action, the admiral sent him with an account of it to the queen, who ordered him a considerable present, and knighted him.

Some years afterwards he was made a rear admiral, and received several other marks of favour and esteem from her majesty, and from her royal consort Prince George of Denmark, Lord High Admiral of England.

The monument of Sir Godfrey Kneller, Knt. has a bust of Sir Godfrey under a canopy of state, the curtains of which are gilt, and tied with golden strings, and on each side the bust is a weeping Cupid, one resting on a framed picture, the other holding a painter's pallet and pencils. This monument is not however much esteemed.

In the pedestal is a Latin inscription, signifying that Sir Godfrey Kneller, Knt. who lies interred here, was painter to king Charles II. king James II. king William III. queen Anne, and king George I. Underneath is his epitaph written by Mr. Pope, which has been also much censured.

Kneller, by heav'n, and not a master taught,
Whose art was nature, and whose pictures thought;
Now for two ages having snatch'd from fate
Whate'er was beauteous, or whate'er was great,
Rests crown'd with princes honours, poets lays,
Due to his merit, and brave thirst of praise.
Living, great nature fear'd he might outvie
Her works, and dying fears herself may die.

A. Pope.

The monument of John Woodward, M. D. is a very beautiful one, and the figures most admirably finished. The head of the deceased is represented in profile in a very masterly manner, and the lady who holds it is imimitably performed. The inscription contains a panegyric on the parts and learning of the deceased.

The monument of Mr. Killegrew has been reckoned one of the best pieces of sculpture in the whole church, and what is remarkable, is cut out of one stone. The embellishments are distinct and very picturesque, and the inscription short, modest, and soldier-like. It is as follows: Robert Killegrew, of Arwenach in Cornwall, Esq; son of Thomas and Charlotte, page of honour to king Charles II. brigadier general of her majesty's forces, killed in Spain in the battle of Almansa, the fourteenth of April, 1707. *Ætatis suæ 47. Militavi Annis 24.*

The next monument of note is that erected to the memory of the celebrated Dr. Mead. The bust of that great man is finely executed, and will convey to posterity the features of a physician, who did honour to his country: but the Latin inscription cannot be commended for the elegance of the language.

The monument of Philip Carteret, son to Lord George Carteret, who died a king's scholar at Westminster, ripe for the university, on the nineteenth of March 1710, aged nineteen. On the upper part is an admirable bust of this noble youth, and underneath a very fine figure of Time standing on an altar; and holding a scroll in his hand, whereon is written, in Saphic verses, lines to the following import, which he is supposed to be repeating.

Why flows the mournful muse's tear,
For thee! cut down in life's full prime?
Why sighs for thee, the parent dear!
Cropt by the scythe of hoary Time?

Lo! this, my boy's, the common lot!
To me thy memory entrust;
When all that's dear shall be forgot,
I'll guard thy venerable dust.

From age to age as I proclaim
Thy learning, piety, and truth,
Thy great example shall inflame,
And emulation raise in youth.

A small

A small but elegant monument, erected to the memory of the celebrated Henry Purcell, Esq; well known by his admirable musical composition. The inscription consists of this short and comprehensive sentence:

"Here lies Henry Purcell, who left this life, and is gone to that blest peace, where only his harmony can be exceeded. He died the twenty-first of November, 1697, in his thirty-seventh year."

The next is the monument erected to the memory of admiral West, on which is the following inscription:

Sacred to the memory of TEMPLE WEST, Esq;
Who dedicating himself from his earliest youth
To the naval service of his country,
Rose with merit and reputation to the rank of
Vice-admiral of the white:
Sagacious, active, industrious,
He was a skilful seaman,
Cool, intrepid, and resolute.
He approved himself a gallant officer
In the signal victory
Obtained over the French, May 3, 1747.
He was Capt. of the ship which carried Sir Peter Warren,
And acquir'd peculiar honour,
Even on that day of general glory,
In the less successful engagement near Minorca, May 20, 1756,
Wherein as rear-admiral he commanded the 2d division.
His distinguished courage and animating example
Were admired by the whole British squadron;
Confess'd by that of France;
And amidst the national discontent which follow'd,
Rewarded as they deserv'd by the warmest applause of
His country, and the just approbation of his sovereign.
On the 17th Nov. following
He was appointed
One of the lords commissioners of the admiralty.
He adorned this station
By a modesty which concealed from him his own merit,
And a candor which dispos'd him to reward that of others.
With these public talents
He possess'd the milder graces of domestic life.
To the frank and generous spirit of an officer,
He added the ease and politeness of a gentleman,
And with the moral and social virtues of a good man,
He exercised the duties of a christian.
A life so honourable to himself,
So dear to his friends, so useful to his country,
Was ended at the age of 43, A. D. 1757.
To preserve to posterity
His fame and his example,
This monument was erected
By the daughter of the brave unfortunate Balchen,
The wife of Temple West,
A. D. 1761.

The next is the monument of William Croft, doctor of music: on the pedestal is an organ in bas relief, and on the top a bust of the deceased.

Near the above is a neat monument, erected to Philip de Saufmarez, where the portrait of the deceased is well executed in basso relieve: and below is the following inscription:

"Sacred to the memory of Philip de Saufmarez, Esq; one of the few whose lives ought rather to be measured by their actions than their days. From sixteen to thirty-seven years of age, he served in the navy, and was often surrounded with dangers and difficulties unparalleled, always approving himself an able, active, and gallant officer. He went out a lieutenant on board his majesty's ship the Centurion, under the auspicious conduct of commodore Anson, in his expedition to the south seas. He was commanding officer of the said ship, when she was driven from her moorings at the isle of Tinian, in the year 1746. Being captain of the Nottingham, a sixty gun ship, he (then alone) attacked, and took the Mars, a French ship of sixty-four guns. In the first engagement of the following year, when admiral Anson defeated, and took a squadron of French men of war and Indiamen, he had an honourable share: and in the second, under admiral Hawke, when the enemy, after a long and obstinate resistance, was again routed, in

puruing two ships that were making their escape, he gloriously, but unfortunately, fell. He was the son of Matthew de Saufmarez, of the island of Guernsey, Esq; by Ann Durel of the island of Jersey, his wife. He was born the seventeenth of November, 1710; killed the fourteenth of October, 1747; buried in the old church at Plymouth, with all the honours due to his distinguished merits; and this monument is erected out of gratitude and affection by his brothers and sisters."

The tomb of John Blow, doctor of music, is adorned with cherubs, flowers, and a canon in four parts, set to music. In the centre is an English inscription, by which it appears he was organist, composer, and master to the children in the Chapel Royal thirty-five years, and organist to this abbey fifteen years; that he was scholar to Dr. Christopher Gibbons, and master to the famous Mr. Purcell, and to most of the eminent masters of his time. He died on the first of October, 1708, in his sixtieth year; and his epitaph observes, that his own musical compositions, especially his church music, are a far nobler monument to his memory, than any other that can be raised to him.

We come now to the neat and elegant monument of Dr. Boulter, archbishop of Armagh, in Ireland. It is of the finest marble, beautified with an admirable new-invented polish. The bust of this worthy archbishop is finely executed: his long flowing hair has all the gracefulness of nature, without the smallest degree of that stiffness which belongs to stone; and his venerable countenance strikes the beholder with reverence. The engravings of his dignity, wherewith the monument is adorned, are most exquisitely fine, and every part about it discovers a masterly genius in the sculptor. The inscription is inclosed in a beautiful border of porphyry, and is as follows:

"Dr. Hugh Boulter, late archbishop of Armagh, primate of all Ireland; a prelate so eminent for the accomplishments of his mind, the purity of his heart, and excellence of his life, that it may be thought superfluous to specify his titles, recount his virtues, or even erect a monument to his fame. His titles he not only deserved, but adorned; his virtues are manifest in his works, which had never dazzled the public eye, if they had not been too bright to be concealed; and as to his fame, who has any sense of merit, any reverence for piety, any passion for his country, or any charity for mankind, will assist in preserving fair and spotless that, when brass and marble shall mix with the dust they cover: every succeeding age may have the benefit of his illustrious example. He was born on the fourth of January, 1667; was consecrated bishop of Bristol, 1718; translated to the archbishoprick of Armagh, 1723; and from thence to heaven, on the twenty-seventh of September, 1742."

A monument erected to Richard Keane, Esq; governor of Minorca, adorned with a curious bust of that gentleman in white marble, placed on a handsome pedestal, whereon are inscribed the most remarkable passages of his life. He was born at Down in Ireland, on the twentieth of December, 1661; in 1689, he first appeared in a military capacity, at the memorable siege of Derry; and after the reduction of Ireland, followed king William into Flanders, where he distinguished himself, particularly by his intrepid behaviour at the siege of Namur, where he was grievously wounded: in 1702, he bore a commission in the service of queen Anne, and assisted in the expedition to Canada, from whence he again returned into Flanders, and fought under the duke of Argyle and Greenwich, and afterwards under lord Carpenter: in 1712, he was made sub-governor of Minorca, through which island he caused a road to be made, which had been thought impracticable: in 1720, he was ordered by king George I. to the defence of Gibraltar, where he sustained an eight months siege against the Spaniards, when all hope of relief was extinguished; for which gallant service he was afterwards, by king George II. rewarded with the government of Minorca, where he died on the nineteenth of December, 1735, and was buried in the castle of St. Philip.

We now come to the monument erected to the memory of that commander, Aubrey Beauclerk, ornamented with

with arms, trophies, and naval ensigns; and in an oval niche, on a beautiful pyramid of dove-coloured marble, is a fine bust of that young hero. On this pyramid is the following historical inscription:

“The lord Aubrey Beauclerk was the youngest son of Charles duke of Saint Alban’s, by Diana, daughter of Aubrey de Vere, earl of Oxford. He went early to sea, and was made a commander in 1731; and in 1740, he was sent on that memorable expedition to Carthage, under the command of admiral Vernon, in his majesty’s ship the Prince Frederick, which, with three others, was ordered to cannonade the castle of Bocca-chica. One of these being obliged to quit her station, the Prince Frederick was exposed not only to the fire of the castle, but to that of fort St. Joseph; and to two ships that guarded the mouth of the harbour; which he sustained for many hours that day, and part of the next, with uncommon intrepidity. As he was giving his commands upon deck, both his legs were shot off; but such was his magnanimity, that he would not suffer his wounds to be dressed till he communicated his orders to his first lieutenant, which were, to fight his ship to the last extremity. Soon after this, he gave some directions about his private affairs, and then resigned his soul with the dignity of an hero and a christian. Thus was he taken off in the thirty-first year of his age; an illustrious commander, of superior fortitude and clemency, amiable in his person, steady in his affections, and equalled by few in the social and domestic virtues of politeness, modesty, candour, and benevolence. He married the widow of colonel Alexander, a daughter of Sir Henry Newton, knight, envoy extraordinary to the court of Florence, and the republic of Genoa, and judge of the high court of Admiralty.”

Over this inscription is the following epitaph, written by Dr. Young.

Whilst Britain boasts her empire o’er the deep,
This marble shall compel the brave to weep,
As men, as Britons, and as soldiers mourn:
’Tis dauntless, loyal, virtuous Beauclerk’s urn.
Sweet were his manners, as his soul was great,
And ripe his worth, tho’ immature his fate;
Each tender grace that joy and love inspires,
Living, he mingled with his martial fires;
Dying, he bid Britannia’s thunder roar,
And Spain still felt him, when he breath’d no more.

A beautiful monument erected to the memory of admiral Balchen, on which is his bust in the finest white marble. The enrichments, arms, and trophies, are admirably wrought; but in fastening the cable to the anchor, this excellent artist has shewn, that he is no mariner: in the front is a fine representation of a ship in a storm. The inscription is as follows: “To the memory of Sir John Balchen, knight, admiral of the white squadron of his majesty’s fleet: in 1744, being sent out commander in chief of the combined fleets of Holland and England, to cruize on the enemy, was, on his return home, in his majesty’s ship the Victory, lost in the channel by a violent storm; from which sad circumstance of his death we may learn, that neither the greatest skill, judgment, or experience, joined to the most firm, unshaken resolution, can resist the fury of the winds and waves; and we are taught from the passages of his life, which were filled with great and gallant actions, but ever accompanied with adverse gales of fortune, that the brave, the worthy, and the good man, meets not always his reward in this world. Fifty-eight years of faithful and painful services he had passed, when being just retired to the government of Greenwich hospital, to wear out the remainder of his days, he was once more, and for the last time, called out by his king and country, whose interest he ever preferred to his own, and his unwearied zeal for their service ended only in his death; which weighty misfortune to his afflicted family became heightened by many aggravating circumstances attending it; yet, amidst their grief, had the mournful consolation to find his gracious and royal master mixing his concern with the general lamentations of the public for the calamitous fate of so zealous, so valiant, and so able a commander; and as a lasting memorial of the

sincere love and esteem borne by his widow to a most affectionate and worthy husband, this honorary monument was erected by her. He was born on the second of February, 1669; married Susannah, daughter of Col. Afceeece of Wainingly, in the county of Huntington. Died on the seventh of October, 1744, leaving one son, and one daughter; the former of whom, George Balchen, survived him but a short time; for being sent to the West Indies in 1745, commander of his majesty’s ship the Pembroke, he died at Barbadoes in December, the same year, aged twenty-eight, having walked in the steps, and imitated the virtue and bravery of his good, but unfortunate father.”

The next monument to that of admiral Balchen, is a noble and elegant pile, erected in honour of general Gueft. It is adorned with a pyramid and base of the most beautiful Egyptian porphyry, ornamented with the finest enrichments; and on the latter is an admirable bust of the general in white marble. The whole is executed in the most delicate and masterly manner. It has the following short, but apposite inscription:

“Sacred to those virtues that adorn a christian and a soldier, this marble perpetuates the memory of lieutenant-general Joshua Gueft, who closed a service of sixty years, by faithfully defending Edinburgh Castle against the rebels, 1745.”

Over the north door is a magnificent monument erected to the memory of admiral Watson; where you see, in the centre of a range of palm-trees, an elegant figure of the admiral in a Roman toga, with a branch of palm in his right hand, and is receiving the address of a prostrate figure representing the genius of Calcutta, a place that the admiral relieved, and retook from the Nabob in January 1757. On the other side is the figure, in chains, of a native of Chandernagore, another place taken by the admiral the March following. On the front is this inscription:

To the memory of CHARLES WATSON,

Vice-admiral of the white, commander in chief of his majesty’s naval forces in the East Indies, who died at Calcutta the sixteenth of August, 1757.

The EAST-INDIA Company

As a grateful testimony of the signal advantages which they obtained by his valour and prudent conduct, caused this monument to be erected.

The next monument worthy of notice, is that of Sir Charles Wager. The principal figure here is that of Fame holding a portrait of Sir Charles in relief, which is supported by an infant Hercules. The enrichments are naval trophies, instruments of war and navigation. On the base is represented, in relief, the destroying and taking the Spanish galleons in 1708. The inscription is as follows:

To the memory of Sir George Wager, Knt.

Admiral of the white, first commissioner of the admiralty,
And privy counsellor.

A man of great natural talents.

He bore the highest commands,

And passed through the greatest employments,

With credit to himself, and honour to his country.

He was in private life

Humane, temperate, just, and bountiful:

In public station

Valiant, prudent, wise, and honest:

Easy of access to all:

Plain and unaffected in his manners,

Steady and resolute in his conduct:

So remarkably happy in his presence of mind,

That no danger ever discomposed him;

Esteemed and favoured by his king,

Beloved and honoured by his country,

He died 24th May 1743, aged 77.

Admiral VERNON.

On a pedestal of beautiful marble is a bust of that gallant admiral, with a fine figure of Fame crowning him with laurels. This monument is elegantly ornamented with naval trophies. Beneath is the following inscription:

As a memorial of his own gratitude,
and of the virtues of his benefactor,

this monument was erected by his nephew
Francis lord Orwell,
In the year
1763.

Sacred to the memory
of

EDWARD VERNON,
Admiral of the White Squadron
of the British fleet.

He was the second son of James Vernon,
Who was secretary of state to king William III.
and whose abilities and integrity
Were equally conspicuous.

In his youth he served under the admirals Shovell & Rooke;
By their example he learned to conquer,
By his own merit he rose to command.

In the war with Spain of M,DCC,XXXIX,
he took the fort of Porto Bello
with six ships,

A force which was thought unequal to the attempt.
For this he received

the thanks of both houses of parliament.

He subdued Chagre, and at Carthage
conquered as far as naval force
could carry victory.

After these services he retired,
without place or title,
from the exercise of public
to the enjoyment of private

virtue.

The testimony of a good conscience
was his reward,

The love and esteem of all good men
his glory.

In battle; tho' calm he was active, & tho' intrepid prudent,
successful, yet not ostentatious,

Ascribing the glory
to God.

In the senate, he was disinterested, vigilant, and steady.

On the XXX. day of October M,DCC,LVII.

he died as he had lived,
the friend of man, the lover of his country,
the father of the poor,
aged LXXIII.

On the other side of the north cross is a grand monument erected to the memory of John Hollis, duke of Newcastle, by his daughter the countess of Oxford. This is perhaps the loftiest and most costly of any in the abbey: a pediment is supported by beautiful columns of variegated marble; the duke is represented resting upon a sepulchral monument, holding in his right hand a general's staff, and in his left a ducal coronet. On one side of the base stands a statue of Wisdom, and on the other of Sincerity. On the angles of the other compartments sit angels, and on the ascending sides of the pediment two cherubs, one with an hour-glass, alluding to the admeasurement of human life by grains of sand; the other pointing upwards, where life shall no longer be measured by hours and minutes. On the base is an inscription, enumerating his grace's titles and several employments; his marriage and issue; and informing us, that he was born on the ninth of January, 1661-2, and died on the fifteenth of July, 1711.

The monument of William Cavendish, duke of Newcastle, is also very pompous, but in the old taste. Under a rich canopy of state lie, as the inscription expresses it, "The loyal duke of Newcastle and his dutchess, his second wife, by whom he had no issue: her name was Margaret Lucas, youngest sister of lord Lucas of Colchester, a noble family; for all the brothers were valiant, and all the sisters virtuous. The dutchess was a wife, witty, and learned lady, which her many books do well testify: she was a most virtuous, and a loving and a careful wife, and was with her lord all the time of his banishment and miseries; and when he came home, never parted from him in his solitary retirements." Besides the above inscription, there is another in Latin, which enumerates his titles and employments; and observes, that, for his fidelity to king Charles I. he was made captain-general of the forces

raised for his service in the north, fought many battles, and generally came off victorious; but when the rebels prevailed, knowing himself to be one of the first they designed to sacrifice, he left his estate, and endured a long exile. It then gives his issue by his first wife; and concludes with observing, that he died on the twenty-seventh of December 1676, in the eighty-fourth year of his age.

The next monument, worthy observation, is that erected to the memory of Sir Peter Warren. It is a very elegant piece in white marble, done by the famous Roubiliac. Close to the wall is a large flag, hanging on a flag-staff, and spreading in very natural falls behind the whole monument: before it is a fine figure of Hercules, placing Sir Peter's bust on its pedestal; and on the other side Naval Victory, with a laurel wreath in her hand, is seated gazing on the bust of Melancholy, mixed with admiration: behind her a cornucopia pours out fruit, corn, the fleece, &c. and by it is a cannon, an anchor, and other decorations. The inscription is as follows:

Sacred to the memory
Of Sir Peter Warren,
Knight of the Bath,
Vice-admiral of the Red Squadron
Of the British fleet,
And member of parliament
For the city and liberty of Westminster.

And a little lower:

He derived his descent from an ancient family of Ireland,
His fame and honours, from his virtues and abilities.

How eminently these were displayed,

With what vigilance and spirit they were exerted,
In the various services wherein he had the honour to command,

And the happiness to conquer,

Will be more properly recorded in the annals of
Great Britain.

On this tablet, Affection with truth may say,

That deservedly esteemed in private life,

And universally renowned for his public conduct,

The judicious and gallant officer

Possessed all the amiable qualities of the friend,

The gentleman, and the christian.

But the Almighty,

Whom alone he feared,

And whose gracious protection he had often experienced,
Was pleased to remove him from a life of honour

To an eternity of happiness,

On the 20th day of July 1752, in the 49th year of his age.

On the bottom of the base:

Susannah, his afflicted wife, caused this monument
to be erected.

The monument erected to Hugh Chamberlayne, M. D. was some years ago esteemed one of the best pieces in the abbey, but it is now eclipsed by several. The principal figure lies as it were at ease upon a tombstone, leaning upon his right arm, with his hand upon his night-cap, and his head uncovered. In his left hand he holds a book, to indicate his intense application to study. On each side is a beautiful statue, one representing Phyc, and the other Longevity; and over his head is Fame descending with a trumpet in one hand, and a wreath in the other. On the top are weeping cherubs, and on the pedestal a long Latin inscription, which mentions his great knowledge and industry in his profession, his humanity in relieving the sick, and his affinities and connections in social and private life. He died on the seventeenth of June, 1728, aged sixty-four.

The tomb of Almericus de Courcy, baron of Kingsale, in Ireland, is ornamented with the figure of his lordship in armour, reposing himself, after the fatigues of an active life, under a gilded canopy. The inscription shows, that he was descended from the famous John de Courcy, earl of Ulster, who, in the reign of king John, obtained, in consideration of his great valour, the extraordinary privilege for him and his heirs, of being covered in the king's presence. Almericus de Courcy died on the ninth of February, 1719, aged fifty-seven.

We now come to the grand and magnificent monument of the great Sir Isaac Newton, whose statue is formed recumbent, leaning his right arm on four folios, intituled, Divinity, Chronology, Optics, and Phil. Prin. Math. and pointing to a mathematical diagram, supported by cherubs. Over him is a large globe, projecting from a pyramid behind, whereon is delineated the course of the comet in 1680, with the signs, constellations, and planets. On this globe sits the figure of Astronomy, with her book closed, in a very thoughtful, composed, and pensive attitude. Beneath the principal figure is a very fine bas relief, representing the various labours in which Sir Isaac chiefly employed his time; such as discovering the effects of gravitation, settling the principles of light and colours, and reducing the coinage to a determined standard. The inscription on the pedestal is in Latin, short, but full of meaning; it intimates, that, by a spirit nearly divine, he explained, on principles of his own, the motion and figure of the planets, the paths of the comets, and the ebbing and flowing of the sea; that he discovered the dissimilarity of the rays of light, and the properties of colours flowing from thence, which none but himself had ever dreamed of; that he was a diligent, sagacious, and faithful interpreter of nature, antiquity, and the holy scriptures; that, by his philosophy, he maintained the dignity of the Supreme Being; and by the purity of his life, the simplicity of the gospel. It concludes with the just exclamation, What reason have mortals to pride themselves in the existence of so great an ornament of the human race! He was born on the twenty-fifth of December, 1642, and died in 1726. So noble a monument erected to real merit, is a greater ornament to the nation, than to the great genius to whom it was raised; and in this light it is viewed by all Europe.

On the other side of the entrance into the choir, is another lofty and pompous monument, erected to the memory of earl Stanhope, who is also represented leaning on his arm, in a recumbent posture, holding in his right hand a general's staff, and in his left a parchment scroll. Before him stands a Cupid resting on a shield. Over a martial tent sits Minerva, holding in her right hand a javelin, and in the other a scroll. Behind is a slender pyramid; on the middle of the pedestal two medallions, and one on each side the pilaster. Beneath the principal figure is an inscription, displaying the merits of this great man, as a soldier, a statesman, and a senator; observing, that in 1707, he concluded an advantageous peace with Spain; and the same year was sent ambassador to Charles III. In 1708, he took Port-Mahon: in 1710, he forced his way to the gates of Madrid, and took possession of that capital: in 1715, being a member of the secret committee, he impeached the duke of Ormond: in 1717, he was made first commissioner of the treasury, and chancellor of the exchequer; and in July following, was created a peer. He died in 1721, in the forty-seventh year of his age.

Mr. Thynne's monument has always been esteemed a very fine one. That gentleman is represented dying, and at his feet is a boy weeping. Underneath, on a tablet of black marble, in white letters, is this short inscription:

"Thomas Thynne, of Longleate, in Com. Wilts, Esq; who was barbarously murdered on Sunday the twelfth of February, 1682."

And on the pedestal, the story of his murder is finely represented in relief.

This murder was conspired by count Koningmark, and executed by three assassins, hired for that purpose, who shot this unhappy gentleman as he was passing through Pall-Mall in his own coach. The motive was to obtain the rich heiress of Northumberland in marriage, who, in her infancy, had been betrothed to the earl of Ogle, but left a widow before consummation, and afterwards married to Thomas Thynne; but being scarce fifteen, and her mother extremely tender of her, prevailed upon her husband to travel another year before he bedded her, in which time she became acquainted with Koningmark, at the court of Hanover. Whether she ever gave him any countenance, is uncertain; but

having no hopes of obtaining her while her husband lived, he accomplished his death in this villainous manner. The lady, however, detested this base and inhuman conduct, and soon after married the great duke of Somerset.

The monument of dame Grace Gethin is ornamented with a lady devoutly kneeling, with a book in her right hand, and her left upon her breast: on each side is an angel, one holding over her head a crown, and the other a chaplet; and on the ascending side of the pediment are two female figures in a mournful posture. It is adorned with three different coats of family arms, and on the base is an English inscription, which informs us, that she was married to Sir Richard Gethin Grott, in Ireland; was famous for her exemplary piety, and wrote a book of devotions, which Mr. Congreve has complimented with a poem. She died on the eleventh of October, 1697, aged twenty-one years.

At a small distance, is a large monument of black marble, erected to the memory of Sir Thomas Richardson, lord chief justice of England in the reign of king Charles I. He died in 1634, and his tomb is adorned with his effigy, in brass, lying in his robes, and his collar of SS.

The next is an ancient monument, raised to the memory of William Thynne of Batterville, Esq. It is of marble and alabaster gilt, and adorned with the statue of that gentleman, lying at full length. The inscription informs us, that he was a polite gentleman, a great traveller, and a brave soldier; and that he died on the fourteenth of March, 1584.

Having surveyed the principal monuments in the open part of Westminster Abbey, we now proceeded to those which are in the several chapels round this ancient pile. There are ten of these chapels round that of St. Edward the Confessor, which stands as it were in the centre, and is inclosed in the body of the church, at the east end of the choir behind the altar.

ST. EDWARD'S CHAPEL.

The first curiosity that here fixes our attention, is the ancient shrine erected by Henry III. on the canonization of Edward king of England, the third of that name before the conquest, and the last of the Saxon race; a prince who owed the title of saint and confessor rather to the vast sums he bestowed upon the church, and the solicitation of the monks, than to his personal merit; for he was a bad son, a bad husband, and so bad a king, that he shewed greater favour to the Normans than to his own people, and by his folly prepared the way for the conquest. He died in 1066, and was canonized by pope Alexander III. in 1269. This shrine, which was once esteemed the glory of England, is now greatly defaced and neglected. It was composed of stones of various colours, beautifully enriched with all the cost that art could devise. It was no sooner erected, than the wealth of the kingdom flowed to it from all quarters. Henry III. set the first example, though he afterwards made use of the jewels and treasure he offered there, to defray the charges of an expedition into France. Before this shrine was a lamp kept continually burning; on one side stood a silver image of the Holy Virgin, which, with two jewels of immense value, were presented by queen Eleanor, the wife of Henry III. On the other side stood another image of the Virgin Mary, wrought in ivory, presented by Thomas Becket, archbishop of Canterbury. Here also Edward I. offered the Scots regalia and chair, in which the kings of Scotland used to be crowned, and which is still preserved, and shewn to all strangers. About the year 1280, Alphonso, third son to Edward I. offered the golden coronet of Llewellyn, prince of Wales, and other jewels: but it would almost fill a volume to enumerate the offerings made at this shrine. Yet it is now so stripped, as to afford satisfaction only to the curious. However, some of the stone-work, with which it was adorned, is still to be seen. This stone-work is hollow within, and now incloses a large chest, which Mr. Keep, soon after the coronation of James II. found to contain the remains of St. Edward; for it being broken by accident, he discovered

covered a number of bones, and turning them up, found a crucifix, richly ornamented with a gold chain of twenty inches long; both which he presented to his majesty, who ordered the bones to be replaced in the old coffin, and inclosed in a new one, made very strong, and clamped with iron.

On the north side of this chapel is the tomb of Henry III. the pannels of which are of polished porphyry, and around them mosaic work of gold and scarlet. At the corners of the table are twisted pillars, gilt, and enamelled; and upon them is placed the effigy of that king in brass gilt, finely executed. He died in 1277, aged sixty-five, after a troublesome reign of fifty-six years.

At the feet of this prince lies the effigy of Eleanor, queen to Edward I. and on the sides of the monument are engraved the arms of Castile and Leon, quarterly, and those of Panthieu hanging on vines and oak-trees, and round the copper verge is embossed the following inscription in Saxon characters:

*Icy gylt Alianor Fadis Reyne de Angleterre,
Femme al. Re. Edward Fiz.*

That is,

Here lies Eleanor, once queen of England,
Wife to king Edward.

There is also here a large plain coffin of grey marble, composed of seven stones, four of which form the sides, two the ends, and one the cover. This rough, unpolished tomb, incloses the body of the glorious king Edward I. who was born on the seventeenth of June, 1239. He was named Edward in honour of Edward the Confessor, and afterwards, from his tall and slender habit of body, surnamed Long Shanks. This brave prince died on the seventh of July 1307, in the sixty-ninth year of his age.

In this chapel is also a tomb erected to the memory of Philippa, the third daughter of William earl of Hainault, and queen to king Edward III. who bestowed a profusion of expence upon her tomb, round which were placed, as ornaments, brazen statues of no less than thirty kings, princes, and noble personages, her relations.

Though Edward III. was interred in the same grave as the queen, he has a monument erected to him adjoining to her's, covered with a Gothic canopy. The effigy of this king, who died June twenty-first, 1377, lies on a tomb of grey marble, and at his head are placed the shield and sword carried before him in France. The latter is seven feet long, and weighs eighteen pounds. The tomb was, like the former, surrounded with statues, particularly with those of his children.

Next to this is the tomb of Richard II. and his queen, over which is a canopy of wood, remarkable for a painting of our Saviour and the Virgin Mary, still visible. This prince was murdered on Valentine's day, 1399, and on the robing of his effigy are curiously wrought peascod shells open, and the peas out; perhaps in allusion to his being once in full possession of sovereignty, which, before his murder, was reduced to an empty title.

HENRY THE FIFTH'S CHAPEL

Is separated from that of St. Edward by an iron screen, on each side of which there are statues as large as life. His monument, which is surrounded by iron rails and gates, is of black marble, and upon it is placed his statue; but what is very remarkable, it lies without the head. Your guides tell you, that the head, being of beaten silver, as well as the sceptre and other ensigns of royalty, with which the statue was once adorned, occasioned their being sacrilegiously taken away: but this is, by some writers, represented as a ridiculous tale. Over this tomb is a chauntry chapel, in which the weapons, armour, and caparisons of Henry V. were carefully laid up, and remain to this day. Near this tomb lie inclosed, in an old wooden chest, the remains of Catharine, daughter of Charles VI. king of France, and consort to Henry V. She died on the second of January 1437, and was honourably interred in the chapel erected by Henry III. but when her grandson, Henry VII. pulled down that edifice, to erect his own cha-

pel; the bones appeared firmly united, and thinly covered with flesh; but the coffin being decayed, was put into a wooden chest, and removed to the place where it is now seen. This is the account given by those who shew this venerable dust, the miserable remains of a lady of royal blood, and distinguished beauty.

THE CHAPEL OF ST. ANDREW.

In the centre of this chapel is a magnificent monument erected to the memory of Sir Francis Norris, ancestor to the late Sir John Norris. He distinguished himself in the Low Countries, by his bravery, during the reign of queen Elizabeth, and was created lord Norris of Rycot. This monument has a fine representation of an encampment, in relief, and is otherwise beautifully ornamented; but has no inscription.

Against the wall is a table-monument, to the memory of Sir John Burgh, who was killed in 1692, in taking a large Spanish ship, laden with gold, silver, and jewels, of an inestimable value. But the most remarkable piece in this chapel is the monument of Joseph Gascoigne Nightingale, Esq.

ST. MICHAEL'S CHAPEL.

Here is only one monument worthy of notice, which is that of Sarah, dutchess of Somerset, and mother to the last duke of that branch of the family. On the base sit two charity-boys, one on each side, lamenting the loss of their great benefactress, who is represented resting on her arm, under a canopy of state, and looking earnestly on a group of cherubs issuing from the clouds above her. Underneath is a Latin inscription, enumerating her many charitable foundations, and informing us, that this excellent lady died on the fifth of September, 1692.

ST. JOHN THE EVANGELIST'S CHAPEL.

In the centre is a curious monument to the memory of Sir Francis Vere, a gentleman of the first reputation for learning and bravery, who particularly distinguished himself at the battle of Nieuport, at which he commanded in front, under prince Maurice, in the service of the States, against the Spaniards. This great warrior was thirty years in the Dutch service, and during twenty of them, commanded the auxiliary troops of England. He died on the twenty-eighth of August 1608, in the fifty-seventh year of his age. His monument is a table, supported by four knights, kneeling, on which lie the several parts of a complete suit of armour, and underneath the effigies of Sir Francis, in a loose gown, on a quilt of alabaster. On the base is a short Latin inscription, in gold letters, shewing to whom it belongs; and informing us, that he was nephew to the earl of Oxford, and governor of Portsmouth and the Brille, and that his disconsolate widow consecrated this monument to his memory.

Close to the wall is a monument of Sir George Hollis, nephew to Sir Francis Vere, and a major-general under him. On the pedestal is represented the siege of a town, in relief, where the principal figure is a general on horseback, holding a battoon, and having one eye blemished; perhaps alluding to the siege of Nieuport, in which Sir George also gained great honour, and had a horse killed under him. On each side of this pedestal sits a Pallas, lamenting the death of the great warrior, who is represented above in a Roman habit, standing erect upon a lofty altar, with a cherub supporting the plinth on which he stands. Sir George died in January 1626. An ingenious author, speaking of this monument, says, that Sir George was the first erect figure set up in the abbey: "An attitude, continues he, which I am far from discommending; for, it is my opinion, statues should always represent life and action. It is peculiarly adapted to heroes, who ought never to be supposed at rest, and should have their characters represented as strong as possible: this before us is bold and manly, though not chaste and elegant: it is finely elevated too, and the mourning Pallasses at the base of it are both well fancied and well applied."

Near the tomb of Sir Francis is that of Aubery de Vere, the last earl of Oxford of that name, and lieutenant-

tenant-general of queen Anne's forces, who died on the twelfth of March, 1702.

In this chapel are also some antique monuments; particularly on the right hand is that of John de Eastney, one of the abbots, who was a great benefactor to this church, and died on the fourth of May 1438. A brazen statue of this abbot, in his mass-habit, lies upon his tomb. It is remarkable, that in breaking up a grave about thirty years ago, his body was discovered in a coffin, quilted with yellow fatten, having on a gown of crimson silk, girded round him with a black girdle; on his legs were white silk stockings, and over his face a clean napkin, folded up, and laid corner-wise. His body and legs are said to have been plump and firm, but his face somewhat discoloured.

ST. ERASMUS'S, or ISLIP'S CHAPEL.

Here are only two monuments worthy of notice: the first, that of John Islip, abbot of Westminster, and founder of this chapel, which he dedicated to St. Erasmus. It is adorned with a great deal of carving, in devices, intaglios, and rebuses, alluding to the name of the founder; as, a person slipping boughs off a tree; an eye, with the slip of a tree; and a boy, sliding from a bough, with *I slip*, in a label, proceeding out of his mouth. In the middle is Islip's tomb, which is a plain marble table, supported by four small brass pillars: over it was anciently painted on the roof, a picture of our Saviour on the cross. Islip died in January 1510.

The other tomb is that of Sir Christopher Hatton, son to Christopher Hatton, lord chancellor of England, and his lady. The principal figures are, a knight in armour, and a lady in deep mourning, resting on the ascending sides of a triangular pediment, parted in the middle by a trunkless helmet. Over their heads, is a neat piece of architecture, in the centre of which is a scroll, with their arms, supported by naked boys, one of whom holds an extinguished torch reversed over the knight, to shew that Sir Christopher died first: the other, over the lady, holds his torch upright, and burning, to signify that she survived him. The inscription informs, that Sir Christopher died on the tenth of September 1619.

Over this chapel is a chantry, in which are two large wainscot presses, filled with the effigies of princes, and others of high quality, interred in the abbey. These effigies are said to resemble the deceased as near as possible; and were formerly exposed at the funerals of our princes and other great personages, in open chariots, with their proper ensigns of royalty and honour. Those here deposited are all maimed, some stripped, and others in tattered robes; but the most ancient are the least injured; which seems to indicate, that the value of their robes had occasioned this injury; for those of Edward VI. which were once of crimson velvet, but now appear like leather, are left entire; while others, particularly James I. are totally stripped of every thing of value. With regard to the effigy of queen Elizabeth, which was, like the rest, stripped of her robes, it has been lately fresh painted, and elegantly dressed, and now makes a very beautiful appearance.

On the east side of the door of this chapel is a monument lately erected to the memory of admiral Holmes, which is a figure representing the admiral in a Roman warlike habit, with his right hand resting on a cannon mounted on a carriage. Behind is an anchor, a flag-staff, and other naval decorations, &c. Beneath is the following inscription:

“To the memory of Charles Holmes, Esq; rear-admiral of the White. He died the twenty-first of November 1761, commander in chief of his majesty's fleet stationed at Jamaica, aged fifty. Erected by his grateful nieces, Mary Stanwix and Lucretia Sowle.”

ST. JOHN BAPTIST'S CHAPEL.

This chapel contains several monuments: one at the entrance is to the memory of Mrs. Mary Kendall, the daughter of Thomas Kendall, Esq. She died in her thirty-third year, and her epitaph informs us, that “her many virtues rendered her every way worthy of

“that close union and friendship, in which she lived with lady Catharine Jones; and in testimony of which, she desired that even their ashes, after death, might not be divided; and therefore ordered herself here to be interred; where she knew that excellent lady designed one day to rest, near the grave of her beloved and religious mother, Elizabeth countess of Kendall.”

Next to this is a monument erected to the memory of colonel Edward Popham, and his lady, whose statues, in white marble, stand under a lofty canopy, resting their arms in a thoughtful posture, upon a marble altar, on which lie the gloves of an armed knight. This gentleman was an active officer in Cromwell's army, and his achievements were here inscribed on his tomb. Upon the restoration, the monument was ordered to be demolished, and the inscription erased; but at the intercession of some of his lady's relations, who had eminently served his majesty, the stone whereon the inscription was cut; was only turned inwards, and no other injury done to his monument.

In the midst of this chapel is a large table monument for Thomas Cecil, earl of Exeter, baron Burleigh, knight of the garter, and privy counsellor to king James I. whereon is placed his statue lying down, with his lady on his right side, and a vacant space on his left for another. The lady on his right side is his first wife, the lady Dorothy Nevil, daughter to the lord Latimer; and the vacant space was left for his second wife, Frances Bridges, of the noble family of Chandos; but as the right side was taken up, she gave express orders in her will, not to place her effigy on his left: however, according to the inscription, they are all buried together in one vault.

But the most magnificent monument in this chapel is against the east wall, where stood the altar of St. John Baptist: this was erected to the memory of Henry Carey, first cousin to queen Elizabeth, who, on being denied the honours of peerage, laid the disappointment so much to heart, that he languished for a long time on a sick-bed, at which the queen being moved too late, created him a baron, and ordered the patent and robes to be laid before him, but without effect. He died on the twenty-third of July 1596, aged seventy-two.

Here also is a monument to Thomas Carey, second son to the earl of Monmouth, who is said to have died of grief in 1648, at the age of thirty-three, on account of the untimely fate of his royal master, king Charles I.

Here are likewise a few antique monuments, particularly one in which the figure of a bishop, properly habited, lies under a Gothic canopy. This is supposed to be erected for Thomas Rathal, bishop of Durham, who died in 1524.

And an ancient stone monument for William of Colchester, whose effigies lie with the head supported by an angel, and the feet by a lamb.

ST. PAUL'S CHAPEL.

On the left hand, a lofty monument erected to the memory of Sir John Puckering, Knt. and lord chancellor in the reign of queen Elizabeth, in which office he died on the twentieth of April, 1596. His epitaph in Latin over his effigies, is thus translated:

The public care and laws engag'd my breast,
To live was toilsome, but to die is rest;
Wealth, maces, guards, crowns, titles, things that fade,
The prey of time and fable death are made.

VIRTUE INSPIRES MEN.

His wife this statue rears to her lov'd spouse,
The test of constancy and marriage vows.
I trust I shall see the Lord in the land of the living.

Adjoining to this monument is one much decayed, for Sir James Fullerton and his lady, whose effigies lie upon it, and on a table of black marble is the following quaint inscription:

“Here lie the remains of Sir James Fullerton, Knt. first gentleman of the bedchamber to king Charles I. (prince and king) a generous rewarder of all virtue, a severe

severe reprover of all vice, a professed renouncer of all vanity. He was a firm pillar to the commonwealth, a faithful patron to the Catholic church, a fair pattern to the British court. He lived to the welfare of his country, to the honour of his prince, to the glory of his God. He died fuller of faith than of fear, fuller of resolution than of pain, fuller of honour than of days."

There is a monument erected to the memory of Sir James Bromley, chancellor to queen Elizabeth, who died on the twelfth of April 1587. This monument is of alabaster, with pillars of Lydian marble gilt, and Sir James is represented lying in his chancellor's habit, with his four sons and four daughters kneeling on the base.

In the same chapel is a plain monument of Sir Dudley Carlton, who for his services to king James I. and king Charles I. was made viscount Dorchester, and secretary of state. He died on the fifteenth of February 1631, and is represented on his tomb sitting in a half-raised posture.

To the east of this monument is another of alabaster, to the memory of Frances, the wife of Thomas Ratcliffe, earl of Suffex, who distinguished herself by her humanity and generosity, and died on the fifteenth of April 1589. She is represented in a recumbent posture, resting on an embroidered cushion, dressed in robes, and with a coronet on her head.

Next to this is the monument of Francis lord Cottington of Hanworth, who died on the ninth of June 1652, and of his lady, who died in 1633. This monument is of black touchstone, and remarkably different from every other in the abbey. On the top is a circular frame of gilt brass, enclosing the bust of the lady; and beneath is his lordship on a table monument, resting on his left arm; and over a satyr's head is the inscription in English, mentioning his lordship's titles and employments.

HENRY THE SEVENTH'S CHAPEL.

This chapel, which was founded by Henry VII. in the year 1502, and the succeeding years, is styled by Leland the wonder of the world. It is situated to the east of the abbey, to which it is so neatly joined, that, on a superficial view, it appears to be one and the same building. It is supported by fourteen Gothic buttresses, all beautifully ornamented, and projecting from the building in different angles, and is enlightened by a double range of windows, that throw the light into such a happy disposition, as at once to please the eye, and afford a kind of solemn gloom. These buttresses extend up to the roof, and are made to strengthen it by their being crowned with Gothic arches. In these buttresses are niches, in which formerly stood a number of statues; but these being greatly decayed, have been long taken down.

This chapel is one of the most expensive remains of the ancient English taste and magnificence; there is no looking upon it without admiration: yet, perhaps, its beauty consists much more eminently in the workmanship than the contrivance. The plate shews the outside, where it joins to the abbey, and gives some idea of the fine taste of Gothic architecture in that age, which seems to have been its meridian; but it soon fell into the bad taste practised in the time of queen Elizabeth, as may be seen in the tomb of this queen and her predecessor in the side-issles of this chapel.

This may be sufficient for the outside of this edifice, the entrance to which is from the east end of the abbey, by a flight of steps of black marble, under a very noble arch that leads to the gates opening to the body or nave of the chapel: for, like a cathedral, it is divided into a nave and side-issles, to which you may enter by a door on each hand. The gates at the entrance of the nave are of brass curiously wrought in the manner of frame-work, and have in every other open pannel a rose and portcullis alternately.

Being entered, the eye is naturally directed to the lofty ceiling, in the most admirable manner wrought with such an astonishing variety of figures, as is impossible to be described. The stalls on each side are of oak, with Gothic canopies, most beautifully carved, as are also the seats; and the pavement is of black and

white marble, laid at the charge of Dr. Killigrew, once prebendary of this abbey. The east view from the entrance presents you with the brass chapel and tomb of the founder, which will be hereafter described; and round it, where the east end forms a semicircle, are the chapels of the dukes of Buckingham and Richmond. At that end the side-issles open to the nave. It must not be omitted, that the walls, both of the nave and the side-issles, are adorned with the most curious imagery imaginable, and contain an hundred and twenty statues of patriarchs, saints, martyrs, and confessors, under which are angels supporting imperial crowns, besides innumerable small ones, all of them esteemed so curious, that the best masters are said to have travelled from abroad to copy them. The roof of the side-issles is flat, and supported on arches between the nave and side-issles, turning upon twelve stately Gothic pillars, curiously adorned with figures, fruitage and foliage. The windows, besides a spacious one at the east end, are thirteen on each side above, and as many below, and were formerly painted, having in each pane a white rose, the badge of the house of Lancaster, the initial letter of the founder's name, or portcullises crowned, the badge of the Beaufort family, of which there are some now remaining.

This chapel was originally designed as a sepulchre, appropriated solely to the use of those of royal blood; and so far has the will of the founder been observed, that none have been yet interred there, but those of high quality, whose descent may generally be traced from some of our ancient kings: I shall therefore mention each of these tombs, beginning with that which is the most ancient, as well as the most astonishing.

It has been already observed, that in the middle of the east end of the nave is situated the magnificent tomb of Henry VII. This is inclosed with a screen of cast brass, most admirably designed and executed: this screen is nineteen feet in length, eleven in breadth, and the same in height. It is ornamented with statues, of which those only of St. James, St. Bartholomew, St. George, and St. Edward, are now remaining; and also adorned with other devices alluding to king Henry VII.'s family, as portcullises, signifying his relation to the Beauforts by his mother's side; roses twisted and crowned, in memory of the union of the two houses of Lancaster and York, by his marriage; and at each end a crown in a bush, alluding to the crown of Richard III. found in a hawthorn bush near Bosworth field, where the famous battle was fought in which Richard lost his life. Within the rails are the effigies of the royal pair, in their robes of state, on a tomb of black marble, the head whereof is supported by a red dragon, the ensign of Cadwallader, from whom king Henry VII. was fond of tracing his descent, and the foot by an angel.

At the head of this tomb lie the remains of Edward VI. grandson to Henry VII. who died in the sixteenth year of his age, and the seventh of his reign. A fine monument was erected to his memory by queen Mary, his sister and successor; it was adorned with curious sculpture representing the passion and resurrection of our Saviour, with two angels on the top kneeling, and the whole elegantly finished; but it was afterwards demolished as a relic of popish superstition.

On one side of Henry VII.'s tomb, is a small chapel, in which is the monument of Lewis Stuart, duke of Richmond, and Frances his wife; whose statues, in cast brass, are represented lying on a marble table, under a canopy of brass curiously wrought, and supported by the figures of Faith, Hope, Charity, and Prudence; and on the top is a figure of Fame taking her flight, and resting only on her toe.

On the north side of Henry VII.'s tomb is a monument decorated with several emblematical figures in brass gilt; the principal is Neptune in a pensive posture, with his trident reversed, and Mars, with his head crushed: these support the tomb, on which lie the effigies of George Villars, duke of Buckingham, the great favourite of king James I. and king Charles I. who fell a sacrifice to the national resentment, by the hand of Felton. His grace married Catharine, daughter to the earl of

Rutland, who erected this monument to his memory, and lies in effigy on the same tomb by his side. The Latin inscription, after recounting his noble qualities and high titles, alludes to the story of his death.

Of a later date, and superior in point of design and workmanship, is a noble monument erected to the memory of John Sheffield, duke of Buckingham, where his grace's statue, in a Roman habit, is laid, in a half raised posture, on an altar of fine marble: his dutchess is represented standing at his feet, weeping. On each side are military trophies; and over all an admirable figure of Time, holding several medallions representing the heads of their graces children. This monument is very justly admired. It has been observed, that the duke himself appears the principal figure in the group; and though he lies in a recumbent posture, and his lady is in the most beautiful manner placed at his feet, yet her figure is so characterized, as to be only a guide to his, and both reflect back a beauty on each other. The decorations are allowed to be extremely picturesque and elegant; the trophies at his head, the figure of Time above, with the medallions of his children, fill up all the spaces with such propriety, that little could be added, and nothing appears superfluous. The inscription sets forth the duke of Buckingham's pofts, and his qualifications as a good poet, and a fine writer; and over his statue is inscribed in Latin sentences to the following purpose:

I lived doubtful, not dissolute.

I die unresolved, not unresigned.

Ignorance and error are incident to human nature.

I trust in an Almighty and All-good God.

Thou King of Kings, have mercy upon me.

And underneath:

For my king often, for my country always.

His grace died in the fifty-seventh year of his age, February twenty-fourth, 1720, leaving the publication of his works to the care of Mr. Pope. He had three wives; the first, Ursula, countess of Coventry; the second, Catharine, countess of Gainsborough; the third, Catharine, countess of Anglesey.

In this isle there is a lofty pyramid supported by two griffins of gilt brass, on a pedestal of the most curious marble, erected to the memory of Charles Montague, marquis of Halifax, son to George Montague of Horton. He was placed at the head of the treasury in the reign of king Charles I. and undertaking the reformation of the coin, which was then most infamously clipped, he restored it to its proper value. For this, and other public services, he was first created baron, and then marquis of Halifax.

Against the east wall, at the end of the north isle, is a monument in the form of a beautiful altar, raised by king Charles II. to the memory of Edward V. and his brother Richard, on which is an inscription in Latin, to the following purport:

"Here lie the reliques of Edward V. king of England, and Richard duke of York, who being confined in the Tower, and there stifled with pillows, were privately and meanly buried, by order of their perfidious uncle, Richard the usurper. Their bones, long enquired after and wished for, after lying two hundred and one years in the rubbish of the stairs, lately leading to the chapel of the White Tower, were, on the seventeenth of July 1674, by undoubted proofs, discovered, being buried deep in that place. Charles II. pitying their unhappy fate, ordered these unfortunate princes to be laid amongst the reliques of their predecessors, in the year 1678, and the twentieth of his reign."

At the east end of the same isle is a vault, in which are deposited the bodies of king James I. and Anne his queen, daughter to Frederick II. king of Denmark.

Over this vault is a small tomb, adorned with the figure of a child, erected to the memory of Mary, the third daughter of James I. who was born at Greenwich in 1605, and died at two years old.

There is also another monument, on which is the representation of a child in a cradle, erected to the memory of Sophia, the fourth daughter of the same king,

who was born at Greenwich in 1606, and died three days after.

In the same isle is a lofty monument, erected to the memory of queen Elizabeth by king James I. her successor. The inscription represents her character, high descent, and the memorable acts of her glorious reign. "That she was the mother of her country, and the patroness of religion and learning; was herself skilled in many languages, adorned with every excellence of mind and person, and endowed with princely virtues beyond her sex: that in her reign religion was refined to its original purity; peace was established; money restored to its just value; domestic insurrections quelled; France delivered from intestine troubles; the Netherlands supported; the Spanish Armada defeated; Ireland, almost lost by the secret contrivances of Spain, recovered; the revenues of both universities improved by a law of provisions; and, in short, all England enriched. That she was a most prudent governess, forty-five years a virtuous and triumphant queen; truly religious, and blest in all her great affairs; and that after a calm and resigned death in the seventieth year of her age, she left her mortal part to be deposited in this church, which she established upon a new footing, till by the word of Christ she is called to immortality." She died on the twenty-fourth of March 1602.

In the south isle is a lofty and pompous tomb, erected to the memory of Mary queen of Scots, the mother of king James I. who flying into England from her rebellious subjects, was taken prisoner, tried and condemned, for conspiring the death of queen Elizabeth; and on the eighth of February 1587, beheaded on a scaffold erected in the hall of Fotheringhay Castle, in Northamptonshire. She was afterwards pompously interred, by order of queen Elizabeth, in the cathedral church of Peterborough; but upon the accession of her son to the throne of England, he ordered her remains to be removed from thence, and placed near this monument.

Near the last monument is a tomb enclosed with iron rails, on which lies a lady, also finely robed, the effigy of Margaret Douglas, daughter of Margaret queen of Scots by the earl of Angus. Her son, the lord Darnely, father to king James I. is represented foremost on the tomb kneeling, with the crown over his head, and there are seven other of her children represented round the tomb. This great lady, though she herself never sat on the throne, had, according to the English inscription, king Edward IV. to her great grandfather; Henry VII. to her grandfather; Henry VIII. to her uncle; Edward VI. to her cousin-german; James V. of Scotland to her brother; Henry I. of Scotland to her son; James VI. to her brother. Having to her great grandmother and grandmother two queens, both named Elizabeth; to her mother, Margaret queen of Scots; to her aunt, Mary, the French Queen; to her cousins-german, Mary and Elizabeth, queens of England; and to her niece and daughter-in-law, Mary Queen of Scots. This great lady died on the tenth of March, 1577.

In the south side is likewise the monument of Margaret countess of Richmond, mother to Henry VI. by her first husband, Henry Tudor. She was afterwards married to Humphry Stafford, a younger son to Humphry duke of Buckingham, and at last to Thomas lord Stanley, earl of Derby; but by the two last had no children. The inscription mentions the charities of this humane and generous princess, particularly her founding two colleges at Oxford, Christ-church and St. John's; and a grammar-school at Winbourne. She died in July 1509, in the reign of her grandson, Henry VIII.

At the east end of this isle is the royal vault of king Charles II. king William III. queen Mary, his consort, queen Anne, and prince George.

Over these royal personages are their effigies (except that of prince George) in wainscot presses; they are of wax-work resembling life, and dressed in their coronation robes.

Another wainscot press is placed at the corner of the great east window, in which is the effigy of the lady Mary, dutchess of Richmond, daughter to James duke

of Richmond and Lenox, dressed in the very robes her grace wore at the coronation of queen Anne.

On leaving this isle, you will be shewn, in another waincot press, the effigies of general Monk, who had a great share in the restoration of king Charles II. to the throne of England, and was interred in a vault appropriated to him and his family.

ST. NICHOLAS'S CHAPEL.

This chapel contains several remarkable monuments. Near the entrance is one of black marble, finely polished, to the memory of the lady Jane Clifford, youngest daughter to the duke of Somerset, and wife to Charles lord Clifford and Dungarvan, who died on the twenty-third of November 1679. This black monument is adorned with cherubims and a scroll of alabaster, whereon is written a long inscription in English, containing an account of the lady's descent and marriage.

By the door, on the same side, is a monument of alabaster, erected for lady Cecil, the daughter of lord Cobham; who having married Sir Robert Cecil, son to William lord Burleigh, treasurer of England, died in child-bed in 1591. The Latin inscription is a dialogue between herself and husband, expressing their mutual affection.

At some distance is a magnificent temple of various coloured marble, erected to the memory of Anne dutchess of Somerset, wife to Edward duke of Somerset. She died on the sixteenth of April 1618, aged twenty-eight. The inscription is in Latin and English, and contains a pompous detail of the noble lineage of this great lady, her alliances and issue.

In this chapel is likewise a very expensive monument, erected by the great lord Burleigh to the memory of his wife Mildred, and their daughter, the lady Anne, countess of Oxford, representing a stately temple built with porphyry, and other kinds of marble gilt. It is divided into two compartments, one elevated over the other. In the lower lies lady Burleigh, in a recumbent posture, with her daughter lady Jane in her arms; and at her head and feet are her children and grand-children kneeling. In the upper compartment is the figure of a venerable old man, supposed to be the lord Burleigh, on his knees, as if at fervent prayer. The lady Burleigh died on the fourth of April, 1589, aged sixty-three, after being forty years married, and her daughter, the lady Oxford, on the fifth of June, 1588. On the tomb is a long Latin inscription, explaining the figures, and displaying their respective virtues and accomplishments.

The next monument I shall mention in this chapel, is that of the lady Winifrid, married first to Sir Richard Sackville, Knt. and afterwards to John Paulet, marquis of Winchester. On the base are the figures of a knight armed, and kneeling; and facing him, a lady in mourning, also on her knees; behind whose back lies an infant on a baptismal font, with its head supported by a pillow.

In the middle of the chapel is a fine raised monument of polished marble, to the memory of Sir George Villars and his lady, whose son was raised by king James I. to the dignity of duke of Buckingham.

In this chapel are two beautiful pyramids; the largest erected to the memory of Nicholas Bagnal, a child of two months old, overlaid by his nurse; the other to the memory of Anna Sophia Harley, a child of a year old, daughter to the Hon. Christopher Harley, ambassador to the French king. She died in the year 1600; and her father, as appears by the inscription, caused her heart to be inclosed in a cup, and placed upon the top of the pyramid.

There are also in this chapel a monument to the memory of the lady Elizabeth Fanes, and one or two others scarcely worth notice.

THE CHAPEL OF ST. EDMUND.

At the entrance of this chapel is a lofty monument, with Gothic spires, erected to the memory of John of Eltham, second son to king Edward III. and so called from Eltham in Kent. His statue, in armour, is of white alabaster, the head incircled by a coronet. He died in Scotland at nineteen years of age, unmarried,

though three different matches had been proposed to him, the last of which, to Mary, daughter of Ferdinand king of Spain, he accepted, but lived not to consummate it.

At the feet of this is lately erected a handsome monument of white marble, with the following inscription:

“ In this chapel lies interred all that was mortal of the most illustrious and most benevolent John Paul Howard, earl of Stafford, who in 1738 married Elizabeth, daughter of A. Ewens, of the county of Somerset, Esq; by Elizabeth his wife, eldest daughter of John Saint Albin of Alfoxton, in the same county, Esq;

His heart was as truly great and noble

As his high descent:

Faithful to his God,

A lover of his country,

A relation to relations,

A detester of detraction,

A friend to mankind:

Naturally generous and compassionate;

His liberality and his charity to the poor

were without bounds.

We therefore piously hope, that at the last day,

His body will be received in glory

Into the everlasting tabernacles.

Being snatch'd away suddenly by death,

Which he had long meditated and expected

with constancy,

He went to a better life the first of April, 1762,

Having lived sixty-one years, nine months, and

six days.

The countess dowager, in testimony of her great

Affection and respect to her lord's memory,

Has caused this monument to be placed here.

The figures round the inscription are the ancient badges of honour belonging to the Stafford family, who descend, by ten different marriages, from the royal blood of England and France.

Invented and stained by Robert Chambers.

Next to this is a small table monument, on which lie the effigies of William of Windsor, and Blanch of the Tower, the son and daughter of Edward III. They took their surnames from the places of their birth, and both died in their infancy. They are dressed in the habits of the times, the young prince in a short doublet, of the indecency of which Chaucer's parson complains, and the princess in a horned head-dress, which Stow says was frightful.

On another tomb lies the statue of the lady Frances, dutchess of Suffolk, represented dressed in her robes. She was the daughter of the famous Charles Brandon, by Mary the French queen, daughter to Henry VII. and became dutchess of Suffolk by marrying Henry Grey, marquis of Dorset, who, upon her father's decease, was created duke of Suffolk. On her tomb are two inscriptions, the first in Latin verse, in praise of her virtues; and the other in English, shewing her different marriages.

The next is an elegant monument of white marble, erected by John earl of Clare, to the memory of his son Francis Hollis, a youth of great bravery, who, after returning from making a campaign in Flanders, died on the twelfth of August 1622, aged eighteen. He is represented clad in Grecian armour, sitting on a Greek altar. A good author, mentioning this statue, says, that it expresses more juvenile sweetness and beauty than any thing of the kind he ever saw, and that if this figure has any fault in character or design, it is being placed in a languid sedentary posture, though clothed in armour, and described as a hero in his bloom; a more spirited attitude, he observes, would have been more suitable to the person represented, would have given the statuary greater latitude to exert his genius, and afforded more satisfaction to the spectator. The epitaph on this is as follows:

What so thou hast of nature or of arts,

Youth, beauty, strength, or what excelling parts

Of mind and body, letters, arms, and worth,

His eighteen years, beyond his years brought forth:

Then

Then stand, and read thyself within this glass,
How soon these perish, and thy self may pass;
Man's life is measur'd by the work, not days,
No aged sloth, but active youth hath praise.

On an altar, in the same taste, but differently ornamented, sits the statue of the lady Elizabeth Ruffel, the daughter of lord Ruffel. This statue is of white alabaster, and the lady is represented in a sleeping posture. Your guides say, that she died with a prick of her finger; but this story has no other foundation, than a misapprehension of the statuary's design; for having represented her asleep, and pointing with her finger to a death's head under her right foot, it has been supposed, by the position of her finger pointing downwards, that it was bleeding, and that this had closed her eyes in death; though the artist's design seems rather to allude to the composed situation of her mind at the approach of death, which she considered only as a profound sleep, from which she was again to wake to a joyful resurrection, of which the motto under her feet is an evident illustration, *Dormit, non mortua est*; "She is not dead, but sleepeth." The Latin inscription on the scroll beneath, only tells, that this monument was erected to her memory by her afflicted sister, Anne. The device is an eagle, the emblem of eternity, resting on a florilege of roses, &c.

Within the iron rails that inclose this last monument, is a magnificent one to the memory of John lord Ruffel, son and heir to Francis earl of Bedford, and of his young son Francis, by Elizabeth, the daughter of Sir Anthony Cook, knight. This monument is of various coloured marble: and alabaster, and is adorned with gilding. Lord Ruffel is represented lying in his robes, with his infant son at his feet. His lady, who erected this tomb, was esteemed the Sappho of the age, and was not only an excellent poetess, but mistress of the learned languages; and five epitaphs on this tomb are of her composition, three of which are in Latin, one in Greek, and the other in English, which last is here transcribed as a specimen of the rest, that are to the same purpose:

Right noble twice, by virtue, and by birth,
Of Heaven lov'd, and honour'd on the earth:
His country's hope, his kindred's chief delight,
My husband dear, more the world's fair light,
Death hath me 'rest. But I from death will take
His memory, to whom this tomb I make.
John was his name (ah, was!) wretch, must I say;
Lord Ruffel once, now my tear-thirsty clay.

In this chapel is a monument partly inclosed, to the memory of Talbot earl of Shrewsbury, and his lady, who are represented lying on a black marble table, supported by an alabaster pedestal. This monument is adorned with variegated marble, finely carved. The inscription contains his titles and character, which is a very noble one, and informs us, that he died on the eighth of February 1617, in the fifty-seventh year of his age.

In this chapel are several other monuments, adorned, in their ancient manner, with statues lying flat on the backs; and also some other monuments affixed to the walls.

THE CHAPEL OF ST. BENEDICT.

This chapel is next to the south cross, and has a monument erected to the memory of Lionel Cranfield, earl of Middlesex, lord high treasurer of England in the reign of king James I. This monument was erected by his relict, the lady Anne, and is of black marble, on which are two statues in a recumbent posture, representing his lordship lying in his robes, with his lady. It has a long Latin inscription, representing his various employments and honours, and that he finished his life in a retired leisure, and died on the sixth of August 1645, aged seventy.

On the east side, where stood the altar of St. Benedict, is a monument of various kinds of marble, in memory of lady Frances, countess of Hertford, who died on the fourteenth of May 1598, in the forty-fourth year of her age. It is of various kinds of marble, and the countess is in the old taste represented in her robes, lying with

her head resting on an embroidered cushion, and her feet on the back of a lion.

On the south side of this chapel is a table monument of white marble, to the memory of George Sprat, the second son of Dr. Sprat, bishop of Rochester, an infant of a year old.

Near it is the monument of Dr. Gabriel Goodman, the first dean of this church, who founded an hospital, and instituted a school at Rathven in Denbighshire, where he was born. He was a person of great piety, and was the first who raised the learned Camden from obscurity. He is represented kneeling, in his proper habit. He died in 1601.

Thus have we surveyed the principal monuments within this spacious building, and shall conclude with a short view of the cloisters of this abbey.

In the south walk of the cloisters, towards the east end, are the remains of four abbots marked in the pavement by four stones,

The first is of black marble, called Long Meg, from its extraordinary length of eleven feet eight inches, and covers the ashes of Gervasius de Blois, natural son to king Stephen, who died in 1166.

The second is a raised stone of Suffex marble, under which lies interred the abbot Laurentius, who died in 1176, and is said to have been the first who obtained from pope Alexander III. the privilege of using the mitre, ring, and globe.

The third is a stone of grey marble, to the memory of Geslebertus Crispinus, who died in 1114. His effigy may still be traced on his grave-stone, by the fragments of his mitre and pastoral staff.

The fourth is the eldest of all, and was formerly covered with plates of brass, inscribed to the abbot Vitales, who died in 1082. All these seem to have had their names and dates cut afresh, and are indeed fragments worthy to be preserved.

In this walk are many other notable interments, but having nothing particular now to distinguish them, we shall not trouble our readers with their names.

Against the wall, in the centre of the east walk, is a monument lately erected to the memory of George Walsh, Esq; with the following inscription:

"Near this place are deposited the remains of George Walsh, Esq; late lieutenant-general of his majesty's forces, and colonel of the forty-ninth regiment of foot, who died on the twenty-third of October 1761, aged seventy-three."

The toils of life and pangs of death are o'er,
And care, and pain, and sickness, are no more.

We shall take notice but of one inscription more, and close our account. This is upon a handsome monument in the East Walk, almost facing the ancient abbots already mentioned; and for the purity of the diction, the propriety and elegance of the composition, exceeds every other in the church or cloisters.

Reader,

If thou art a BRITON,
Behold this tomb with reverence and regret;
Here lieth the remains of

DANIEL PULTENEY,

The kindest relation, the truest friend,
The warmest patriot, the worthiest man;

He exercised virtues in this age,
Sufficient to have distinguish'd him even in the best.

Sagacious by nature,

Industrious by habit,

Inquisitive with art;

He gain'd a complete knowledge of the state of Britain;
Foreign and domestic.

In most the backward fruit of tedious experience,
In him the early acquisition of undissipated youth.

He served the court several years:

Abroad, in the auspicious reign of queen Anne,
At home, in the reign of that excellent prince king George I.

He served his country always,

At court independent,

In the senate unbiass'd

At every age and in every station:

This

This was the bent of his generous soul,
This the business of his laborious life.

Public men, and public things,
He judged by one constant standard,
"The true interest of Britain;"

He made no other distinction of party,
He abhorred all other;

Gentle, humane, disinterested, beneficent;
He created no enemies on his own account :

Firm, determin'd, inflexible,
He feared none he could create in the cause of Britain.

Reader,

In this misfortune of thy country, lament thy own.

For know,

The loss of so much private virtue
Is a public calamity.

Near the north door of the abbey is St. Margaret's church, originally erected by Edward the Confessor, but has been several times since rebuilt and repaired. In the year 1735, it was not only repaired, but its tower was raised, at the expence of three thousand five hundred pounds, granted by parliament in consideration of its being the church where the House of Commons attend divine service on stated holidays, as the peers do at Westminster Abbey.

It is a plain, neat, and not inelegant Gothic structure, well enlightened by a series of large windows. It has two handsome galleries of considerable length, adorned in the front with carved work: these are supported by slender pillars, which rise to the roof, and have four small black pillars running along each of them, adorned with gilded capitals both at the galleries and at the top, where the flat roof is neatly ornamented with stucco.

This church, in 1758, was again repaired at the public expence, and ornamented with new gilding and painting.

In the east end of this church is a window curiously painted, with the history of the crucifixion, together with the figures of several apostles and saints, finely executed. It belonged formerly to a private chapel at Copt-hall, near Epping, in Essex, and was purchased by the officers of this parish a few years ago, for four hundred guineas.

The church of St. John the Evangelist was built in 1728, and is remarkable only for having sunk while it was building, which occasioned an alteration in the plan. On the north and south sides of this church are magnificent porticoes, supported by vast stone pillars, as is also the roof of the church. At each of the four corners is a beautiful stone tower and pinnacle: these additions were erected, that the whole might sink equally, and owe their magnitude to the same cause. The parts of this building are held together by iron bars, which cross even the isles.

Near the abbey church is the king's school, usually called Westminster school. It was originally founded in 1070, and founded a second time by queen Elizabeth in 1560, whence it is sometimes called the Queen's college, for a head master, a second master, and forty scholars, who are called King's scholars, and fitted for the university: they are provided with all necessaries except cloathing, of which they have only a gown once a year. This is now become one of the greatest schools in the kingdom: it has not only a first and second master, but five ushers; and besides the boys upon the foundation, here are between three and four hundred young gentlemen, most of them the children of persons of the first fortunes and families in the kingdom. Out of this school six or more boys are elected yearly for Trinity College, in Cambridge, and Christ's Church, in Oxford.

Near the west gate of the abbey church is a building called the Gate-house, which is used as a prison, both for debtors and felons, and was erected in the time of king Edward III.

In a place called Tothill-fields, in the parish of St. Margaret, there is a bridewell or work-house; and in the same parish, an hospital, founded by king Charles I.

for poor orphans, besides ten alms-houses, and six charity-schools.

On the north-east side of the abbey church, is an old Gothic building, called Westminster-hall, first built by William Rufus, as an addition to a royal palace there, and afterwards rebuilt by king Richard II. in the year 1397. It is reckoned one of the largest rooms in Europe, being two hundred and seventy feet long, seventy-four feet broad, and ninety feet high, supported only by buttresses, without one pillar: the roof is timber, and was a few years ago slated, the old covering of lead being thought too heavy: the pavement is of stone. In this spacious room the kings of England have generally held their coronation, and other solemn feasts. It is generally used for the trial of peers; and here, ever since the reign of Henry III. the three great courts of Chancery, King's Bench, and Common Pleas, have been generally held at the four terms of the year; and the court of Exchequer is held above stairs.

Adjoining to the south-east angle of Westminster-hall, is a building formerly called St. Stephen's chapel, from its having been dedicated to St. Stephen. It was founded by king Stephen, and in 1347, rebuilt by king Edward III. who converted it to a collegiate church; but ever since it was surrendered to Edward VI. it has been used for the assembly of the representatives of the Commons of England, and is now generally called the House of Commons. It is a neat room, capable of holding six hundred persons, and has commodious apartments about it, as the speaker's chamber, rooms for committees, and other offices. The benches for the members, which gradually ascend one above another, as in a theatre, are covered with green cloth; the floor is matted, and there are wainscot galleries around it, sustained by cantilevers adorned with carved work, where strangers are often permitted to sit and hear the debates.

Adjoining to Westminster-hall, on the south side, is an edifice called the House of Lords, or the House of Peers, from being the place where the peers of Great Britain assemble in parliament. This house stands south and north, as that of the Commons does east and west. It is an oblong room, somewhat less than that in which the Commons meet, and is hung with fine old tapestry, with historical figures, representing the defeat of the Spanish Armada in 1588, the gift of the states of Holland to queen Elizabeth. Here is a throne for the king, with seats on the right and left for such princes of the blood as are peers of the realm. Before the throne are three broad seats, stuffed with wool; on the first of which, next to the throne, sits the lord chancellor, or keeper of the great seal, who is speaker of the House of Peers; and on the other two sit the judges, the master of the Rolls, or the masters in Chancery, who attend occasionally to be consulted in points of law. The two archbishops sit at some distance from the throne, on the right hand, and the other bishops in a row under them. The benches for the lords spiritual and temporal are covered with red cloth; and there is a bar across the house, at the end opposite to the throne.

Adjoining to the House of Lords is an apartment called the Prince's Chamber, where the king is robed when he comes to the house; and there are other apartments in which the peers put on their robes.

Between the House of Lords and the House of Commons is an apartment called the Court of Requests, where such as have business in either house attend.

Another apartment, called the Painted Chamber, stands also between both houses: this is said to have been Edward the Confessor's bed-chamber, and the room in which the parliaments were anciently opened. Conferences are often held here between the two houses, or their committees, there being a gallery of communication for the members of the House of Commons to come up without being crowded.

But the principal public building in Westminster, is a bridge, called Westminster-bridge, built over the Thames, from a place called the Woolstaple, near New Palace-yard, to the opposite shore. The horse-ferry at Westminster was perhaps one of the most frequented passages over the river of Thames, ever since the build-

ing of London bridge, and laying aside the ancient ferry there. From the multitude of coaches, carriages and horses, continually passing and repassing at all hours, times and seasons, many inconveniences and accidents unavoidably happened, and in a course of time many lives were lost. To prevent these inconveniences and dangers, the archbishop of Canterbury, and several other noblemen, in the year 1736, procured an act of parliament for building a bridge across the Thames, from New Palace-yard, to the opposite shore in the county of Surry: but this act was not obtained without great opposition from the people of London and Southwark, and some fainter efforts used by the bargemen and watermen of the Thames; but private interest was obliged to give way to the public advantage, and preparations were made for carrying on this great work under the sanction of the legislature.

At length, the ballast-men of Trinity-house were employed to open a large hole for the foundation of the first pier, to the depth of five feet under the bed of the river; and this being finished and levelled at the bottom, it was kept to a level by a proper inclosure of strong piles. Mean while, a strong case of oak, secured and strengthened with large beams, was prepared, of the form and dimensions of the intended pier in the clear: this was made water-proof, and being brought over the place, was secured within the piles.

In this wooden case the first stone was laid on the twenty-ninth of January 1738-9, by the late earl of Pembroke: the case of boards was above the high-water mark, and it sinking gradually by the weight of the prodigious blocks of stone strongly cemented to its bottom, the men continued to work as on dry ground, though at a great depth under water. Thus the western middle pier was first formed, and in the same manner were all the other piers erected, and when finished, the planks on the sides being taken off, the stone-work appeared entire. The superstructure was added in the common method, and the whole finished in the most neat and elegant manner, and with such simplicity and grandeur, that whether viewed from the water, or more closely examined by the passenger who goes over it, it fills the mind with an agreeable surprize.

This bridge is universally allowed to be one of the finest in the world. It is adorned and secured on each side by a very lofty and noble balustrade, there are recesses over every pier, which is a semioctagon. Twelve of them are covered with half domes, viz. four at each end, and four in the middle. Between these in the middle are pedestals, on which was intended a group of figures; this would greatly add to the magnificence, by making the centre more principal, (which it ought to be) and giving it an air of magnificence and grandeur suitable to the city to which it belongs. A great number of lamps are so agreeably disposed on the top of the recesses, as at once to contribute to the purposes of use and beauty. This magnificent structure is one thousand two hundred and twenty-three feet in length, and above three hundred feet longer than London bridge. The ascent at the top is extremely well managed, and the room allowed for passengers, consists of a commodious foot-way, seven feet broad on each side, paved with broad moor-stone, and raised above the road allowed for carriages. This last is thirty feet wide, and is sufficient to admit the passage of three carriages and two horses on a breast, without the least danger.

The construction and distance of the piers from each other are so managed, that the vacancies under the arches allowed for the water-way, are four times as much as at London-bridge; and in consequence of this, there is no fall, nor can the least danger arrive to boats in passing through the arches. The piers, which are fourteen, have thirteen large and two small arches, all semicircular. These, with two abutments, constitute the bridge, whose strength is not inferior to its elegance.

The length of every pier is seventy-feet, and each end is terminated with a saliant angle against either stream. The breadth of the two middle piers is seventeen feet at the springing of the arches, and contain three thousand cubic feet, or near two hundred tons of solid

stone; and the others on each side, regularly decrease one foot in breadth, so that the two next to the largest are each sixteen feet, and so on to the two least next the sides, which are no more than twelve feet wide at the springing of the arches.

The centre arch is seventy-six feet wide, and the others decrease in width four feet on each side, so that the two next to the centre arch are seventy-two feet wide, and so on to the least of the large arches, which are each fifty-two feet wide, and the two small ones in the abutments close to the shore, are about twenty feet in width.

The foundation of the bridge is laid on a solid and firm mass of gravel which lies at the bottom of the bed of the river; but at a much greater depth on the Surry than the Westminster side; and this inequality of the ground, required the heights of the several piers to be very different, as some have their foundations laid at five feet, and others at fourteen feet under the bed of the river. The piers are all four feet wider at their foundation than at the top, and are founded on the bottoms of the above-mentioned wooden cases formed of the most substantial work, eighty feet in length, twenty-eight in breadth, and these timbers are two feet in thickness. The caisson or wooden case, in which the first pier was built, contained an hundred and fifty loads of timber; and forty thousand pound weight is computed to be always under water in stone and timber.

The materials are much superior to those commonly used on such occasions: the inside is usually filled up with chalk, small stones, or rubbish; but here all the piers are the same on the inside as without, of solid blocks of Portland stone, many of which are four or five tons weight, and none less than a ton, except the closers, or smaller ones, intended for fastening the others, one of which has its place between every four of the large ones. These vast blocks are perfectly well wrought for uniting; they are laid in Dutch terrace, and also fastened together with iron cramps run in with lead. All this iron-work is, however, entirely concealed, and so placed, that none of them can be affected by the water.

It is also worthy of remark, that the soffit of every arch is turned and built quite through with blocks of Portland stone, over which is built and bonded in with it, another arch of Purbeck stone, four or five times thicker on the reins than over the key; and by this secondary arch, together with the incumbent load of materials, all the parts of every arch are in equilibrio, and the whole weight so happily adjusted, that each arch can stand single, without affecting, or being affected by the other arches. In short, between every two arches a drain is contrived to carry off the water and filth that might in time penetrate and accumulate in those places, to the great detriment of the arches.

Though the greatest care was taken in laying the foundation deep in the gravel, and using every probable method to prevent the sinking of the piers, yet all this was in some degree ineffectual; for one of them sunk so considerably when the work was very near completed, as to retard the finishing it a considerable time. This gave the highest satisfaction to those who had opposed this noble work: but the commissioners for building the bridge immediately ordered the arch supported by that pier, on the side where it had sunk, to be taken down, and then caused the base of the pier to be loaded with incredible weights, till all the settlement that could be forced was made. After this the arch was rebuilt, and has ever since been as secure as the rest.

In short, the last stone was laid in November 1747, eleven years and nine months from the beginning of the construction; a very short period, considering the vastness of the undertaking, the prodigious quantity of stone made use of, hewn out of the quarry, and brought by sea; the interruptions of winter, the damage frequently done by the ice to the piles and scaffolding, and the unavoidable interruptions occasioned twice a day by the tide, which, for two years together, reduced the time of labour to only five hours a day. The expence of erecting this bridge, and of procuring all the requisite conveniences,

conveniencies, was defrayed by parliament, and amounted to three hundred and eighty-nine thousand, five hundred pounds, which was raised by several lotteries.

This bridge, considered in itself, is not only a great ornament to this metropolis, and of the most singular advantage to the city of Westminster; but it has entirely changed the appearance of that city; new and beautiful streets have been erected; those that were before narrow, crooked and ill-built, have been widened, rendered straight, and rebuilt with regularity and elegance. And new plans of improvement are daily formed, and continually putting in execution.

On the bank of the Thames, at the confines of St. Margaret's parish, and next to those of St. Martin's in the Fields, was a palace called Whitehall, originally built by Hubert de Burgh, earl of Kent, before the year 1243. It afterwards came to the archbishops of York; whence it was called York Place, and continued to be the city residence of the archbishops, till it was purchased by king Henry VIII. of cardinal Wolsey, in 1530; then it became the place of residence for the court, and continued so till the year 1697, when, by accidental fire, it was all burnt down, except the part called the Banqueting-house, which had been added to the palace of Whitehall by king James I. according to a design of Inigo Jones. This Banqueting-house is an elegant and magnificent structure, built of hewn stone, adorned with an upper and lower range of pillars, of the Ionic and Composite order: the capitals are enriched with fruit and foliage; and between the columns are the windows. The roof is covered with lead, and surrounded with a balustrade. The Banqueting-house chiefly consists of one room, of an oblong form, forty feet high, and a proportionable length and breadth. The ceiling is painted by the celebrated Sir Peter Paul Rubens. It is now used only as a chapel-royal, and the rest of the house serves for state offices.

Opposite to the Banqueting-house is a modern edifice, in a very good manner, called the Horse-guards, from the king's horse-guards, who, while his majesty resides at St. James's palace, do duty here, two at a time being constantly mounted, and completely armed, under two slope porches detached from the building, and erected to shelter them from the weather. This structure consists of a centre and two wings. In the centre is an arched passage into St. James's Park; and the building over this has a pediment, on which are the king's arms cut in bas relief. The wing on each side of this centre is a pavilion, and in the middle rises a cupola: the wings are plainer than the centre, and consist each of a front, projecting a little, with ornamented windows in the principal story, and a plain one in the sides: each has its pediment, with a circular window in the centre.

Near the Horse-guards is the Treasury, under the government of five lords commissioners, one of whom is called first lord of the treasury: under these are two joint secretaries, four chief clerks, and sixteen under clerks, with other officers. This building fronts the Parade in St. James's Park, and consists of three stories. It has a court on the inside, surrounded with buildings. The office of trade and plantations is also kept here, under the government of eight commissioners, and other officers, whose business it is to examine the custom-house accounts of all the goods exported and imported to and from the several parts of the kingdom; in order to discover the advantages and disadvantages of the trade of this nation with other kingdoms and states, in regard to the balance of trade; and also to benefit our plantations, by promoting their trade, and encouraging such branches as are most conducive to their respective interests, as well as that of the kingdom in general.

The church of St. Martin was so called from having been dedicated to St. Martin. It is also distinguished by the name of St. Martin's in the Fields, from its situation, which was formerly a field, with only a few houses about it; though now it is nearly in the centre of that vast mass of buildings which has connected Westminster with London, and runs out collaterally to a very great extent. The church of St. Martin being decayed, was

rebuilt by Henry VIII. It was afterwards rebuilt by king James I. but not being large enough to accommodate the inhabitants, it was augmented in 1607, at the charge of prince Henry, eldest son of James I. and several of the nobility; but after many expensive reparations, it was entirely taken down in 1720, according to an act of parliament, and a new church begun, which was finished in 1726. This is an elegant edifice, built of stone. It has a noble portico on the west front, of Corinthian columns, supporting a pediment, in which are the royal arms cut in bas relief. The ascent to this portico is by a flight of very long steps. The length of this church is about one hundred and forty feet, the breadth sixty, and the height forty-five: it has a fine arched roof, sustained by Corinthian stone columns. The steeple has a beautiful spire, and one of the best rings of bells in London. The parish of St. Martin, which is supposed to have been originally taken out of St. Margaret's, has so increased both in houses and inhabitants, that it is now one of the largest and most populous in the bills of mortality; and though the parishes of St. Paul's, Covent-Garden, St. Anne's, St. James's, and St. George's, Hanover-square, have been taken out of it, the number of its houses is computed at no less than four thousand.

The Admiralty-office is in this parish, and is a magnificent structure, built with brick and stone. The east front has two deep wings, and a very lofty portico, supported by four very large stone pillars. Besides a hall, and other common rooms, here are seven spacious houses for seven commissioners of the Admiralty. The wall before the court has been lately rebuilt in an elegant manner: a piazza, consisting of beautiful columns, runs almost from one end to the other, and each side of the gate is ornamented with a sea-horse, not ill cut in stone. In this office are transacted all affairs belonging to the jurisdiction of the Admiralty; admirals, captains, and other naval officers, are nominated, and orders issued for the trial of those who have failed in their duty.

In the parish of St. Martin, where several capital streets terminate, is a large opening called Charing-cross, from one of the crosses which king Edward I. caused to be erected in memory of his queen Eleanor, and Charing, the name of a village which stood on the spot where the cross was built. The cross continued till the civil wars in the reign of Charles I. when it was entirely destroyed by the fanatics, as a monument of popish superstition; but after the restoration, an equestrian statue of king Charles I. was set up in its stead. This statue still remains; it is of brass, and very finely executed. It stands on a pedestal seventeen feet high, and is secured by a palisade, inclosing an area of thirty feet diameter, which is elevated about twelve inches above the street.

Near Charing-cross, upon the east side, is Northumberland-house, so called from its having been in possession of the earls of Northumberland for more than a hundred years. It was originally built in the reign of king James I. by Henry Howard, earl of Northampton, and is almost the only house of the ancient nobility remaining in London. It originally consisted of three sides only, but is now a spacious quadrangle, with a large garden and fine walks behind it, extending almost to the Thames.

From the size of Northumberland-house, one would imagine there were more rooms of magnificence and shew than are found in it, at least, if all worth seeing are shewn. We saw only one suite of rooms; entering a common dining parlour about twenty feet by twenty; out of that into a dining-room, forty-five by twenty, handsomely furnished; the chimney-piece elegant, Siena and white marble in compartments, with a central piece of basso relievo polished; and all supported by two very handsome fluted pillars of Siena marble. In this room is found that noble picture, the Cornaro family, by Titian, which highly deserves the admiration of every lover of painting. Those who have not viewed the capital well-preserved pieces of this master in the foreign collections, but have drawn their ideas of him from his works in England, will be surprised to find the colouring

of this picture what may yet be called fresh. The heads and hands are of the most perfect expression; not the imitation of life, but life itself; nothing can be in a finer taste than these three exquisite portraits. The connoisseurs may discover beauties of a peculiar nature in this piece; but the unlearned spectator, who views with no prejudices but those in favour of nature, will be struck greatly at the sight of such venerable heads, that carry in their air, and every trait, the marks of such genuine expression.

Next comes a drawing-room, forty by twenty: this is also well furnished; the chimney-piece light and elegant; the mosaic'd ceiling in the fresco stile, pretty. At one end is a large landscape by Salvator Rosa, which is fine; rocks and trees jumbled together in the wildness of that romantic genius, which seemed formed by nature to catch her sublimest hints; with a little group of figures dropped from a whirlwind. Opposite, Ixion by Lancetti, an horrible subject, and handled in a dark, but not an inexpressive manner. Besides these pieces, is a small landscape of a stream, with a bridge over it cut out of the rock; it is a pleasing, natural, glowing piece. The two larger pictures, companions, one on each side the chimney, of female figures, want that *agrément*, that soft, voluptuous elegance of the naked, which ought ever to be found in pieces of this sort: that on the right side of the chimney is by much the most pleasing, the attitude of the woman is easy, and expressively painted. Over the landscape by Salvator, is a very pleasing picture of Venus lying along on a coach, which in softness, colouring, and an enticing expression of the *enbonpoint*, is well worth attention; it reminds one of the famous Venus by Titian; like his, her face is by no means answerable to her body; the posture is in every respect the same, except the position of the left hand, which Titian has thrown *negligement sur ce*, says M. Cochin, *que la modestie doit cacher*, but here it falls on the thigh. Which is the most modest of these Venus's?

From this drawing-room, we enter a small breakfast-room of about twenty by twenty, hung with tapestry; and out of that into the great ball-room, one of the most elegant in London: it is one hundred and three feet long, twenty-seven broad, and thirty-two high, richly ornamented with gilding, &c. The ceiling (which is coved) is very beautifully adorned with medallions, copies of antiques, particularly a Fame, a Flora, a Victory, and a Diana. On one side the room are two chimney-pieces, the cornices of which are basso relievos of white marble, and supported by figures of Phrygian captives, copies from others in the capitol; but they are rather too bulky for this use. The other side of the room contains a double range of windows, which are contrived in a very peculiar manner; for notwithstanding the size of the room, the lower ones are of common dimensions and height, which is a circumstance extremely agreeable: the upper range is quite concealed behind the cornice, insomuch that you must be close to the opposite side of the room to discover the immediate track of their light: by means of this contrivance, the room is equally lighted from the floor to the ceiling, and the pictures are viewed without the least glare. In the piers between the windows of the lower range are very elegant glasses, and several slabs of agate, and the finest and rarest marbles. The sofas and chairs are of crimson damask, (window-curtains of the same) with gilt arms and legs. There are four glass lustres.

But the principal ornaments of this beautiful room are the paintings; in respect of which we cannot but greatly admire the taste of the noble owner, who, rather than furnish it with such originals as are to be procured at present, ordered copies of some capital ones of the greatest painters, by the first artists of this age. The success his grace met with in the execution, was equal to the propriety of the idea; for here are five paintings which may really be called admirable. It by no means becomes me to talk of a distinction between copies and originals. In the centre is the School of Athens, after Raphael, by Raphael Mengs, which, in defiance of this immortal name, we shall venture to pronounce a learned,

but by no means a pleasing picture. The grouping, in respect of picturesque composition, is excellent, but the piece is very rightly called a School, for it consists of many groups with scarce any unity. The figures are in most respects fine, but are little better, from the distinctness of their employments from each other, than so many portraits: the draperies are in general in a heavy, inelegant stile; but the airs of the heads, and the variety of the composition, are excellent.

On one side of this is the council, and on the other the feast of the Gods, both by Raphael, and copied by Pompeo Battoni. In the first, the bold strength of what may be called muscular expression, is admirable; for the artist seems in this piece to have consulted little besides displaying his anatomical learning; the drawing, it is true, is fine; but the drawing of a satyr may be as fine as that of a Venus! There is throughout this picture a great want of grace; every limb is thick, unwieldy, and heavy.

The feast of the Gods is infinitely finer; for here are a great number of figures admirably grouped, and some of them extremely graceful; with a general variety in the composition, which must be striking to every one. The woman in the centre, whose back parts are alone seen, is admirably drawn, and the turn and inflection of the limbs expressed in the happiest manner; also the three secondary female figures in the corner of the right side, are graceful, and very pleasing; the airs of the heads, in general, and the stile of the whole composition, is fine; but in neither this, nor the preceding, are many marks of that brilliancy, and pleasing diffusion of lights and shades which result from the refined practice of the *chiaro oscuro*.

At the upper end of the room is the Triumph of Bacchus, after Annibal Carrach, by Costanzi; a picture which, however correct the drawing may be, is by no means pleasing: the subject could be chose by none but an artist who wanted to display the distortions of the human body. Thus we see in the corner, on the right side, a woman a very Bright in flesh, with drapery so well drawn, as to display the shape of the limbs correctly through it; who can view them, and not wish for those of a beauty, instead of an oyster-wench? Another, somewhat better made, holds up her hands and arms in all the fury of intoxication. Surely this painter must have a strange taste, thus to represent the human form! But a greater fault is the unmeaning, silly insipidity of Bacchus, who surely ought to have had marks of a peculiar and animated spirit upon such an occasion; instead of which, he sits in his car with as much calmness, as quiet, sober, and mild a countenance, as if he had been in a council of the Gods, instead of a drunken frolic. These circumstances more than balance the excellencies of drawing, colouring, &c. which are found in this piece.

But the Aurora, after Guido, by Masuccio, makes ample amends for all the rest. Sure never was grace, in all the divinity of its most pleasing attitudes, more elegantly caught than in this happy, this sweet idea, which is executed with as much spirit as it was conceived with elegance. The whole range of painting cannot exhibit a more pleasing group; each figure is shewn to the best advantage; and each most peculiarly elegant: but the principal of the graces is GRACE itself; the arms are extended in so beautiful a manner, the whole body is turned with such amazing elegance, that a superior is scarcely to be imagined. The colouring, the general diffusion of the clear obscure, the wonderful elegance of the whole, is unparalleled: but Apollo (the principal figure) is by no means equal to any of the graces; his attitude is not unpleasing; but it is tame, inexpressive, and infinitely inferior in grace to the figure above-mentioned.

Near Charing-cross, on the north side, is a place called the Mews, now containing stables for the king's horses. Mews is a name given to places where hawks are kept, and is derived from Mew, a term used among falconers, signifying to moult, or cast feathers; and this place was used for the accommodation of the king's falconers and hawks, so early as the year 1377; but the king's

king's stables at Lomesbury, now called Bloomsbury, being destroyed by fire in the year 1537, king Henry VIII. caused the hawks to be removed, and the Mews to be enlarged, and fitted up for his horses, and it has continued to be the king's stables ever since. The building consists of a quadrangle; which being greatly decayed, the north side was rebuilt in a magnificent manner by king George II. in the year 1732.

Near the Mews are a public school and library, belonging to St. Martin's parish. This school was endowed, and the library well furnished with books, in the reign of king James II. by Dr. Tennison, then minister in this parish, and afterwards archbishop of Canterbury.

In the parish of St. Martin is an old building, called St. James's House, to which the court removed upon the burning of Whitehall in 1697; and it has continued to be the residence of our kings ever since. An hospital, founded by the citizens of London before the conquest, for fourteen leprous maids, formerly stood on this spot; and from this hospital the palace, which was built by king Henry VIII. soon after the general dissolution, derived its name. It is an irregular building, of a mean appearance from without, but it contains many beautiful and magnificent apartments. The chapel of the hospital was converted to the use of the royal family, as it remains to this day, and is a royal peculiar exempted from all episcopal jurisdiction. The service of the chapel is like that in cathedrals; and for that end there belongs to it a dean, a lord almoner, a sub-dean, forty-eight chaplains, who preach in their turns before the royal family, twelve gentlemen of the chapel, two organists, ten children, a serjeant, a yeoman, a groom of the vestry, and a bell-ringer.

When this palace was built, it abutted in the south-west upon an uncultivated swampy tract of ground, which the king inclosed, and converted into a park, called from the palace St. James's Park: he also laid it out into walks, and collected the water into one body. It was afterwards much enlarged and improved by Charles II. who planted it with lime-trees, and formed a beautiful vista, near half a mile in length, called the Mall, from its being adapted to a play at bowls so called. He also formed the water into a canal of one hundred feet broad, and two thousand eight hundred feet long; and furnished the park with a decoy, and other ponds for water-fowl. This park, which is near a mile and an half in circumference, and surrounded with magnificent structures, is constantly open, and used as a thoroughfare by all sorts of people. At the east end is a spacious parade for the exercise of the horse and foot guards.

In a line with St. James's Palace, on the east side, is Marlborough-house, which belongs to the duke of Marlborough, and is a very large brick edifice, ornamented with stone, and built in a peculiar taste. It has two wings, and a very spacious court before it. The front, which is very extensive, has only two series of windows. The building is terminated by a balustrade on the top; and the apartments are magnificent, well disposed, and richly furnished.

On the west side of St. James's Park, fronting the Mall and grand canal, stands the Queen's Palace. It was originally known by the name of Arlington-house; but being purchased by the late duke of Buckingham's father, who rebuilt it, in 1703, from the ground, with brick and stone, it was called Buckingham-house till the year 1762, when his present majesty bought it; and it began to be called the Queen's Palace, from the particular pleasure the queen expressed in the retirement of this house. It is in every respect a fine building, and not only commands a prospect of St. James's Park in front, but has a park, lately much enlarged, and a canal, belonging to itself behind it, together with a good garden, and a fine terrace, from whence, as well as from the apartments, there is a prospect of the adjacent country. It has a spacious court-yard, inclosed with iron rails, fronting St. James's Park, with offices on each side, separated from the mansion-house by two wings of bending piazzas, and arched galleries, elevated

on pillars of the Tuscan, Doric, and Ionic orders. Each front of this house has two ranges of pilasters, of the Corinthian and Tuscan orders.

A new library has been lately added to this palace, filled with the best authors in various languages. Here is also a fine collection of prints; and the whole structure is adorned with a great variety of pictures by the most eminent masters. Among them are the famous cartoons by Raphael, removed from Hampton Court.

These cartoons are seven pieces of sacred history taken from the New Testament, and were designed as patterns for tapestry. They are painted on paper, with great delicacy and beauty, in water-colours.

The story of the first is the miraculous draught of fishes, Luke v. In this Christ appears in the boat with an air of divine gentleness; the large fowl placed on the shore in the fore-ground, have a sea wildness in them, and prevent the heaviness which that part of the picture would otherwise have had, by breaking the parallel lines that would have been made by the boat, and the base of the picture. Raphael has, indeed, made a boat too little to hold the figures he has placed in it: but had he made it large enough for those figures, the picture would have been all boat; and to have made his figures small enough for a vessel of that size, would have rendered them unsuitable to the rest of the set, and less considerable.

The second is the Delivery of the Keys, John xxi. and has received an injury. As this is the appearance of our Saviour after the resurrection, present authority, late suffering, humility and majesty, command and love, are finely mixed in his divine aspect. He is wrapped only in one large piece of white drapery; his left arm and breast are bare, and part of his legs naked. The figures of the eleven apostles all express the same passion of admiration, but discover it differently according to their characters. Peter receives his master's orders on his knees, with an admiration mixed with a more particular attention; the beloved disciple has, in his countenance, wonder lost in love: the last personage, whose back only is seen, one would fancy to be Thomas, whose perplexed concern could not be better drawn than by this acknowledgment of the difficulty to describe it. The mixture of tints in the draperies all together produce a wonderful harmony.

The third is the Miracle of healing the Cripple at the beautiful gate of the Temple, Acts iii. All the figures are admirably performed.

The fourth is the death of Ananias, Acts v. Here is the greatest dignity in the apostles; they are, however, only a subordinate group, because the principal action relates to the criminal; thither the eye is directed by almost all the figures; what a horror and reverence is visible in the whole assembly on this mercenary man's falling down dead!

The fifth is Elymas the forcerer, struck with blindness, Acts xii. His whole body expresses his being blind. How admirably are terror and astonishment expressed in the people present, and how variously according to their several characters! What grace and majesty is seen in the great Apostle of the Gentiles, denouncing vengeance on the forcerers! The proconsul has a greatness and a grace superior to his character, equal to what one might suppose in a Cæsar.

The sixth is the sacrifice to Paul and Barnabas by the people of Lycaonia, Acts xiv. The occasion of this is finely told; the man healed of his lameness, to express his sense of the divine power which appeared in the apostles, and to shew it to be him, not only has a crutch under his feet on the ground, but an old man takes up the lappet of his garment, and looks upon the limb he remembers to have been crippled, expressing great devotion and amazement; which are sentiments seen in the other, with a mixture of joy. The group of the ox and popa are taken from a bas-relievo in the Villa de Medici.

The seventh is St. Paul preaching to the Athenians, Acts xvii. The divine orator is the chief figure; but with what wonderful art are almost all the different tempers of mankind represented in the audience! This picture is conducted with the greatest judgment. The attitude

titude of St. Paul is as fine as possible, pointing to the statue of Mercury, alluding to their idolatry; for the men of Lystra would call him by that name. The little drapery thrown over the apostle's shoulder, and hanging down to his waist, poises the figure, which otherwise would seem ready to tumble forwards.

There were in all twelve of these pieces: two are in the possession of the French king: the king of Sardinia has two of the others; and one belonged to a gentleman in England, who pledged it for a sum of money. When the person who had taken this valuable deposit found it was to be redeemed, he greatly damaged the drawing, for which the gentleman brought his action in Westminster-hall.

Perhaps there are few houses in Europe of its size, better worth the view of the curious in architecture, and the sitting up and furnishing great houses, than lord Spencer's, in St. James's Place. Nothing can be more pleasingly elegant than the park front, which is ornamented to an high degree, and yet not with profusion; we know not in England a more beautiful piece of architecture. Nor is the fitting up and furniture of the rooms inferior to the beauties of the outside. We were first shewn into lord Spencer's library, which is thirty feet by twenty-five; the ornaments exceedingly handsome. The chimney-piece very light, of polished white marble. On one side of the room hangs a capital picture of the nature of witchcraft; the expression and finishing is very great; and the extent of the painter's imagination striking, in drawing into one point such a multitude of the emblems of witchcraft, and all designed with a fine wildness of fancy. It is somewhat in the stile of Scarlatti.

From hence you enter the dining-room, forty-six by twenty-four; exceedingly elegant: the decorations in the finest taste, and the richest of their kind; the ceiling and cornice of white and green, very beautiful. The slabs of Siena marble, large and finely veined. The chimney-piece, basso relievo, of white marble beautifully polished. On one side of it is a landscape, the killing of a dragon, the general brilliancy of which is very fine, and the trees beautifully expressed. On the other side is another yet more pleasing, the trees of which are likewise striking. The figures are a centaur carrying off a naked woman: her back appears, which is painted with a most delicate softness: she has a little slight drapery, which is very elegantly designed, though perhaps not perfectly natural.

Next we entered the drawing-room, which is twenty-four by twenty-one, clear of a noble bow-window, parted from the room only by two pillars of most exquisite workmanship; they are carved in leaves, the thick foliage of which bends round in a fine arch from one to the other, in a taste that cannot be too much admired. On each side, in a semicircular cove in the wall, an urn of white marble with basso relievos, very beautiful. Nothing can be more elegant than the chimney-piece; a fine border of Siena marble with a sweet festoon of flowers upon it in white marble polished; the ceiling, cornice, and ornaments of green and white and gold, and in a most delicate stile. Over the chimney, a picture of two usurers; great expression.

Returning, we next viewed the Attic story; the staircase is in a very just taste, wide and lofty; the ceiling and ornaments green and white.

From the landing-place you enter first the music-room twenty-five by twenty-three, the chimney-piece extremely light and elegant: on the left a small dressing-room, very neat; chimney-piece very beautiful; the cornice of white polished marble, supported by pillars of Siena. This opens into the bed-chamber, twenty-five by twenty. The beds and tables very finely carved and inlaid, the former of crimson damask, with covered tops, and extremely elegant. Returning to the music-room, you enter the grand dressing-room, twenty-five by twenty-three, which is fitted up with all possible taste; scarce any thing can be more beautiful than the mosaic'd ceiling, the cornices, and all the ornaments. The chimney-piece is exquisitely designed, and admirably executed: it is of white marble, wrought with the

utmost taste, and beautifully polished. Over the cornice are festoons of the lightest carving, and two eagles, with a very fine basso relievo of carving in a glass in the centre. The pictures are disposed with great elegance, and hung up by ribbons of gilt carving in the sweetest taste. Among them are the following pieces:

Two old men's heads in the stile of Rembrandt; fine.

Ten pieces, companions, exceedingly beautiful; the colouring, attitudes, and drapery, very striking. Among them Andromade, rape of Europa, Venus, Neptune.

A battle by Borgognon, very fine.

Madona, dark, but good.

Nativity, fine,

A Christ, ditto.

Holy family, pleasing, but the drapery not excellent.

Landscape, I imagine by Claud Lorraine, fine.

Out of this room you enter the saloon, forty-five by thirty, that which we never beheld one fitted up and furnished in a more exquisite taste. The ceiling, which is coved, is in mosaic'd compartments, green and white and gold; gilt medallions are let into it. The door-cases exceedingly elegant, their cornices supported by pillars most beautifully carved, and gilt with the same mixture of green as in the ceiling. The chimney-piece large, but very light; relievos of white polished marble, wonderfully elegant. Between the windows are two slabs very large, of the finest Siena marble, the frames carved in the most exquisite taste, and richly gilded; they are beyond all comparison more beautiful and rich than any we have seen. The pier-glasses of a vast size, single plates, and the frames of admirable workmanship. The carving and gilding of the sofa frames in a stile and taste till now unknown. In the centre of the room hangs an exceeding fine glass lustre. On each side the chimney is an historical landscape, one Alexander and Diogenes; the expression good, but the colouring of both something of the Mannerist.

The next room is called the painted one, twenty-four by twenty-two. On one side is a bow-window, ornamented with the most exquisitely carved and gilt pillars you can conceive. The walls and ceiling are painted in compartments by Mr. Steuart, in the most beautiful taste; even the very scrolls and festoons of the slightest sort, which are run between the square and circular compartments, are executed with the minutest elegance. The ground of the whole is green; and the general effect more pleasing than is easily conceived. Nothing can be lighter or more beautiful than the chimney-piece: the frieze contains a most exquisite painting representing a clandestine marriage, which, without variety or glare of colours, has all the harmony of their utmost power. Nothing can be finer than the drapery, which is designed with the justest taste, displaying the form of every limb through it in a most beautiful manner. The soft expression of the naked, and the beauty of the heads, are very great. We should observe, that two of the small compartments of the wall are landscapes let into it with no other than the painted frame of the divisions: one represents a water-fall, and the other a bridge over a stream, both fine. The frames of the tables, sofas, stands, &c. &c. are all carved and gilt in the same taste as the other ornaments of the room, all with a profusion of richness, but with the utmost elegance. The peacock's feathers over one of the glasses, the turtles on a wreath of flowers, and the magpies on bunches of grapes, are very beautiful, and the deception of the first extraordinary. The bold relief of such slight strokes does honour to the pencil of the artist. The looking-glass window is a piece of taste, and has an happy effect.

North-west of the Queen's Palace, at the south-east corner of Hyde-park, in a fine situation, and a clear and pure air, is a neat plain building, which formerly belonged to lord Lansborough, but was, in the year 1733, taken and fitted up by a charitable society, for the reception of the sick and lame, by the name of St. George's Hospital. It was first opened, for the admission of patients, on the first day of January 1734, and has ever since been supported by voluntary subscriptions and donations, and so well attended and managed, that now

it is one of the most flourishing hospitals in the kingdom. The governors of this charity are about three hundred.

Near St. George's Hospital is a Lock Hospital, erected for the reception of persons afflicted with venereal disorders, and supported by voluntary subscriptions and donations.

Besides many noble private buildings in the parish of St. Martin, that have not been mentioned here, this parish contains the following additional public ones; two charity-schools, two alms-houses, a parish work-house, a round-house, and a play-house.

St. James's Church was built in the reign of Charles II. at the expence of Henry earl of St. Albans, and other neighbouring inhabitants; and was made parochial by act of parliament in 1685. The building is of brick and stone, about eighty-five feet long, sixty broad, and forty-five feet high, with a handsome steeple, one hundred and fifty feet in height.

St. James's Square is in the parish of St. James's, and is an area of at least four acres, built round chiefly with noblemen's houses, in the modern taste. In the middle of the square is a fine basin, surrounded with a gravel walk, and inclosed with an iron palisade.

In a street called Piccadilly, in the parish of St. James's, is Burlington-house, so called from its being the residence of the earls of Burlington. It is fenced from the street by a brick wall, about two hundred and twenty feet in length, in which are three coach-gates. The front of the house is of stone, and is remarkable for the beauty of the design and workmanship. It has two wings, joined by a circular colonnade of the Doric order. The front was built by the late earl of Burlington. The apartments are in a fine taste, and the stair-case painted with great spirit, by Seb. Ricci. Behind the house is a spacious garden.

In Piccadilly are several other magnificent houses, as Sunderland-house, Devonshire-house, and two new houses, one erected by the earl of Bath, and the other by the earl of Egremont. In this parish there are two chapels of ease, three charity-schools, two squares, two markets, part of a third, and a work-house for the parish poor.

The church of St. George the Martyr is a beautiful structure, near a square called Hanover-square. This was one of the fifty new churches erected within the bills of mortality, by act of parliament, in the reign of queen Anne. The ground for the church was given by the late lieutenant-general Stewart, who also left four thousand pounds to the parish, towards erecting and endowing a charity-school, which, by the additional benefactions and subscriptions of the parishioners, is become very considerable. In this parish are four chapels of ease, a work-house for the poor, and a market for meat and herbage.

Here are two spacious quadrangles of magnificent houses, called Hanover and Grosvenor Squares. Hanover Square consists of an area of about two acres: Grosvenor Square contains about five acres, and is laid out with gravel and green walks, and quickset bushes. It is inclosed with a balustrade upon a dwarf wall, and adorned in the centre with a gilt equestrian statue of king George I. on a pedestal.

In Duke-street, Grosvenor's Square, in this parish, is a lying-in-hospital, for unmarried as well as married women. It is supported by voluntary contributions; and any woman recommended by a governor or subscriber is received, and provided with assistance, and all necessaries, during the last stage of her pregnancy, and the month of lying-in.

Near Oxford-road, in this parish, is a plain but commodious brick building, called the Middlesex Hospital, for the reception of the sick and lame, and for lying-in married women. The first institution of this charity was in August 1745, in two houses adjoining to each other, in Windmill-street, Tottenham-court-road, in this neighbourhood; but the number of patients greatly increasing, this building was begun in 1755. The apartments for the reception of lying-in women are remote from those for the sick and lame. This hospital

is supported by charitable contributions. The number of beds at present is sixty-four; and the number of patients admitted, from the first institution to the beginning of June 1751, is fifteen thousand and thirty-nine, of whom one thousand eight hundred and twenty-nine were sick and lame, eleven thousand seven hundred and eighty-five were out-patients, and one thousand four hundred and twenty-five lying-in women.

St. Anne's parish being taken out of St. Martin's parish, by act of parliament in 1678, a church, dedicated to St. Anne, was finished in 1686, of brick and stone. The great ornaments of this parish are two squares, one called Soho Square, and the other Leicester Square. Soho Square is an area of three acres, surrounded with high palisades, inclosing a garden, in which is a statue of king Charles II. erected on a pedestal, placed in the middle of a small basin. At his feet lie the representation of the four principal rivers in England, the Thames, the Severn, the Tine, and the Humber. The north and west sides of Leicester Square are in this parish. Leicester Square is an area of between two and three acres. On the north side is Saville-house, the winter residence of his present majesty, while prince of Wales; and adjoining to that is Leicester-house, the residence of the princess dowager of Wales. This square is inclosed with iron rails, and in the centre is a gilt equestrian statue of king George II. on a high pedestal.

The greatest part of the parish of St. Paul Covent-garden was anciently a garden, belonging to the abbot and convent of Westminster, and was then properly called Convent-garden, a name since corrupted into Covent, and sometimes Common-garden. In 1552, king Edward VI. gave it to John earl of Bedford, together with a field near it, formerly called the Seven-acres, but now being turned into a long street, it is called Long-acre.

In 1640, Francis earl of Bedford erected a chapel for the use of his tenants, in and about Covent-garden, which chapel is now the parish-church; and in 1645, this precinct was separated, by act of parliament, from the parish of St. Martin's, and constituted an independent parish. The church was built by Inigo Jones, and is esteemed, by the best judges, one of the most simple and perfect pieces of architecture in the world. In the front is a plain portico of the Tuscan order: the columns are massy, and the intercolumniation large. This portico is defended by an iron palisade, and iron gates, the gift of the duke of Bedford. But what is most singular in the building is, that it has no pillars to support the roof, nor any tower, or bells to ring in peal. On each side of the front is a gate suitable to the structure.

There is a square before the church, called Covent-garden market, of which the church forms almost all the west side. This square contains about three acres of ground, and is the best market in England for herbs, fruit and flowers. It is surrounded by a wooden rail, and a column is erected in the middle of it, on the top of which are four sun-dials. There is a magnificent piazza on the north and east sides of this square, designed by Inigo Jones, which, if carried round it, according to the plan of this celebrated architect, would render it, beyond dispute, one of the finest squares in Europe.

There are two charity-schools in this parish, a theatre called Covent-garden Play-house, and a round-house.

Next to the parish of St. Paul Covent-garden is that of St. Mary le Strand, the church of which parish was called St. Mary le Strand, from its having been built in a capital street called the Strand, and dedicated to St. Mary. This is one of the fifty new churches that were erected within the bills of mortality by act of parliament, in the reign of queen Anne, and the first of them that was finished. It is a good, though not a very extensive piece of architecture. At the entrance on the west side, is an ascent by a slight of steps, cut in the sweep of a circle: these lead to a circular portico of Ionic columns, covered with a dome, which is crowned with a vase: the columns are continued along the body of the church, with pilasters of the same order at the corners; and in the

the intercolumniations are niches handsomely ornamented. Over the dome is a pediment, supported by Corinthian columns, which are also continued round the body of the structure, over those of the Ionic order: between these are the windows, placed over the niches: these columns are supported on pedestals, and have pilasters behind, with arches sprung from them; and the windows have angular and circular pediments alternately. A handsome balustrade is carried round the top of the church, and its summit is adorned with vases. The steeple is light, though solid, and ornamented with composite columns and capitals.

The most remarkable building in this parish is a royal palace, called Somerset-house, built by the duke of Somerset, uncle to king Edward VI. upon whose attainder it fell to the crown; and Anne of Denmark, queen to king James I. kept her court here, whence it was called Denmark-house during that reign; but it soon after recovered the name of the founder. It was the residence of queen Catharine, dowager of king Charles II. and was settled on the late queen Caroline, in case she had survived his late majesty. It consists of several courts, and has a garden behind situated on the bank of the Thames. The front towards the Strand is adorned with columns and entablature of the Doric order. The first court is a handsome quadrangle, built on all sides with free-stone. On the south side is a piazza, before the great hall or guard-room. Beyond this are other courts, which lie on a descent towards the garden and the Thames; and on the side of the river, king Charles II. added a magnificent structure of free stone, with a noble piazza built by Inigo Jones. This new building contains the royal apartments, which command a beautiful prospect of the river, and the country beyond it. The garden was adorned with statues, shady walks, and a bowling-green: but as none of the royal family have resided here since queen Catharine, several of the officers of the court, and its dependants, are permitted to lodge in it; and great part of it has been lately used as barracks for soldiers and recruits. The garden is totally ruined, and the apartments are become suitable to their new guests.

The parish next to St. Mary le Strand is St. Clement's Danes, so called from its church, which is supposed to be dedicated to pope Clement the First, who suffered martyrdom in the reign of the Roman emperor Trajan, and to be the church, or else the common coemetry of the Danes in London. A church has been situated in this place ever since the year 700 at least, but the present structure was begun in 1680. It was designed by Sir Christopher Wren, and is one of the best of all that were built before the fifty new churches. It is built of stone, has two series of windows, the lower plain, and the upper well ornamented; and the termination is by an Attic, the pilasters of which are crowned with vases. On the south side is a portico, covered with a dome, supported by Ionic columns; and opposite to this is another. It has a beautiful steeple, carried to a great height.

In this parish there are three inns of chancery, Clement's Inn, New Inn, and Lyon's Inn.

Clement's Inn is so called from its situation in the neighbourhood of St. Clement's church; it belongs to the Inner Temple, and consists of a hall and three courts, where the students of the law have had lodgings ever since the year 1478.

New Inn was so called in contradistinction to an old inn which belonged to this society, in Sea-coal Lane, near Fleet-ditch. It is situated in Wych-street, and joins to Clement's Inn. It is spacious and airy, consisting only of one well-built court, with a handsome hall, and small garden. This inn belongs to the Middle Temple, and is governed by a treasurer and twelve ancients.

Lyon's Inn is opposite to New Inn, and is said to have been in possession of the students and practitioners of the law ever since the year 1420. It belongs to the Inner Temple.

In this parish is an excellent market for butchers meat, poultry, and all sorts of garden stuff. It is called Clare-

market, from the family of Clare, dukes of Newcastle, who were the original proprietors of it.

Exeter Exchange is one of the most remarkable buildings in this parish. It had its name from its situation in the place where formerly the mansion-house of the earls of Exeter stood. It is a large building, erected for the benefit of trade, and consisting of a lower and upper floor. The lower floor is laid out into little shops, ranged on each side a long room; and the upper one is now used for auctions, and other such purposes.

Near Exeter Exchange is an ancient building, called the Savoy, from Peter earl of Savoy and Richmond, who first erected a house here in 1245. This house afterwards came into the possession of the friars of Montjoy, of whom queen Eleanor, wife of king Henry III. purchased it for her son, Henry duke of Lancaster. The duke afterwards enlarged and beautified it at an immense expence; and in the reign of Edward III. this was reckoned one of the finest palaces in England; but in 1381, it was burnt to the ground, with all its sumptuous furniture, by the Kentish rebels, under Wat Tyler. Henry VII. began to rebuild it in its present form, for an hospital for the reception of an hundred distressed objects; but the hospital was suppressed by Edward VI. who granted its furniture, together with seven hundred pounds a year of its revenues, to the hospitals of Christ's church, St. Thomas, and Bridewell. The Savoy has ever since belonged to the crown, and consists of a large edifice, built with free-stone and flint, in which detachments of the king's guards lie, where they have a prison for the confinement of deserters and other offenders, and lodgings for recruits. A part of the Savoy was allotted by king William III. to the French refugees, who have still a chapel here, which was the ancient chapel or church of the hospital.

Besides the cities and liberties of London and Westminster, which have been now described, there is a suburb to the north of vast extent, running the whole length of both. This must next be traced, beginning at the west, and proceeding eastward to the end.

The next parish to the liberties of Westminster, on the east, is that of St. Giles in the Fields. The church of this parish was built in 1734, and is one of the most simple and elegant modern structures in London. It is built of Portland stone, with a steeple one hundred and sixty-five feet high.

In this parish is one of the largest and most beautiful squares in London, if not in Europe, called Lincoln's Inn Fields. It was originally laid out by the celebrated Inigo Jones: the area contains about ten acres, in the middle of which is a basin of water, surrounded with grass and gravel walks, encompassed with an iron palisade, fixed upon a stone plinth. This square is bounded on the north, west, and south, with spacious and elegant buildings, and to the east with the wall of Lincoln's Inn-gardens. Between these bounds and the palisades is a spacious avenue for carriages, and a path for foot passengers, paved with broad flat stones, and secured by posts at proper distances.

In Brownlow-street, Long Acre, in this parish, is a lying-in hospital, supported by charitable contributions, for the relief of pregnant poor women, where such married women as are objects of charity, are amply provided with commodious apartments and beds, good nursing, plain suitable diet, proper medicines, and the advice and assistance of gentlemen of skill and experience in midwifery, as well as the attendance of midwives, in the last stage of their pregnancy, and during the month of lying-in.

There are in this parish two charity-schools, an alms-house, a work-house for the poor, and other charitable foundations.

The church of St. George, Bloomsbury, is one of the fifty new churches erected by act of parliament, and is distinguished from all the rest by standing south and north, and by the statue of king George I. at the top of its spire.

In this parish is the British Museum, formerly called Montague House, from having been the residence of the dukes of Montague. It was built in 1677; and in 1753,

the parliament having passed an act for purchasing the museum of the late Sir Hans Sloane, and the collection of manuscripts of the late lord Oxford, called the Harleian Library, for the use of the public, twenty-six trustees were appointed and incorporated, in order to provide a repository for these and some other collections, which repository was to be called the British Museum. These trustees elected fifteen other trustees, and having bought Montague house, repaired and fitted it up for the reception of these collections. They also appointed proper officers to superintend the museum; and having ordained certain statutes with respect to the use of the collection contained in it, the public were admitted to view it in 1757.

The British Museum is a large and magnificent building, and has a garden of near eight acres behind it. The collection of Sir Hans Sloane consists of a very great number of natural and artificial curiosities, valuable remains of antiquity, and a large library, which, together, cost the proprietor fifty thousand pounds. It was purchased by parliament for twenty thousand pounds; ten thousand pounds were paid for lord Oxford's manuscripts, ten thousand pounds more were laid out for the purchase of Montague house, fifteen thousand pounds were spent in repairs, alterations, and conveniencies; and thirty thousand pounds were vested in the public funds, for supplying salaries for officers, and other necessary expences.

As this noble collection of curiosities, and these excellent libraries, are now chiefly designed for the use of learned and studious men, both natives and foreigners, in their researches into the several parts of knowledge, the trustees have thought fit to ordain the following statutes, with respect to the use of the Museum.

I. That the Museum be kept open every day in the week, except Saturday and Sunday in each week; and likewise except Christmas-day, and one week after; one week after Easter-day and Whitsunday respectively; Good Friday, and all days which shall hereafter be appointed for thanksgivings and fasts by public authority.

II. That at all other times the Museum be set open in the manner following: that is, from nine o'clock in the morning till three in the afternoon, from Monday to Friday, between the months of September and April inclusive; and also at the same hours on Tuesday, Wednesday, and Thursday, in May, June, July, and August; but on Monday and Friday, only from four o'clock to eight in the afternoon, during those four months.

III. That such studious and curious persons, who are desirous to see the Museum, be admitted by printed tickets, to be delivered by the porter upon their application in writing; which writing shall contain their names, condition, and places of abode; as also the day and hour at which they desire to be admitted: and that the said names be inserted in the tickets, and, together with their respective additions, entered in a register to be kept by the porter. And the porter is to lay such register every night before the principal librarian; or, in his absence, before the under librarian, who shall officiate as secretary for the time being; or, in his absence, before one of the under librarians; to the end that the principal or under librarian may be informed, whether the persons so applying be proper to be admitted according to the regulations made, or to be made by the trustees for that purpose. And if he shall judge them proper, he shall direct the porter to deliver tickets to them, according to their request, on their applying a second time for the said tickets.

IV. That no more than ten tickets be delivered out for each hour of admittance; which tickets, when brought by the respective persons therein named, are to be shewn to the porter, who is thereupon to direct them to a proper room appointed for their reception, till their hour of seeing the Museum be come, at which time they are to deliver their tickets to the proper officer of the first department: and that five of the persons producing such tickets be attended by the under librarian, and the other five by the assistant in each department.

V. That the said number of tickets be delivered for the admission of company at the hours of nine, ten,

eleven, and twelve respectively in the morning; and for the hours of four and five in the afternoon of those days in which the Museum is to be open at that time: and that if application be made for a greater number of tickets, the persons last applying be desired to name some other day and hour, which will be most convenient to them.

VI. That if the number of persons producing tickets for any particular hour does not exceed five, they be desired to join in one company; which may be attended either by the under librarian, or assistant, as shall be agreed on between them.

VII. That if any persons, having obtained tickets, be prevented from making use of them, they be desired to send them back to the porter in time, that other persons wanting to see the Museum may not be excluded.

VIII. That the spectators may view the whole Museum in a regular order, they are first to be conducted through the apartment of manuscripts and medals; then the department of natural and artificial productions; and afterwards the department of printed books, by the particular officers assigned to each department.

IX. That one hour only be allowed to the several companies, for gratifying their curiosity in viewing each apartment, and that each company keep together in that room in which the officer who attends them shall then be.

X. That in passing through the rooms, if any of the spectators desire to see any book, or other part of the collection, not herein after excepted, it be handed to them by the officer, who is to restore it to its place before they leave the room; that no more than one such book, or other part of the collection, be delivered at a time; and that the officer be ready to give the company any information they shall desire, relating to that part of the collection under his care.

XI. That upon the expiration of each hour, notice be given of it; at which time the several companies shall remove out of the apartment in which they then are, to make room for fresh companies.

XII. That if any of the persons who have tickets, come after the hour marked in the said tickets, but before the three hours allotted them are expired, they be permitted to join the company appointed for the same hour, in order to see the remaining part of the collection, if they desire it.

XIII. That a catalogue of the respective printed books, manuscripts, and other parts of the collection, distinguished by numbers, be deposited in some one room of each department, to which the same shall respectively belong, as soon as the same can be prepared.

XIV. That written numbers, answering to those in the catalogues, be affixed both to the books and other parts of the collection, as far as can conveniently be done.

XV. That the coins and medals, except such as the standing committee shall order, from time to time, to be placed in glass cases, be not exposed to view, but by leave of the trustees, in a general meeting; or the standing committee, or of the principal librarian: that they be shewn between the hours of one and three in the afternoon by one of the officers, who have the custody of them: that no more than two persons be admitted into the room to see them at the same time, unless by particular leave of the principal librarian, who in such case is required to attend, together with the said officer, the whole time: and that but one thing be taken or continue out of the cabinets and drawers at a time, which is to be done by the officer, who shall replace it before any person present goes out of the room.

XVI. That the Museum be constantly shut up at all other times, but those above-mentioned.

XVII. That if any persons are desirous of visiting the Museum more than once, they may apply for tickets in the manner above-mentioned, at any other times, and as often as they please; provided that no one person has tickets at the same time for more days than one.

XVIII. That no children be admitted into the Museum.

XIX. That no officer or servant shall take any fee or reward of any person whatsoever, for his attendance in

the discharge of his duty, except in the cases hereafter mentioned, under the penalty of immediate dismissal.

The manner of admitting persons who desire to make use of the Museum for study, or have occasion to consult it for information.

I. That no one be admitted to such use of the Museum for study, but by leave of the trustees, in a general meeting, or the standing committee; which leave is not to be granted for a longer term than half a year, without a fresh application.

II. That a book be kept in the reading-room, under the custody of the officer of the said room, who is to enter therein the names of the several persons who have leave of admission, together with the respective dates of the orders of the trustees for that purpose, and the duration of the same.

III. That a particular room be allotted for the persons so admitted, in which they may sit, and read or write, without interruption, during the time the Museum is kept open: that a proper officer do constantly attend in the said room, so long as any such person or persons shall be there: and for the greater ease and convenience of the said persons, as well as security of the collection, it is expected, that notice be given in writing the day before, by each person, to the said officer, what book or manuscript he will be desirous of perusing the following day; which book or manuscript, on such request, will be lodged in some convenient place in the said room, and will from thence be delivered to him by the officer of the said room; excepting however some books or manuscripts of great value, or very liable to be damaged, and on that account judged by the trustees not fit to be removed out of the library to which they belong, without particular leave obtained of the trustees in a general meeting, or a standing committee for that purpose; a catalogue whereof will be kept by the officer of the reading-room.

IV. That such persons be allowed to take one or more extracts from any printed book or manuscript; and that either of the officers of the department to which such printed book or manuscript belongs, be at liberty to do it for them, upon such terms as shall be agreed on between them.

V. That the transcriber do not lay the paper on which he writes upon any part of the book or manuscript he is using.

VI. That no whole manuscript, nor the greater part of any, be transcribed, without leave from the trustees, in a general meeting or standing committee.

VII. That every person so intrusted with the use of any book or manuscript, return the same to the officer attending, before he leaves the room.

VIII. That if any person engaged in a work of learning, have occasion to make a drawing of any thing contained in the department of natural and artificial productions, or to examine it more carefully than can be done in the common way of viewing the Museum, he is to apply to the trustees in a general meeting, or the standing committee, for particular leave for that purpose; it not being thought proper, unless in particular cases, to have them removed from their places, and out of the sight of the officer who has the care of them.

IX. That whensoever, and as often as any person shall have occasion to consult or inspect any book, charter, deed, or other manuscript for evidence or information, other than for studying, which is herein before provided for; he is to apply for leave so to do, to the trustees in a general meeting, or the standing committee. But if the case should require such dispatch as that time cannot be allowed for making such application, the person is to apply for such leave to the principal librarian; or, in case of his death or absence, such of the under librarians as shall officiate as secretary for the time being: which leave the principal librarian, or the under librarian officiating as secretary for the time being, as aforesaid, is hereby empowered to grant. Provided always, that no such person shall be permitted to consult or inspect any such book, charter, deed, or other manuscript, except in the presence of the principal librarian, or of one of the principal officers of that de-

partment to which such book, deed, charter, or other manuscript, shall belong.

X. That no part of the collection or collections belonging to this Museum, be at any time carried out of the general repository, except such books, charters, deeds, or other manuscripts as may be wanted to be made use of in evidence. And that when any such book, charter, deed, or other manuscript, shall be wanted to be made use of in evidence, application shall be made in writing for that purpose, to the trustees in a general meeting, or the standing committee: and if the case should require such dispatch, as not to admit of an application to the trustees in a general meeting, or the standing committee, then to the principal librarian; or in case of his death or absence, then to such of the under librarians as shall officiate as secretary for the time being: and thereupon, by their or his direction, the same shall, and may be carried out of the general repository, to be made use of as evidence as aforesaid, by the under librarian or assistant of the department to which such book, charter, deed, or other manuscript, shall belong. And in case the said under librarian or assistant of the said department be disabled, or cannot attend, then by such other of the under librarians or assistants as shall be appointed by the trustees, in a general meeting, or the standing committee, or by the chief librarian, or by such of the under librarians as shall officiate as secretary for the time being aforesaid. And the person who shall be appointed to carry out the same, shall attend the whole time, and bring it back with him again; for which extraordinary trouble and attendance it is expected that a proper satisfaction be made to him.

Although it may be presumed, that persons who shall be admitted to see the Museum, will in general conform themselves to the rules and orders above-mentioned; yet as it may happen, that these rules may not always be duly observed, the trustees think it necessary, for the safety and preservation of the Museum, and do hereby order, that in case any persons shall behave in any improper manner, and contrary to the said rules, and shall continue such misbehaviour after having been admonished by one of the officers; such persons shall be obliged forthwith to withdraw from the Museum, and their names shall be entered in a book to be kept by the porter, who is hereby ordered not to deliver tickets to them for their admission for the future, without a special direction from the trustees in a general meeting.

In this parish is a square of about three acres, called Bloomsbury Square, with many fine houses: the north side is entirely taken up with Bedford-house, which was designed by Inigo Jones, and is an elegant structure. The area of this square is surrounded with iron rails. Near the square is a good market, called Bloomsbury market.

St. George's church, Queen Square, another of the fifty new churches, is a plain building, erected in 1723, and was formerly a chapel of ease to St. Andrew's church in Holborn.

In this parish are two very fine squares, each consisting of about four acres: one is called Queen Square, and is inclosed with very good houses on all sides, except the north, where it lies open to the fields, which renders it very airy and pleasant. The other square is Red Lion Square, and is railed in, and adorned with an obelisk in the centre.

In Great Ormond-street, in this parish, is Powis-house, thus called from its having been the town residence of the duke of Powis. It is reckoned one of the most beautiful buildings in and about London. In this street is also the house of Charles Jennens, Esq; in which is one of the most capital collections of paintings in England.

In Lamb's Conduit Fields, in this parish, is a large and commodious structure called the Foundling Hospital, for the reception of exposed and deserted children. It consists of two wings, and a chapel in the centre, and is built of brick. Before the hospital is a large piece of ground, on each side of which is a colonade of great length, which also extends towards two gates, separated by a massy pier, in such a manner, that coaches may pass

pass and repass at the same time; and on each side of the gates is a door for persons on foot. The area between the outer gate and the hospital is adorned with grass-plats, gravel walks, and lamps, erected upon handsome posts; and behind it are two handsome gardens.

This laudable charity was first projected by several eminent merchants, in the reign of queen Anne, who proposed to erect an hospital for the reception of deserted infants, and to employ them in such a manner, as to render them useful members of society: they proposed a subscription, and solicited a charter; and though they did not succeed at that time, some of them left large sums for the use of such an hospital, in case it should ever be erected.

This circumstance coming to the knowledge of Mr. Thomas Coram, a commander of a ship in the merchants service, he applied himself to solicit a charter for the establishment of such a charity; and with unwearied assiduity, spent the remainder of his life in promoting this design.

Having obtained a recommendation of his scheme from several persons of distinction, he procured not only a large subscription to carry on the building, but, upon a petition to the king, his majesty granted a charter for establishing this hospital, dated the seventeenth of October, 1739; and afterwards an act of parliament was obtained to confirm and enlarge the powers granted by his majesty to the governors and guardians of the hospital.

As the building an hospital would necessarily take up much time, the governors hired a large house in Hatton Garden; nurses were provided, and it was resolved that sixty children should be admitted, which was accordingly done on the twenty-fifth of March, 1741. The foundation of the hospital being laid the sixteenth of September, 1742, one wing was finished in 1745, upon which the children were removed from the house in Hatton Garden to the new hospital. A chapel being now much wanted, the first stone of one was laid the first day of May 1747, and the building was completed on the twenty-ninth of March, 1749.

The general court being informed of the increase of benefactions to this charity, and of the great number of children already in it, were of opinion, that the boys should be kept separate from the girls; for which end they gave directions for building the other wing of the hospital; and by the diligence of the governors, and the bounty of the public, the whole was completed before the first of January, 1753. The governors, however, found it necessary to limit the number of children taken in. But on the tenth of March, 1756, they petitioned the parliament for pecuniary assistance, that they might enlarge their plan. Upon this, the parliament granted them ten thousand pounds, and ordered, that all children under two months old, that should be brought before the thirty-first of December then next, should be admitted. On the seventeenth of January 1757, the parliament granted them the farther sum of thirty thousand pounds, and ordered, that all children under six months old, that should be brought before the first of January, 1758, should be admitted. From the time this charity was made general, about six thousand infants were annually received; but it appearing, that nearly one third of them died at nurse, and that further assistance, to a still larger amount, would be necessary, the parliament, either because the institution was not thought to answer its end, which was the preservation of life, or because the necessary sums were thought too large to burden the public with, ordered the hospital to be shut up on the twenty-fifth of March, 1760.

The buildings are neat and substantial, without any costly decorations.

In the court-room are placed four capital pictures, taken from sacred history.

1. The delivering of Moses to his mother, Exod. ii. 8, 9. By Mr. Hayman.
2. Moses brought to Pharaoh's daughter. By Mr. Hogarth.
3. The history of Ishmael, Gen. xxi. 17. By Mr. Highmore.

4. Christ receiving the little children, Luke xviii. 16. By Mr. Wills.

Over the chimney is a bas relief, representing children employed in husbandry and navigation. By Rysbrack.

In the other rooms of the hospital are the portraits of Mr. Thomas Coram, by Mr. Hogarth. Mr. Milner and Mr. Jacobson, by Mr. Hudson. Dr. Mead, by Mr. Ramsley. Mr. Emerson, by Mr. Highmore.

In the dining-room is a large and beautiful sea-piece of the English fleet in the Downs, by Mr. Monamy.

Over the chimney, in another room, is Mr. Hogarth's original painting of the March to Finchley.

In the chapel, the altar-piece, painted by an Italian painter, represents the wise men making their offerings. The fine organ was presented by Mr. Handel.

Gray's Inn is one of the four principal inns of court, which, though it lies within the limits of the parish of St. Andrew, Holborn, is yet without the liberties of the city of London. It took its name from a noble and ancient family of the name of Gray, which formerly resided here; and in the reign of Edward III. demised it to some students of the law; but it is said to have been afterwards conveyed to the monks of Shene, near Richmond in Surry, a few miles south-west of London, who leased it to the society of the inn, by which tenure they held it, till the dissolution of monasteries, when Henry VIII. granted it to them in fee farm, for the same rent which has been paid to the crown ever since.

This inn consists chiefly of two very handsome quadrangles, one of which is called Coney Court, and was built in 1687, and one side of it contains a hall, a chapel, and a library. The hall is a fine old structure, well built of timber, in the form of a college hall. The chapel is a Gothic building, lately beautified and repaired. The library is well furnished with books in various faculties and languages, for the use of the students. But the chief ornament belonging to this inn is a spacious garden, consisting of gravel walks, between lofty trees, of grass-plats, agreeable slopes, and a long terrace, with a portico at each end. The terrace is ascended by a handsome flight of steps.

Lincoln's Inn, another of the four principal inns of court, was originally the palace of Ralph Nevill, bishop of Chichester, and chancellor of England, about the year 1226.

This palace, which also stood in the parish of St. Andrew, Holborn, without the city, came afterwards into the possession of Henry earl of Lincoln, who converted it into a court for the students of the law, about the year 1310. From him it was called Lincoln's Inn, and consisted only of what is now called the Old Square, which is entered from Chancery Lane. This square has since received several additional buildings; and now contains, besides buildings for the students, a large hall, where the lord chancellor hears causes in the sittings after term, and a chapel, built in the Gothic stile, upon pillars, by Inigo Jones, in the year 1623. The windows are painted with the figures of many persons mentioned in the sacred writings, at full length, and the arms of several members of the society; and under it there is an ambulatory, or walk, paved with broad stones. In this square is also a good library.

The New Square contains three rows of spacious and elegant buildings; one on the south, one on the east, and one on the west side: the north side is open to a large garden, which has a terrace, commanding Lincoln's Inn Fields, of which it makes one complete side: the south and west sides are in the parish of St. Clement's Danes, and the east side is in the liberty of the Rolls.

In the middle of this square is a fluted Corinthian column, which stands in the centre of a small basin, surrounded with iron palisades: at the four corners of the basin are four boys, through which the water of the basin used to rise, and fall back in a fountain of four jets; and on the top of the column is a sun-dial, with four sides. The square is separated from the gardens by iron palisades; and the greatest part of the west side is taken up by the offices belonging to the stamp duty.

St. James's

St. James's church, Clerkenwell, was part of a church belonging to an ancient priory, dedicated to St. James the Less. This church was rebuilt about the year 1623. Clerkenwell was so called from a celebrated fountain at one end of a green, called Clerkenwell Green, at which the parish clerks of London used to meet annually, and exhibit dramatic representations of certain scripture histories, before the lord mayor, citizens, and some of the nobility.

In Cold Bath Fields, in this parish, is a very plain, but neat structure, called the Small Pox Hospital, for the relief of the poor in that disease, being the only hospital of the kind in Europe. It was instituted in 1746, and is supported by voluntary contribution.

It has an elegant house belonging to it, near the New Road, Islington, in this neighbourhood, for preparing such patients as are to be inoculated. The sums received for the support of this hospital, from its first institution, amount to twenty-four thousand nine hundred and twenty-six pounds. There have been received into the house, during that time, seven thousand nine hundred and forty-six patients, who had the small-pox the natural way, of whom two thousand nine hundred and sixteen have been cured, and one thousand and thirty have died; four thousand six hundred and ninety-eight patients have been inoculated, of whom six only are said to have died.

South-east of St. James's church is a square, called St. John's Square, being built on the site of an hospital or religious house, belonging to the knights of St. John of Jerusalem. The square, which is of an irregular figure, consists of three piles of building, which form the north, the west, and the east sides. In the east side, near the north end, is the church of St. John, Clerkenwell, which was till lately a chapel of ease to St. James's. The south side consists of the old gateway of the hospital, in form of a castle, with battlements at the top, and a square tower on each side, and is called St. John's Gate.

In this parish is a building called Hicks's Hall, being the session-house for the justices of the peace for the county of Middlesex. This building had its name from Sir Baptist Hicks, a mercer in Cheapside, and a justice of the peace, who erected it in 1612. Here the grand jury meet eight times a year, to find bills of indictment against the criminals who are to be tried at the sessions-house in the Old Bailey. Hicks's Hall is a plain brick building, with a portico at the entrance.

In this parish are an alms-house, three charity-schools, a market for sheep-skins, two work-houses, a house of correction, a prison, and the New River water-works.

Various were the projects, in the reigns of queen Elizabeth and king James I. for supplying the city of London with a sufficient quantity of water, for domestic uses. The former granted an act of parliament, which gave the citizens liberty to cut and convey a river from any part of Middlesex or Hertfordshire to the city of London, within the limited time of ten years; and the latter granted another act, in which they obtained the same power, but without being confined to any limited time: nobody however began this great and important work, till at last Sir Hugh Middleton undertook to bring a river from Amwell in Hertfordshire, to the north side of London, near Islington.

The work began on the twentieth of September 1608, and was attended with innumerable difficulties. The distance from London is twenty miles, and he was obliged, in order to avoid the eminences and vallies in the way, to make it run a course of thirty-eight miles three quarters, and sixteen poles, and to carry it over two vallies in long wooden frames or troughs lined with lead; that at Buthill, being six hundred and sixty feet in length, and thirty in height; under which, for the passage of the land waters is an arch capacious enough to admit under it the largest waggon laden with hay or straw: the other near Highbury is four hundred and sixty-two feet long, and seventeen in height, where it is raised along the top of high artificial banks, and at the bottom of the hollow supported by poles, so that any person may walk under it. In short, over and under this river, which sometimes rises thus high, and at others

is conveyed under ground, run several considerable currents of land waters, and both above and below it a great number of brooks, rills, and water-courses, have their passage.

This river, which is of inestimable benefit to London, was by this truly great man brought to the city within the space of five years, and was admitted into the reservoir near Islington on Michaelmas day 1613; on which day Sir Thomas Middleton, brother to the great Sir Hugh, was elected lord mayor for the ensuing year, who accompanying Sir John Swinerton, then lord mayor, attended by many of the aldermen, the recorder, and other gentlemen, repaired to the basin, now called New River Head, when about sixty labourers, handsomely dressed, and wearing green caps, carrying spades, shovels, and pick-axes, marched, preceded by drums and trumpets, thrice round the basin, when stopping before the lord mayor, aldermen, and other gentlemen, who were seated upon an eminence, one of the labourers addressed himself to them in a long copy of verses, which being ended, the sluices were opened, and the stream ran plentifully into the reservoir, under the sound of drums and trumpets, the discharge of several pieces of ordnance, and the loud acclamations of the people.

Sir Hugh Middleton, to enable himself to complete this grand work, had at last, after spending his own fortune, been obliged to apply to king James I. who advancing a sum of money, became entitled to a moiety of the profits: he was also obliged to sell many other shares, and in short, was in a manner entirely ruined by a project, that has been attended with unspeakable benefit to this city; since, by the water of this river, a speedy stop has been put to a great number of dreadful fires, and the health of the city has been remarkably preserved by the cleanliness it has introduced among us. Yet so little were the great advantages that might then, and are now derived from this river, at that time understood, that for above thirty years, there were not divided above five pounds odd money, to each of the shares, which are seventy-two in number.

This river now draws most of its water from the Lee, which being the property of the city of London, that corporation, contrary to the interest of the city in general, opposed a bill brought into parliament for giving farther powers to the New River Company, to take the advantage that might be obtained by the river Lee: but the opposition was without effect, and in 1738-9, the bill passed into a law.

The governors of the New River company then agreed with the proprietors of the lands on the river Lee for a cut of two cubic feet of water from that river, at a certain rate; and after the agreement, told them, they would double the price for a four foot cut, which the proprietors agreed to, not considering the great disproportion between the two cuts; and this cut of the river Lee now supplies the largest share of the New River water.

In this river there are forty-three sluices, and over it two hundred and fifteen bridges. On its approaching the reservoir, called New River Head, there are several small houses erected at a considerable distance from each other on its banks, into which the water runs, and is conveyed by pipes to the nearer and more easterly parts of this metropolis. On its entering the above reservoir, it is there ingulphed by fifty-eight main pipes, each of seven inches bore, and here also an engine, worked by horses, throws a great quantity of water up to another reservoir, situated on much higher ground, from which the water runs in pipes to supply the highest ground in the city, and its liberties. Many years ago, thirty thousand houses were thus supplied by this water, and since that time, several main pipes have been laid, to carry it into the liberties of Westminster.

This corporation consists of a governor, deputy governor, treasurer, and twenty-six directors: these twenty-nine are the proprietors of the first thirty-six shares; for though the crown's moiety is in private hands, yet they have no share in the management. The above governor and directors keep their office at a coffee-house in Ludgate-street, where every Thursday they hold a board

for appointing of officers, granting of leafes, and redressing of grievances.

The officers and servants belonging to the company are, a clerk and his assistant; a surveyor and his deputy; fourteen collectors, who, after deducting five pounds *per cent.* for collecting the company's rents, pay their money every Thursday to the treasurer; fourteen walksmen, who have their several walks along the river, to prevent throwing into it filth, or infectious matter; sixteen turncocks; twelve pavours; twenty borers of pipes; besides horse engines for boring of others, together with a great number of inferior servants and labourers.

In the same parish of St. James, Clerkenwell, is an hospital called the Charter-house, which is a corruption of the word *chartreux*, a name formerly used for a convent or priory of the Carthusians.

This edifice was originally a religious foundation. In the year 1349, a terrible pestilence swept off more than half the inhabitants of London; and the churchyards being unable to contain the dead, Sir Walter Manny, Bart. a foreign gentleman, who had been honoured with the order of the garter by king Edward III. for his bravery in the field, purchased for a burial-ground a spot of thirteen acres, where the Charter-house now stands, and fifty thousand persons are said to have been buried there in the space of that year.

The following year that public benefactor built a chapel upon the spot, according to the religion of those times, for prayers to be said for the souls of all who had been interred there, and afterwards founded a monastery of the Carthusians in the same place.

This monastery being dissolved at the Reformation, at length fell to the earl of Suffolk, who disposed of it to Thomas Sutton, Esq; a citizen of London, for thirteen thousand pounds. The latter then applied to king James I. for a patent for his intended charitable foundation, which was readily granted in the year 1611, and confirmed by parliament in 1628. The expence of fitting up the house for the reception of his pensioners and scholars, amounted to seven thousand pounds, which added to the purchase money, made twenty thousand pounds. But this was not all; he endowed his hospital and school with fifteen manors, and other lands, to the value of above four thousand four hundred and ninety pounds *per annum*; and the estate is at present improved to above six thousand pounds a year.

In this house are maintained eighty pensioners, who, according to the institution, are gentlemen, merchants, or soldiers, who are fallen into misfortunes. These are provided with handsome apartments, and all the necessaries of life, except cloaths, instead of which each of them is allowed a gown, and seven pounds *per annum*.

There are also forty-four boys supported in the house, where they have handsome lodgings, and are instructed in classical learning, &c. Besides these, there are twenty-nine students at the universities, who have each an allowance of twenty pounds *per annum* for the term of eight years. Others who are judged more fit for trades, are put out apprentices, and the sum of forty pounds is given with each of them. As a farther encouragement to the scholars brought up on this foundation, there are nine ecclesiastical preferments in the patronage of the governors, who, according to the constitution of the hospital, are to confer them upon those who were educated there.

The pensioners and youths are taken in at the recommendation of the governors, who appoint in rotation.

The buildings, which are extremely rude and irregular, have nothing but their convenience and situation to recommend them. The rooms are well disposed, and the square in the front is very neat, and kept in as good order as most in town. This square, and the large gardens behind, give a free air, and at one and the same time contribute both to health and pleasure.

The next parish to St. James's, Clerkenwell, is that of St. Luke, so called from the parish church, which is dedicated to St. Luke, and commonly called Old-street church. It is one of the fifty new churches, erected according to act of parliament. It was finished in 1732, and is a noble structure.

In this parish is the Artillery Ground, where the artillery company and trained bands of the city of London are exercised. It consists of eleven acres of ground, walled round, with iron gates, and was demised in the year 1641, to Sir Paul Pindar, and others, in trust, for the artillery company for one hundred and thirty-nine years, as a military field for erecting an armoury and other offices, which are neatly built of brick.

In Pesthouse Row, in this parish, is an alms-house, founded by George Palyn, citizen and girdler, for six poor members of his company, and endowed with an estate of forty pounds a year, of which the company is trustee.

Near Palyn's alms-house, the French have an hospital, erected in 1717, the governors of which were incorporated the year following, by the title of 'The governor and directors of the hospital for the poor French protestants and their descendants, residing in Great Britain.' Here are upwards of two hundred poor men and women, of whom above one half are upon the foundation, and provided with all necessaries at the expence of the hospital; but the rest are paid for by their friends, at nine pounds a year each. By this charity a large infirmary is also provided for lunatics: a chaplain, physician, surgeon, and other proper officers, are maintained for this foundation.

In Pesthouse Fields, in this parish, is an house, erected in 1672, by the viscountess Lumley, for the accommodation of six poor women of Aldgate and Bishopsgate parishes, with an allowance of four pounds, and twelve bushels of coals *per annum*, each.

In Pesthouse Lane is an alms-house, founded, in 1616, by Edward Alleyn, a comedian, for ten poor men and women, who receive six-pence a week each, and every other year a coat or gown.

In George-yard, Old-street, in this parish, an alms-house was erected in 1655, by Susan Amyas of London, widow, for the habitation of eight poor single men or women, who are allowed, as a body, twenty shillings a year for water, and six pounds a year for coals: each of them has a separate allowance of four pounds a year; and twenty shillings a year are settled for one of the eight to read prayers every day.

In this parish there are three charity-schools, one free school, and a work-house for the reception of the poor.

St. Leonard's church, in Shoreditch, is said to have been a place of worship in the time of the Saxons; but the old church being much decayed, the present structure was begun in 1736.

One of the most considerable public buildings in this parish is an hospital called the Haberdashers Alms-house, or Aske's Hospital, from its having been erected in 1692, by the company of haberdashers, pursuant to the will of Robert Aske, Esq; one of their members, who left thirty thousand pounds for the building, and the relief of twenty poor members of the company of haberdashers; besides the maintenance and education of twenty boys, sons of decayed freemen of the same company. This is a sumptuous edifice of brick and stone, four hundred feet long, with an ambulatory in front of three hundred and forty feet, under a piazza, elevated on stone columns of the Tuscan order. In the middle of the building is a chapel, adorned with columns, entablature, and pediment of the Ionic order: and under the pediment is a niche, with a statue of the founder. The men, who are all to be single, have each an apartment of three rooms, with proper diet and firing, a gown once in two years, and three pounds a year in money. The boys have also a ward to themselves, with all necessaries: their master, who reads prayers twice a day in the chapel, has, besides a house, forty pounds *per annum*, which, together with the salaries of the clerk, butler, porter, and other domestics, amounts to about eight hundred pounds a year.

Ironmongers hospital, or, as it is often called, Jefe-ries's Alms-house, is a large handsome building in Kingsland-road, in this parish. It is built of brick, and is two stories high. It consists of a spacious front, with two wings, and a chapel in the centre, and was erected by the company of ironmongers in 1713, pursuant

suant to the will of Sir Robert Jefferies, formerly lord mayor of London, for the reception of fifty-six poor members of the ironmongers company, who, besides a convenient room and part of a cellar, have each six pounds a year, and a gown. A chaplain, who reads prayers every day, has a salary, and a distinct apartment. No man is admitted under fifty-six years of age; and if married, his wife may cohabit with him, and be elected in his room when he dies.

In this parish there are eight alms-houses, two charity-schools, and a large work-house for the poor.

Christ's church in Spittlefields is one of the fifty new churches. The foundation of it was laid in 1723, and it was finished in four years. In this parish there are two French and two English alms-houses, two charity-schools, and a work-house for the poor.

In the parish of St. Mary, Whitechapel, and near a place called Whitechapel-mount, is a large and commodious brick building, called the London Infirmary, erected very lately by voluntary contributions.

It is supported by charitable contributions, for the relief of all sick and diseased persons; and, in particular, manufacturers, seamen in the merchants service, and their wives and children.

This charity was instituted on the second of November 1740, in a large house in Precot-street, Goodman's Fields, which is now the Magdalen hospital: but that becoming too small for this extensive charity, a new, more capacious, and more commodious building, was erected by the voluntary contributions of several governors, in an airy situation, near the Mount in Whitechapel road.

This is a very neat brick building, contrived to be plain and yet elegant, without being very expensive; and it consisting of one extended front, without either wings or inner courts, the whole is seen at one view. To the middle door is an ascent by a flight of steps, and over this part extends a very large angular pediment, within which is a dial. Above the ground floor extend two series, of each twenty-three sash windows, their number and the length of the building giving it an air of dignity. The architect has properly considered the use for which it is designed, and has suited every thing to convenience. It is properly furnished, and fitted up with about one hundred and sixty beds for the reception of the patients.

The society for carrying on this laudable undertaking consists of a president, two vice presidents, and a treasurer, annually elected out of the most considerable benefactors to this charity, and of such persons, who by giving a benefaction of thirty guineas or more at one time, become governors for life; and those who subscribe five guineas or more a year, are governors during such subscription.

A general court of governors is held in the months of March, June, September, and December, to take the report of the committees, elect a house committee for the ensuing quarter, inspect accounts, and transact such other business as may be then laid before them. The anniversary feast of this charity is held between the first of February and the last day of April, when a printed account of the general state of the hospital, the number of patients received and discharged, and an abstract of the accounts for the year past, is laid before them.

A house committee of thirteen governors is appointed at every general quarterly court, who at their first meeting elect a chairman to preside for the first quarter, who meet at the hospital on Tuesdays weekly, at eleven in the forenoon, to receive and dismiss patients, to order and inspect the provisions and furniture sent in, and such necessaries that may be wanting, and to examine and regulate the conduct of the servants and patients, and other matters which come before them, according to the constitution of this charity. All governors that please to attend, have a vote at this committee, and their attendance is esteemed a favour.

A committee of accounts, consisting of twelve governors, is appointed at the general quarterly court in June, for one year, who meet at the hospital once a quarter, to

examine and audit tradesmen's bills, which are paid by the treasurer within a fortnight after. The accounts are open at all times for the inspection of the governors.

A physical committee, consisting of all such governors who practise physic, surgery, or pharmacy, or are conversant in the knowledge of drugs or medicines (excepting such as shall be directly or indirectly concerned in serving the hospital with such necessaries) are summoned by order of the chairman of the house committee for the time being every first Thursday in the month, and have power to order and inspect the necessary drugs and medicines, and report their proceedings to the general quarterly court by their chairman.

Two governors are appointed visitors by the house committee, for one fortnight, to attend twice a week, or oftener, if they think proper, to inspect into the management and conduct of the house, during the interval of the meetings of the house committee.

A clergyman of the church of England reads prayers every day, and preaches every Sunday, and reads prayers morning and afternoon; administers the sacrament regularly every month; and is ready to visit, pray by, and administer the sacrament at all times when required, to the patients in the wards.

Three physicians attend alternately; two of the surgeons daily, from eleven o'clock till one, without fee or reward, and give their advice and assistance to all such objects as come within those hours, whether recommended or accidental. A surgeon extraordinary attends in consultation, in all dangerous cases. The surgeons in waiting have an apprentice, or pupil, constantly in the house, to receive, and, if necessary, to call the surgeon to such accidents as shall be brought in at any hour of the day or night.

An apothecary (with an assistant) constantly resides at the hospital, who compounds and dispenses all medicines used there, and solely attends the business thereof.

A steward (for whose fidelity proper security is given) has the charge of the house and furniture, keeps an account of every thing brought to or expended in the house, and subjects the same to the examination of the visitors and house committee, and has the inspection likewise of the conduct of all the men-servants. Two matrons have the direction of the nurses and other women-servants, and see the diet and medicines administered according to order. Under them are nurses and watchers, in proportion to the number of patients, who are guided by written orders, to prevent any misconduct. Proper diet for the patients has been settled by the physicians and surgeons engaged in this charity, and is fixed up in the wards for the satisfaction of the patients and their friends.

No officers or servants are permitted, upon pain of expulsion, to take of any tradesmen, patients, or other persons, any fee, reward, or gratuity of any kind, directly or indirectly, for any service done, or to be done, on account of this hospital.

Every governor is intitled to send one in-patient at a time, and out-patients without limitation. Subscribers of smaller sums may likewise send what number of out-patients they please. All subscriptions are during pleasure, and any small sums from well-disposed persons will be thankfully received; but in order to carry on this undertaking, all persons are desired to pay their subscription at the time of subscribing.

The poor objects recommended as in-patients, if there are beds empty, are received at any hour without difficulty or expence, and are supplied with advice, medicine, diet, washing, lodging, and every comfortable assistance during their cure; nor is any security required against future contingencies, they being, in case of death, buried at the expence of the charity, if not removed by their friends. All out-patients have advice and medicines administered from eleven till one.

All accidents, whether recommended or not, are received at any hour of the day or night.

This is the plan of this noble charity; and though this work has subsisted but eighteen years, yet such has been the extraordinary encouragement given to it, that since the third of November 1740, to the first of January

ary 1759, the sums generously contributed to its support amount to seventy-nine thousand one hundred and fifty-three pounds, a great part of which is laid out in government securities. But what is still more extraordinary, one hundred and thirty-seven thousand two hundred and fifty-two distressed objects have been relieved at this hospital; and from labouring under the oppression of some of the most malignant diseases and unhappy accidents, have been reinstated in their honest and industrious capacities of working; and, so far as our observation reaches, their morals much amended, whereby the public again enjoy the benefit of their labour, and they, and their poor families, are preserved from perishing, and prevented from being an incumbrance to the community. And, notwithstanding the great number of objects relieved by this charity, it has not lessened the number of patients relieved by other hospitals.

The subscribers are desired to take notice, that if any patients do not conform to the rules of the house, or are guilty of any misbehaviour, they will be discharged, and never more relieved by this charity: and not to send any patient unable to walk, till they are first assured of room in the house; and when they recommend an in-patient, whose settlement is in the country, it is further requested, that they will satisfy the house committee concerning the removal of such patient, when cured, or judged incurable.

“ No persons of known ability to pay for their cure, are allowed to partake of this charity; nor any with infectious distempers, or deemed incurable by the physicians and surgeons, or any in consumptive or asthmatic condition, are admitted into the house, being more capable of relief as out-patients.”

The patients, being admitted without any expence, are required to be constant in their attendance on the physicians or surgeons at the hospital, before eleven o'clock; and, at nine o'clock, to return thanks at the chapel, and at the weekly committee next after their cure; and those only who attend their cure, and return thanks, will receive a certificate thereof, which will entitle them to future relief.

The building in Precot-street, Goodman's-fields, which was formerly the London Infirmary, is now applied to the reception of penitent prostitutes, and is called the Magdalen-house. It is a plain neat structure, with a wall, and a small area before it. To prevent these penitents from being exposed to public view, the windows next the street are concealed by wood-work, sloping up from the bottom of each, so as to admit the light only at the top: the sides are also inclosed. This excellent charity commenced in the year 1758.

In a street called Rosemary Lane, in this parish, is a daily fair, commonly known by the name of Rag Fair; and here is a large building, called the Exchange, where great sums of money are returned in old cloaths.

In the parish of St. Mary are two free schools, two alms-houses, a court of record, a prison, and a work-house for the poor.

Near the Tower of London is a church dedicated to St. Catharine, which anciently belonged to an hospital founded by Matilda, consort to king Stephen. This church, which is a very antique building, is still collegiate, and has a master and three brethren, who have forty pounds; three sisters, who have twenty pounds; and ten beads-women, who have eight pounds *per annum* each.

The parish of St. Catharine still remains a distinct liberty, having its proper steward or judge; and a court within the precinct for the trial of civil causes, with a prison for debtors; nor can any person be arrested here without an order from the board of green cloth.

St. John's parish in Wapping was taken out of St. Mary's, Whitechapel, in the reign of king William III. and is almost entirely inhabited by mariners, or such as depend upon them. In consideration of the numerous poor in this parish, and its having been a third part of the parish of St. Mary Whitechapel, it is entitled to one third of all the gifts and legacies given to the mother parish. Here are two charity-schools, a work-house for the poor, a yard for ship-building, and two docks, one of which is for the execution of pirates.

In St. Paul's parish, Shadwell, there are two churches, a presbyterian charity-school, a work-house for the poor, an alms-house, and a dock for building ships.

St. George's church in the East is one of the fifty new churches erected according to act of parliament. It was begun in 1715, and finished in 1729, and is a massy building, in a very singular taste. In this parish there is an hospital, two charity-schools, a work-house for the poor, and an alms-house.

St. Anne's church, Limehouse, is another of the fifty new churches. It was begun in 1712, and finished in 1724; and is a building of a very singular construction. In this parish there are a work-house for the poor, and two docks for ship-building; and this, as well as the two parishes immediately preceding, are chiefly inhabited by seafaring people, or such as depend on them.

St. Dunstan's church in Stepney is an old Gothic structure. Here was a church so long ago as the time of the Saxons; and Stepney appears to have been a manor in the time of William the Conqueror. This is a very large parish, containing several hamlets, each of which has a chapel of ease, belonging to Stepney church.

On the south side of the church-yard is an alms-house, founded in 1691 by the relief of Sir Samuel Mico, a citizen and mercer, for ten poor widows of the mercers company, who have each eight pounds thirteen shillings and four-pence a year.

At Mile-end, in the parish of St. Matthew Bednal or Bethnal-green, is an hospital belonging to the corporation of Trinity-house. This hospital was founded in 1695, for twenty-eight decayed or ancient seamen, who have been masters or pilots of ships, and for their widows, each of whom receives sixteen shillings the first Monday in every month, besides twenty shillings a year for coals, and a gown every other year. This is a noble edifice, built of brick and stone, consisting of two wings, and containing twenty-eight apartments. In the centre, between the two wings, is a chapel, which rises considerably higher than the other buildings.

In 1735, the drapers company erected here a beautiful alms-house, a school and chapel, pursuant to the will of Mr. Francis Bancroft, one of the lord mayor's officers, who bequeathed to that company upwards of twenty-eight thousand pounds, for purchasing a site, and building upon it an alms-house, with convenient apartments for twenty-four alms-men, a chapel, and a school-room for one hundred poor boys, and two dwelling-houses for two school-masters, and also for endowing the same; so that each alms-man should have eight pounds, and half a chaldron of coals yearly, and a gown of baize every third year; that the school-boys should be clothed, and taught reading, writing, and arithmetic; that each of the masters should have a salary of thirty pounds a year; and that both should have the yearly sum of twenty pounds for coals and candles, for their own use, and that of the school; together with a sufficient allowance for books, paper, pens and ink: every boy put out apprentice is entitled to four pounds, but only two pounds ten shillings if put out to service.

Here are also eight alms-houses belonging to the drapers company, twelve belonging to the skinners company, twelve to the vintners company, and twelve alms-houses known by the name of Fuller's alms-houses, from their having been founded, in 1592, by a judge of that name. In Dog-row, near Mile-end, is an alms-house, built, in 1711, by captain Fisher, for the widows of six masters of ships.

At Bethnal-green is an alms-house, founded by Mr. Bermeeter, for six poor women.

London was walled round very early; but by whom these walls were built, is uncertain: some think by Constantine the Great, others by his mother Helena; but there is great reason to believe it was by the emperor Valentinian I. about the year of Christ 368. It is believed that these walls quite surrounded the city, as well upon the side of the Thames, as upon the land side; but that part of the wall next the river has been destroyed by the tide so long ago, that there are now no traces even of its ruins.

The

The extent of the walls, or the circumference of the ancient city within them, is three miles, one hundred and sixty-five feet. These walls were composed of layers of flat Roman brick, and rag-stones alternately. From the remains of the Roman work still to be seen in the city walls, it is conjectured that their original height was twenty-two feet: they were fortified with several lofty towers, the number of which, upon the land side, was fifteen. The remains of two of these towers are still to be seen; one in a street called Shoemaker-row, near Aldgate, and the other on the west side of a neighbouring street, called Houndsditch.

The remains of these two towers are thought to be the most considerable pieces of Roman architecture now in Britain: one of them still consists of three stories, and is twenty-six feet high, though greatly decayed, and split in some parts from top to bottom: the other is twenty-one feet high, perfectly sound, and very beautiful, the bricks being as good as if newly laid, though the stones are in some parts crumbled away. In a street called the Vineyard, not far from these towers, is the basis of another Roman tower, about eight feet high, supporting a new building of three stories high. From the remains of these towers, it is conjectured, that their height was about forty feet.

In the reign of king Henry II. the walls of this city were considerably raised. In the reign of Richard I. great part of them was demolished, to make room for the ditch round the Tower of London; and being much decayed in the reign of king Henry III. he obliged the citizens to repair them at a very great expence.

In the reign of king John, the city of London was fortified, by drawing a deep moat or ditch two hundred feet wide, round the walls. This ditch was cleaned in the reign of king Richard II. And it appears, that the crown usually granted the magistrates of London a duty on certain goods, to defray the expence of cleaning the ditch, and repairing the walls.

In the reign of Edward V. great part of the city walls were rebuilt at the charge of the city companies. In the reign of Henry VIII. the ditch was cleaned; and in the reign of queen Elizabeth, it was twice cleaned, and part of it widened. But all this ditch has for many years been filled up, and covered with buildings; and so much, both of the walls and ditch, has been appropriated by the city to public uses, that there are few parts in which either of them can be seen to advantage.

Some remains of the walls still subsist between the houses on the east side of Poor Jewry-lane, and the Minories, and along Houndsditch, from the place where a gate called Aldgate lately stood, to that in which another gate called Bishopsgate stood. From the site of Bishopsgate, the ruins of the walls may be traced to the place in which a gate called Little Moorgate stood; from the site of Little Moorgate to Aldermanbury, and from thence, behind the houses, to the place where stood a gate called Cripplegate: from hence the walls extend on to the back of St. Giles's church, and run along the back of the houses in Crowder's Well Alley, and are visible almost to the place where Aldersgate lately stood; from the site of Aldersgate they run along the back of the houses in Bull and Mouth street; but from this street there is scarce any part of them visible to Newgate; from Newgate they are in some places of a considerable height, extending in a pretty regular line on the back of the houses in the Old Bailey, almost to the place where Ludgate stood.

The original gates of this city, or those erected at the same time with the walls, are supposed to be four, Newgate, Cripplegate, Aldgate, and Dowgate; but Dowgate has been demolished so long, that even the site of it is not exactly known. These four original gates were erected over the three great Roman military ways, in this part of Britain. The Roman way, called Watling Street, which would have intersected the Thames from Surry, entered London through Dowgate, and crossing the city, passed through Newgate. The military way called Ermine-street is supposed to have pointed to Cripplegate, and the Vicinal way to have run through Aldgate.

In the reign of king Henry II. the walls had seven gates, which were Aldgate, Bishopsgate, Cripplegate, Aldersgate, Newgate, Ludgate, and a postern near the Tower; but that part of the wall next the Tower being demolished in the reign of king Richard I. the postern having lost its old support, fell down, and was afterwards supplied by a mean wooden building, which went also to decay many years ago. As for those places called Botolphsgate, Billingsgate, and the Watergates, near the Tower and Custom-house, it does not appear that they ever were real-gates, but wharfs only.

All these seven gates stood till very lately, when an act of parliament having passed for widening and improving the streets of this city, they were considered as so many incumbrances, and all taken down, in the years 1760 and 1761, except Newgate, which is still standing.

Aldgate is a name supposed by some to have been derived from the antiquity of this gate, which was certainly one of the original gates of the city, and is mentioned in a charter of king Edgar, as far back as the year 967. It stood on the east side of the city, but being ruinous, was rebuilt in 1609. On the top of the gate was a vane, supported by a gilt sphere, on each side of which, upon the top of the upper battlements, in the east front, stood the statue of a soldier, holding a bullet in his hand. Beneath these, in a large square niche, was a statue of king James I. in gilt armour, with a lion and unicorn couchant at his feet. On the west front was a statue of Fortune, gilt, standing on a globe, with a spreading sail over her head. A little lower, on the south side, was a figure of Peace, with a dove on one hand, and a gilt wreath on the other; and over against that, on the north side, was a figure of Charity, with a child at her breast, and another in her hand.

Bishopsgate, on the north side of the city, is supposed to have been so called from the figures of two bishops, one on the north, and another on the south front. When it was first built, is uncertain; but it was kept in repair by the company of merchants of the Hanse-towns, residing in this city, in consideration of certain privileges granted them. This company rebuilt it in 1479, and it was erected, for the last time, in 1735.

Aldersgate, the most ancient north gate of this city, was rebuilt in 1617. On the north front of it was a statue of king James I. on horseback; with two other figures, one of the prophet Jeremiah on one side, and the other of the prophet Samuel on the other side. Over the king's head were the arms of England, Scotland, and Ireland. On the south front of the gate was a figure of the same king James I. sitting in his robes, on a throne. This gate, being damaged by the fire of London, was repaired in 1670.

Newgate stands in the north-west corner of the city, and is said to have been the common jail for felons taken in the city of London, or the county of Middlesex, ever since the year 1218; and so lately as the year 1457, Newgate, and not the Tower, was a prison for the nobility and great officers of state. Newgate having been much damaged by the fire of London, the present structure was erected; the west side of which is adorned with three ranges of pilasters of the Tuscan order, with their entablatures; and in the intercolumniations are four niches, with as many figures as big as the life, and well executed. The east front of the gate is adorned with a range of pilasters, with entablatures; and in three niches are the figures of Mercy, Justice and Truth.

Ludgate was the west gate of this city, and was rebuilt in 1586; it was however ruined by the fire of London, but repaired and beautified in 1699. The east side of it was adorned with four pilasters of the Doric order, with their entablatures; and in the intercolumniations were placed the figures of a pretended British king, called Lud, and his two sons, Androgeus and Theomantius, in their British habits. These figures were first set up in the year 1260, when it was believed that the fictitious king Lud had first built this gate, whence it was called Ludgate. The west side was adorned with two pilasters of the Ionic order, with their entablatures; also two columns, and a pediment, adorning a niche, in which was placed

placed a good statue of queen Elizabeth in her robes : and over it was the queen's arms, between the city supporters. This gate had been part of a prison for such debtors as were freemen of the city, ever since the year 1378, till 1760, when the prison was demolished, together with the gate. The prison was known by the name of Ludgate prison.

Moorgate, which stood between Bishopsgate and Cripplegate, was first built in 1415, upon the side of a moor, from which it was so called, and over which causeways were raised from hence, for the passage of the citizens into the fields. It was rebuilt after the fire of London in 1666, with a magnificent gateway, the arch of which was near twenty feet high.

Cripplegate stood between Moorgate and Aldersgate, and is supposed to have been thus called from having been anciently a place where lame and infirm persons used to beg. It was a very plain solid structure, without any ornament.

In digging the foundation of Aldgate, when it was rebuilt in 1609, several Roman coins were found; and under the foundation of the city walls, in many places, a great number of Roman coins and medals have been dug up, among which some were of Helena, the mother of the emperor Constantine the Great; a circumstance that strongly favours the opinion of the walls having first been erected by her, or by her son Constantine, at her request.

In clearing the foundations of St. Paul's cathedral, after the fire of London, it was found to have been anciently a great burying-place; for under the graves of modern times were discovered the graves of the Saxons, who cased their common dead in chalk stones, and buried persons of eminence in stone coffins: below these were the graves of the ancient Britons, as appeared by a great number of ivory and wooden pins found among the dust: for it was customary with the ancient Britons to pin the corpse in woollen shrouds, and lay it, without any other covering, in the ground. At a still greater depth was discovered a great number of Roman urns, dishes, and other vessels, found, and of a beautiful red, like sealing-wax: on the bottom of some of these vessels were inscriptions, by which they appeared to have been drinking vessels: some of them were beautifully embellished on the outside with raised work of various figures; some were inscribed with the names of deities, heroes, and judges; and the matter of which they were made vied in beauty with polished metal. Here were also discovered several Roman coins, and a number of tessellæ, of various sorts of marble, in the form of dice, which were used by the Romans in paving the prætorium, or general's tent; whence some have thought, that this was the site of the Roman prætorium in London.

In 1669, was dug up near Ludgate, a sepulchral stone, engraved with the figure of a Roman soldier, and an inscription in remembrance of Vivius Marcianus, a soldier of the second legion, styled Augusta, to whose memory this monument was erected by his wife Januaria Matrina.

In digging the canal of Fleet-ditch, between Fleet-prison and Holborn-bridge, several Roman utensils were discovered, together with a vast number of Roman coins, in silver, copper, and brass. At Holborn-bridge were dug up two brazen figures of Roman deities, one of Bacchus, and the other of Ceres, and each about four inches long. Here were also found several antiquities of later times, as arrow-heads, scales, seals engraved with Saxon characters, spur-rowels, keys and daggers, together with a considerable number of medals, and other matters.

But one of the most remarkable pieces of antiquity in this famous city, is London Stone, which has been carefully preserved from age to age, and is mentioned by the same name so early as in the time of Ethelstan, king of the West Saxons.

This stone, which stands close under the south wall of St. Swithin's church, was formerly a little nearer the channel facing the same place, and being fixed very deep in the ground, was so strongly fastened by bars of iron, as to be in no danger from the carriages.

It seems very surprizing that so great a piece of antiquity has been constantly preserved with such care; and yet so little has been said of it, that the original cause of its erection, and the use for which it was intended, are entirely unknown. A very ingenious author observes, that as London appears to have been a Roman city, it will be no improbable conjecture, that this stone was the centre, from whence they extended its dimensions; and might serve as the standard at which they began to compute their miles. Of this opinion was also Mr. Maitland, and the great Sir Christopher Wren, who grounded his conjecture upon proofs which are not every day to be obtained; for by rebuilding many of the churches after the fire of London, he had an opportunity of discovering and tracing the ancient boundaries of London, with a greater nicety than is ever to be expected again. On clearing the foundations of St. Mary le Bow in Cheapside, he found, upon opening the ground, the walls, with the windows and pavement of a Roman temple, entirely buried under the level of the present street. This temple stood about forty feet backwards; but having occasion to bring the steeple of the new church to range with the high street, he again began to dig through the made ground, till having proceeded eighteen feet deep, to his surprize he discovered a Roman causeway of rough stone, four feet thick, close and well rammed, with Roman brick and rubbish at the bottom, all firmly cemented: he was therefore of opinion, that this was the northern boundary of the Roman colony, and that the breadth from north to south was from this causeway, now Cheapside, to the Thames; the extent east and west from Tower-hill to Ludgate. The principal or Prætorian Way, he supposed to be Watling-street; whence London Stone appears to have been nearly in the centre of the ancient city, before it was destroyed by Boadicea, and when it was not encompassed with walls.

About two miles west of London, is Kensington, a large and populous village, remarkable for a royal palace, which, in the late reign, was generally the summer residence of the court.

The palace, which was the seat of the lord chancellor Finch, afterwards earl of Nottingham, was purchased by king William, who greatly improved it, and caused a royal road to be made to it through St. James's and Hyde-parks, with lamp-posts erected at equal distances on each side. Queen Mary enlarged the gardens; her sister, queen Anne, improved what Mary had begun; and was so pleased with the place, that she frequently supped during the summer in the Green-house, which is a very beautiful one: but her late excellent majesty, queen Caroline, completed the design, by extending the gardens from the great road leading to Acton; by bringing what is called the Serpentine river into them, and by taking in some acres out of Hyde-park, on which she caused a mount to be raised, with a chair upon it, that could be easily turned round, so as to afford shelter from the wind. This mount is surrounded with a grove of ever-greens, and commands a fine view over the gardens to the south and west. In short, these gardens, which are three miles and a half in compass, are kept in great order, and in summer-time, when the court is not there, are resorted to by great numbers of people. The palace, indeed, has none of that grandeur which ought to appear in the residence of a British monarch: its nearness to the town makes it very convenient, but it is very irregular in point of architecture. However, the royal apartments are grand, and some of the pictures are good.

On passing the base court, you enter through a large portico into a stone gallery, that leads to the great staircase, which is a very fine one, and consists of several flights of black marble steps, adorned with iron balusters finely wrought. The painting here affords the view of several balconies with groups of figures representing yeomen of the guard, and spectators, among whom are drawn Mr. Ulrick, commonly called the young Turk, in the Polonese dress in which he waited on his late majesty king George I. Peter, the wild youth, &c. The stair-case is richly decorated and painted by Mr. Kent.

The first room is hung with very fine tapestry, representing the goddess Diana hunting, and killing the wild boar. Over the chimney is a picture in a grand taste, representing one of the Graces in the character of Painting, receiving instructions from Cupid. This piece is said to be done by Guido Reni. In one corner of the room is a marble statue of Venus, with an apple in her hand; and in another is the statue of Bacchus, whose head is finely executed; but the body, which is inferior to it, seems to be done by another hand.

The second room has its ceiling painted with Minerva, surrounded by the arts and sciences, by Mr. Kent. Over the chimney is a very fine piece representing Cupid admiring Psyche, while she is asleep, by Vandyke. On each side of the room are hung several pictures, as king Henry VIII. and the comptroller of his household, by Holbein: a three quarter picture of king Charles I. and another of his queen, by Vandyke: the duke and dutchess of York, by Sir Peter Lely: as also king William and queen Mary, when prince and princess of Orange, over the doors, by the same hand.

The third room, which was the late queen's apartment, is adorned with very beautiful tapestry, representing a Dutch winter-piece, and the various diversions peculiar to the natives of Holland, done by Mr. Vanderbank. Over the chimney is an admirable picture of king Charles II. king James II. and their sister the princess of Orange, when children, by Vandyke.

In the fourth room is the picture of a battle or skirmish between the Germans and Italians, by Holbein. Another of Danae descending in a shower of gold; and another of the widow Elot, finely executed by our countryman Riley.

In the fifth room is a picture of the crucifixion, and another of our Saviour laid on the cross, both by Titian: of our Saviour calling St. Matthew from the receipt of customs, by Annibal Caracci; and of his healing the sick in the temple, by Verrio: a picture of Henry IV. of France, by Titian: two heads of queen Mary I. and queen Elizabeth, when children, by Holbein: the late queen Anne, when an infant, by Sir Peter Lely: and several heads by Raphael.

In the sixth room, or rather gallery, are the pictures of king Henry VIII. and queen Katharine of Arragon, both by Holbein: king Philip of Spain, and queen Mary, by the same hand: king James I. by Vandyke: king Charles II. the face by Sir Peter Lely: queen Elizabeth in a Chinese dress, drawn when she was a prisoner at Woodstock: king James II. when duke of York, and another of his queen, both by Sir Peter Lely: king William and queen Mary in their coronation robes, by Sir Godfrey Kneller. Sir Godfrey was knighted on his painting these pictures; king William being doubtless pleased with so fine a picture of his queen. The next is queen Anne, after Sir Godfrey Kneller; and a picture of queen Caroline, which is but poorly executed. In this room is a curious amber cabinet, in a glass case; and at the upper end a beautiful orrery, likewise in a glass case.

The seventh, which is called the Cupola room, has a star in the centre, and the ceiling all around is adorned with paintings in mosaic. Round the room are placed, at proper distances, eight busts of ancient poets, and six statues of the Heathen gods and goddesses at full length, gilt. Over the chimney-piece is a curious bas relief in marble, representing a Roman marriage, with a bust of Cleopatra, by Mr. Ryfbrack.

In the king's great drawing-room, over the chimney, is a very fine picture of St. Francis adoring the infant Jesus, held in the lap of the Virgin Mary, Joseph attending, the whole performed by Sir Peter Paul Rubens. In this room are also the holy family, finely painted by Paul Veronese: three priests, by Tintoret: a noble picture of St. Agnes over one of the doors, by Domenichino: St. John Baptist's head, Mary Magdalen, and a naked Venus, all by Titian: a Venus in a supine posture, stealing an arrow out of Cupid's quiver, with beautiful ornaments, in the high gusto of the Greek antique, representing Love and the Drama, by Jacobo da Pontormo: upon the original out-lines of the great Michel

Angelo Buonaroti: a picture of Villars, duke of Buckingham, and his younger brother, when boys, one of the capital pieces of Vandyke: two large pictures by Guido Reni, one of Venus dressing by the Graces; the other of Andromeda chained to a rock: our Saviour in the manger, by Bassan; and a picture of part of the holy family, by Palma the elder.

The ceiling of this room, in which there is such a mixture of sacred and prophane pieces, is painted with the story of Jupiter and Semele.

In the state chamber, the bed is of crimson damask; and over the chimney is a picture of our Saviour and St. John Baptist, by Raphael.

In the state dressing-room the hangings are all of needle-work, a present from the queen of Prussia. Here is a picture of Edward VI. by Holbein; of a young nobleman of Venice, by Tintoret; another young nobleman of the same place, by Tintoret; and Titian's lady, painted by himself.

The Painted Gallery is adorned with many admirable pieces. At one end is king Charles I. on a white horse, with the duke d'Espemon holding his helmet; the king is an august and noble figure, with some dejection in his countenance: the triumphal arch, curtain, and other parts of the back ground, are finely executed, and so kept, that the king is the principal figure that strikes the eye: at a little distance it has more of the life than a picture, and one is almost ready to get out of the horse's way, and bow to the king.

Fronting this picture, at the other end of the gallery, is the same king, with his queen, and two children; king Charles II. when a child, and king James II. an infant in the queen's lap. The king's paternal tenderness is finely expressed, his son standing at his knee: the queen's countenance is expressive of an affectionate obedience to his majesty, and a fond care of her child, which she seems to desire the king to look on. The infant is exquisitely performed; the vacancy of thought in the face, and the inactivity of the hands, are equal to life itself at that age. These two admirable pieces were done by Vandyke.

One of the next capital pictures in this gallery is Esther fainting before king Ahasuerus, painted by Tintoret. All the figures are finely drawn and richly dressed in the Venetian manner; for the Venetian school painted all their historical figures in their own habits, thinking them more noble and picturesque than any other.

The next piece is the nine muses in concert, finely drawn by the same master.

Midas preferring Pan to Apollo, is a fine piece, by Andrea Schiavone; but it is a good deal hurt by time: the figures, however, are well drawn and coloured; and the affectation of judgment in Midas is finely expressed.

The shepherds offering gifts to Christ, St. John in prison, the story of the woman of Samaria, and John Baptist's head, are fine pieces, by Old Palma.

Noah's flood, by Bassan, is a masterly performance.

Over the chimney is a Madona, by Raphael, which, though a small piece, gives a very high idea of that great master's abilities. There is also in this gallery a Madona by Vandyke, which is exquisitely performed.

The other pictures here are, the birth of Jupiter, a fine piece, by Giulio Romano; a Cupid whetting his arrow, by Annibal Caracci; and a Venus and Cupid, by Titian.

At Chelsea, a very large and populous village situated on the banks of the Thames, about a mile to the westward of St. James's Park, there is an edifice for the reception of old soldiers and invalids in the land service, called Chelsea Hospital, the Royal Hospital, and sometimes Chelsea College.

The original building on this spot was a college founded by Dr. Sutcliff, dean of Exeter, in the reign of king James I. for the study of Polemic divinity, and was endowed in order to support a provost and fellows, for the instruction of youth in that branch of learning. The king, who laid the first stone, gave many of the materials, and promoted the work by a large sum of money, and the clergy were very liberal upon the same occasion; but the sum settled upon the foundation by Dr. Sutcliff

Butkiff being far unequal to the end proposed, the rest was left to private contributions; and these coming in slowly, the work was stopped before it was finished, and therefore soon fell to ruin. At length the ground on which the old college was erected, becoming escheated to the crown, Charles II. began to erect the present hospital, which was carried on by James II. and completed by William and Mary.

The whole edifice, which was built by the great Sir Christopher Wren, consists of a vast range of buildings. The front toward the north opens into a piece of ground laid out in walks for the pensioners; and that facing the south, into a garden which extends to the Thames, and is kept in good order. This side affords not only a view of that fine river, but of the county of Surry beyond it. In the centre of this edifice is a pediment supported by four columns, over which is a handsome turret, and through this part is an opening which leads through the building. On one side of this entrance is the chapel, the furniture and plate of which was given by king James I. and on the other side is the hall, where all the pensioners dine in common, the officers by themselves. In this hall is the picture of king Charles II. on horseback, with several other pieces as big as the life, designed by Signior Vario, and finished by Mr. Cook. These were presented by the earl of Ranelagh. The pavement of both the chapel and hall are black and white marble. The altar-piece in the chapel is the resurrection, painted by Sebastian Ricci.

The wings, which extend east and west, join the chapel and hall to the north, and are open towards the Thames, on the south: these are near three hundred and sixty feet in length, and about eighty in breadth; they are three stories high, and the rooms are so well disposed, and the air so happily thrown in by means of the open spaces, that nothing can be more pleasant. On the front of this square is a colonade extending along the side of the hall and chapel, over which, upon the cornice, is the following inscription in capitals:

In subsidium et levamen emeritorum senio, belloque fractorum, condidit CAROLUS II. Auxit JACOBUS II. Perfecere GULIELMUS et MARIA, Rex et Regina, MDCXC.

And in the midst of the quadrangle is the statue of king Charles II. in the ancient Roman dress, somewhat bigger than the life, standing upon a marble pedestal. This was given by Mr. Tobias Rustat, and is said to have cost five hundred pounds.

There are several other buildings adjoining, that form two other large squares, and consist of apartments for the officers and servants of the house; for old maimed officers of horse and foot, and the infirmary for the sick.

An air of neatness and elegance is observable in all these buildings. They are composed of brick and stone, and which way soever they are viewed, there appears such a disposition of the parts as is best suited to the purposes of the charity, the reception of a great number, and the providing them with every thing that can contribute to the convenience and pleasure of the pensioners.

Chelsea Hospital is more particularly remarkable for its great regularity and proper subordination of parts, which is very apparent in the north front. The middle is very principal, and the transition from thence to the extremities, is very easy and delightful.

The expence of erecting these buildings is computed to amount to one hundred and fifty thousand pounds, and the extent of the ground is above forty acres.

In the wings are sixteen wards, in which are accommodations for above four hundred men, and there are besides in the other buildings, a considerable number of apartments for officers and servants.

These pensioners consist of superannuated veterans, who have been at least twenty years in the army; or those soldiers who are disabled in the service of the crown. They wear red coats lined with blue, and are provided with all other cloaths, diet, washing and lodging. The governor has five hundred pounds a year; the lieutenant governor two hundred and fifty pounds; and the major one hundred and fifty pounds. Thirty-six officers are allowed six-pence a day; thirty-four light horsemen,

and thirty serjeants, have two shillings a week each; forty-eight corporals and drums have ten-pence per week; and three hundred and thirty-six private men, are each allowed eight-pence a week. As the house is called a garrison, all the members are obliged to do duty in their respective turns; and they have prayers twice a day in the chapel, performed by two chaplains, who have each a salary of one hundred pounds a year. The physician, secretary, comptroller, deputy treasurer, steward, and surgeon, have also each one hundred pounds *per annum*, and many other officers have considerable salaries. As to the out-pensioners, who amount to between eight and nine thousand, they have each seven pounds twelve shillings and six-pence a year.

These great expences are supported by a poundage deducted out of the pay of the army, with one day's pay once a year from each officer and common soldier; and when there is any deficiency, it is supplied by a sum raised by parliament. This hospital is governed by the following commissioners; the president of the council, the first commissioner of the treasury, the principal secretary of state, the paymaster general of the forces, the secretary at war, the comptrollers of the army, and by the governor and lieutenant governor of the hospital.

Besides this hospital, there is at Chelsea a physic-garden belonging to the apothecaries company. It contains almost four acres, and is enriched with a vast variety of plants, both domestic and exotic. This garden was given to the apothecaries company by Sir Hans Sloane, Bart. on condition of their paying a quit-rent of five pounds a year, and delivering annually to the president and fellows of the Royal Society, at one of their public meetings, fifty specimens of different sorts of plants, well cured, and of the growth of this garden, till the number of specimens amounts to two thousand.

In this village is also a celebrated place of public resort, called Ranelagh Gardens, from their formerly belonging to the earl of Ranelagh. This is one of those public places of pleasure which is not to be equalled in Europe, and is the resort of people of the first quality. Though its gardens are beautiful, it is more to be admired for the amphitheatre. This is a circular building, the external diameter is one hundred and eighty-five feet: round the whole is an arcade, and over that a gallery with a balustrade (to admit the company into the upper boxes) except where the entrances break the continuity. Over this are the windows, and it terminates with the roof. The internal diameter is one hundred and fifty feet, and the architecture of the inside corresponds with the outside, except that over every column, between the windows, termini support the roof. In the middle of the area, where the orchestra was at first designed, is a chimney having four faces. This makes it warm and comfortable in bad weather. The orchestra fills up the place of one of the entrances. The entertainment consists of a fine band of music, with an organ, accompanied by the best voices. The regale is tea and coffee.

About twelve miles west of London, is the royal palace of Hampton Court, delightfully situated on the north bank of the river Thames, at a small distance from a village called Hampton. This palace was magnificently built with brick by Cardinal Wolsey, who here set up two hundred and eighty silk beds for strangers only, and richly stored it with gold and silver plate; but it raised so much envy against him, that to screen himself from its effects, he gave it to king Henry VIII. who, in return, suffered him to live in his palace of Richmond. King Henry greatly enlarged it, and it had then five spacious courts adorned with buildings, which in that age were greatly admired by all foreigners, as well as the natives.

In order to give a more perfect idea of this grandeur, we shall give a description of the ornaments of this palace, as they appeared in the reign of queen Elizabeth, from an author who describes what he himself saw.

“The chief area, says he, is paved with square stone; in its centre is a fountain that throws up water, covered with a gilt crown, on the top of which is a statue of Justice, supported by columns of black and

“ and white marble. The chapel of this palace is most
 “ splendid, in which the queen’s closet is quite transpa-
 “ rent, having its windows of crystal. We were led
 “ into two chambers called the presence, or chambers
 “ of audience, which shone with tapestry of gold and
 “ silver, and silk of different colours: under the ca-
 “ nopy of state are these words embroidered in pearl,
 “ VIVAT HENRICUS OCTAVUS. Here is, besides, a
 “ small chapel, richly hung with tapestry, where the
 “ queen performs her devotions. In her bedchamber
 “ the bed was covered with very costly coverlids of silk.
 “ At no great distance from this room we were shewn a
 “ bed, the tester of which was worked by Anne Boleyn,
 “ and presented by her to her husband, Henry VIII.
 “ All the other rooms, being very numerous, are ad-
 “ orned with tapestry of gold, silver, and velvet, in
 “ some of which were woven history pieces, in others
 “ Turkish and American dresses, all extremely natural.
 “ In the hall are these curiosities: a very clear look-
 “ ing-glass, ornamented with columns and little images
 “ of alabaster; a portrait of Edward VI. brother to
 “ queen Elizabeth; the true portrait of Lucretia; a
 “ picture of the battle of Pavia; the history of Christ’s
 “ passion, carved in mother of pearl; the portrait of
 “ Mary Queen of Scots; the picture of Ferdinand
 “ prince of Spain, and of Philip his son; that of
 “ Henry VIII. under which was placed the Bible, cu-
 “ riously written upon parchment; an artificial sphere;
 “ several musical instruments. In the tapestry are re-
 “ presented negroes riding upon elephants; the bed in
 “ which Edward VI. is said to have been born, and
 “ where his mother Jane Seymour died in child-bed.
 “ In one chamber were several excessively rich tapestries,
 “ which are hung up when the queen gives audience to
 “ foreign ambassadors; there were numbers of cushions
 “ ornamented with gold and silver; many counterpanes
 “ and coverlids of beds lined with ermine. In short,
 “ all the walls of the palace shine with gold and silver.
 “ Here is, besides, a certain cabinet, called Paradise,
 “ where, besides that every thing glitters so with silver,
 “ gold, and jewels, as to dazzle one’s eyes, there is a
 “ musical instrument made all of glass, except the
 “ strings. Afterwards we were led into the gardens,
 “ which are most pleasant.”

This palace, which was afterwards the prison of king Charles I. is, with the parks, encompassed in a semicircle by the Thames. King William and queen Mary were so greatly pleased with its situation, which rendered it capable of great improvements, and of being made one of the noblest palaces in Europe, that while the former was causing the old apartments to be pulled down, and rebuilt in the more beautiful manner in which they now appear, her majesty, impatient to enjoy so agreeable a retreat, fixed upon a building near the river, called the Water Gallery, and suiting it to her convenience, adorned it with the utmost elegance, though its situation would not allow it to stand after the principal building was completed.

Since the pulling down of the Water Gallery, which stood before the fine stone front that faces the river, the ground to the south-west received considerable improvements. This spot is laid out in small inclosures, surrounded with tall hedges, in order to break the violence of the winds, and render them proper for the reception of such exotic plants as were moved thither in summer out of the conservatories. Here are two basons constantly supplied with water, for the support of these plants in dry weather; and as these are situated near the great apartments, most of the plants may be viewed from the window.

At a small distance to the west, stood a large hot-house, for preserving such tender exotic plants as require a greater share of warmth than is generally felt in this climate. Of this part of gardening queen Mary was so fond, that she allowed a handsome salary to Dr. Plukenet, a very learned botanist, for overlooking and registering the curious collection of plants she caused to be brought into the garden; but since her majesty’s death, they have been much neglected, and very few of the most curious plants are now to be found there.

The park and gardens, with the ground on which the palace now stands, are about three miles in circumference. On a pediment at the front of the palace on this side, is a bas-relief of the triumphs of Hercules over Envy; and facing it a large oval bason, answering to the form of this part of the garden, which is a large oval divided into gravel walks and parterres, laid out in an elegant manner, by those two eminent gardeners, London and Wise.

At the entrance of the grand walk, are two large marble vases, of exquisite workmanship; one said to be performed by Mr. Cibber, the father of the poet laureate: and the other by a foreigner: these pieces are reported to be done as a trial of skill; but it is difficult to determine which is the finest performance. They are beautifully adorned with bas-relief; that on the right hand representing the triumphs of Bacchus; and the other on the left, Amphitrite and the Nereides. At the bottom of this walk, facing a large canal which runs into the park, are two other large vases, the bas-relief on one representing the judgement of Paris; and that of the other, Meleager hunting the wild boar.

In four of the parterres are four fine brass statues. The first is a gladiator, which formerly stood in the parade of St. James’s Park, at the foot of the canal, and was removed thither in the reign of queen Anne. The original was performed by Agasias Desitheus of Ephesus, and is in the Borghesian palace at Rome. The second is a young Apollo; the third a Diana; and the fourth, Saturn going to devour one of his children: all after fine originals.

On the south side of the palace is the privy garden, which was sunk ten feet, to open a view from the apartments to the river Thames. In this garden is a fine fountain, and two grand terrace walks.

On the north side of the palace is a tennis-court; and beyond that a gate which leads into the wilderness. Farther on is the great gate of the gardens, on the sides of which are large stone piers, with the lion and unicorn couchant, in stone.

We shall now leave the gardens, to take a view of the palace, and several apartments, with their noble furniture and fine paintings, performed by the most eminent masters.

To begin with the first entrance into the palace, at the gates of which are four large brick piers, adorned with the lion and unicorn, each of them holding a shield, whereon are the arms of Great Britain, with several trophies of war well carved on stone.

Passing through a long court-yard, on each side of which are stabling for the officers of his majesty’s household, we come next to the first portal, which is strongly built of brick, and decorated by Wolfey with the heads of four of the Cæsars, Trajan and Adrian on one side, and on the other Tiberius and Vitellius.

Through this portal we pass into a large quadrangle, remarkable for nothing extraordinary, but its spaciousness and uniformity. This leads to a second quadrangle, where, over the portal, is a beautiful astronomical clock, made by the celebrated Tompion, on which are curiously represented the twelve signs of the zodiac, with the rising and setting of the sun, the various phases of the moon, and other ornaments and indications of time.

On the left hand of this quadrangle is the great old hall, in which, by her late majesty’s command, was erected a theatre, wherein it was intended that two plays should have been acted every week, during the time of the court’s continuance there; but Mr. Colley Cibber observes, that only seven plays were performed in it, by the players from Drury Lane, the summer when it was raised, and one afterwards for the entertainment of the duke of Lorrain, afterwards emperor of Germany. In the front is a portal of brick, decorated with four Cæsars heads without names.

On the opposite side of this quadrangle is a stone colonnade of fourteen columns, and two pilasters of the Ionic order, with an entablature and balustrade at the top, adorned in the middle with two large vases.

This

This leads to the great stair-case, adorned with iron ballusters curiously wrought and gilt, the whole erected on porphyry. From the ceiling hangs, by a strong brass chain gilt, a large glass lanthorn, which holds sixteen candles, and has an imperial crown at the top. This stair-case, with the ceiling, were painted by Signor Verrio, an Italian, by order of king William III.

At the top, on the left side, are Apollo and the nine Muses, at whose feet sits the god Pan with his unequal reeds, and a little below them the goddesses Ceres, holding in one hand a wheat sheaf, and with the other pointing to loaves of bread; at her feet is Flora, surrounded by her attendants, and holding in her right hand a chaplet of flowers: near her are the two river gods, Thame and Isis, with their urns; and a large table in the middle, upon which is a quantity of rich plate, decorated with flowers.

On the ceiling are Jupiter and Juno, with Ganymede riding on Jupiter's eagle, and offering the cup. Juno's peacock is in the front: one of the Parcs, with her scissars in her hand, seems to wait for Jove's orders to cut the thread of life. These figures are covered with a fine canopy surrounded with the signs of the zodiac, and by several zephyrs, with flowers in their hands; and on one side of them is Fame with her two trumpets.

Beneath is a beautiful figure of Venus riding on a swan, Mars addressing himself to her as a lover, and Cupid riding on another swan.

On the right hand are Pluto and Proserpine, Cælus and Terra, Cybele crowned with a tower, and others. Neptune and Amphitrite are in the front, and two attendants are serving them with nectar and fruit. Bacchus is leaning on a rich ewer, and, being accompanied by his attendants, places his left hand on the head of Silenus, who sits on an ass that is fallen down, he seeming to catch at a table, to which Diana above is pointing. The table is supported by eagles; on one side of it sits Romulus, the founder of Rome, with a wolf; and on the other side of it is Hercules leaning on his club. Peace in her right hand holds a laurel, and in her left a palm over the head of Æneas, who seems inviting the twelve Cæsars, among whom is Spuria the soothsayer, to a celestial banquet. Over their heads hovers the genius of Rome, with a flaming sword, the emblem of destruction, and a bridle, the emblem of government, both in her right hand.

The next is the emperor Julian writing at a table, while Mercury dictates to him.

Over the door at the head of the stairs is a funeral pile, done in stone colour; and under the above paintings are thirty-six pannels, representing trophies of war, and other decorations in the same colour.

From the stair-case we pass into the guard-chamber, which is very large and spacious, it being upwards of sixty feet long, and forty feet wide. This room contains arms for five thousand men, curiously placed in various forms. There are here pilasters of pikes and bayonets on each side sixteen pannels that go round the room; with variety of other ornaments, as muskets in chequer-work, stars made of bayonets, swords, &c.

The next is the king's first presence chamber, which is hung with rich old tapestry. The ceiling is vaulted, and from the centre hangs a fine lustre of nineteen branches. Fronting the door are the canopy and chair of state, which, as well as the stools, are of crimson damask: on the back part of the canopy are the king's arms, and round the vallance a crown and cypher embroidered in gold.

On the left hand of the entrance, behind the door, is a fine picture about eighteen feet by fifteen, by Sir Godfrey Kneller. King William III. is in armour on a stately grey horse, trampling on trophies of war, by which lies a flaming torch. At the top, in the clouds, Mercury and Peace support his helmet, decorated with laurel, and a Cupid holds a scroll. On the bottom part of the picture appear Neptune and his attendants by the side of a rock, welcoming the hero on shore; and at a distance is seen a fleet of ships, their sails swelled with the east wind. In the front ground, Plenty, with her cornu-

copia, offers him an olive branch, and Flora presents flowers.

Over the chimney is a whole length of the marquis of Hamilton, lord steward of the household to K. Charles I. by Van Somer; and over the doors are two pieces of architecture, finely executed by Rosio.

The next room, which is called the second presence chamber, is spacious, and has a vaulted ceiling, from the centre of which hangs a gilt chandelier of twelve branches. The tapestry is ancient, but very rich, the lights being all gold, and the shadows silk; the subjects are, Hercules and the Hydra, and Midas with his ass's ears. The chair of state and stools are of crimson damask, fringed with the same colour. Over the chimney is a whole length of Christiern IV. king of Denmark, by Van Somer. This picture, as most of the large ones are, is decorated round the frame on the outside with festoons of fruit and flowers, finely carved in high-relief. Over the three doors are pieces of ruins and landscapes, by Rosio. In this room are also two fine marble tables, with two pier glasses, and two pair of gilt stands.

The fourth room is very lofty; in the middle hangs a beautiful chased silver chandelier of sixteen branches. Here is a fine canopy of state, with the window curtains, chair and stools, of rich crimson damask laced and fringed with gold. The tapestry, which represents part of the story of Abraham, is fine. Over the chimney is a whole length picture of Elizabeth queen of Bohemia, the daughter of king James I. and over each of the two doors is a Madona, by Domenico Fetti.

In the fifth room is also a chair of state, and stools; the window curtains are tissue, with a silver ground; there are silver sconces fastened to the tapestry, which is richly woven with gold, but is very ancient; the subject is Abraham sending his servants to get a wife for Isaac. Over the chimney-piece is an admirable whole length picture of king Charles I. by Van Dyke; and over the doors are two capital pictures; the first is David with Goliath's head, by Fetti; the other the holy family, by Correggio.

In the king's state bed-chamber is a crimson velvet bed, laced with gold, having plumes of white feathers on the top. This room, which is very spacious, is hung round with tapestry representing the history of Joshua, about which are eight silver sconces chased with the Judgment of Solomon. The ceiling, which was painted by Verrio, represents Endymion lying with his head in the lap of Morpheus, and Diana admiring him as he sleeps. On another part of the ceiling is a fine figure of Somnus, or Sleep, with his attendants; and in the border are four landscapes, and four boys with baskets of flowers intermixed with poppies. Over the doors are two flower pieces, finely painted by Baptist; and over the chimney is a whole length of the dutchess of York, by Van Somer.

In the king's private bed-chamber, the bed is of crimson damask, and the room hung with fine tapestry, the subject of which is Solbay fight.

The king's dressing-room, which is about twelve feet long, and six feet wide, has the ceiling painted by Verrio. Mars is sleeping in Venus's lap, while several Cupids steal away his armour, sword and spear, and others are binding his legs and arms with fetters of roses. The borders are decorated with jessamin, orange-trees in pots, and several sorts of birds. Over the doors are fine flower-pieces, by Baptist. The room is hung with straw-coloured India damask, and the chair, stools and screen, are covered with the same.

The king's writing-closet is of a triangular form, and has two windows. The hangings and stools are of a pea-green India damask. A glass is here so placed, as to shew all the rooms on that side of the building in one view. Over each door is a flower-piece by Baptist; and over the chimney a fine picture of a great variety of birds, by Bougdane. There is here a fine collection of china.

Queen Mary's closet is hung with needle-work, said to be wrought with her own hand: there are also an easy chair, four others, and a screen; all said to be the work of that excellent queen. The work is extremely neat;

the figures are well shadowed, perhaps equal to the best tapestry, and shew great judgment in drawing. Over the chimney-piece is an old painting, said to be Raphael's, representing Jupiter's throne, by which is the thunder, and his eagle in the clouds.

The queen's gallery, which is about seventy feet long, and twenty-five feet wide, is hung with seven beautiful pieces of tapestry; representing the history of Alexander the Great, and done after the famous paintings of Le Brun; they are however not placed according to chronology, for some of the last actions of Alexander's life are placed before those which preceded them. Under that part of the tapestry which represents the story of Alexander and Diogenes, and which is placed over the chimney-piece, is a very neat bust of a Venus in alabaster, standing upon an oval looking-glass, under which are two doves billing in basso relievo. Among the other furniture in this gallery, are two very fine tables of Egyptian marble.

The ceiling of the queen's state bed-chamber is finely painted by Sir J. Thornhill, who has represented Aurora rising out of the ocean in her golden chariot, drawn by four white horses. The bed is of crimson damask; and besides other furniture, the room is adorned with a glass lustre with silver sockets. Over a large marble chimney-piece is a whole length of king James I. by Van Somer. At his right hand, over one of the doors, is queen Anne, his consort; on his left, their daughter, the princess Elizabeth, afterwards queen of Bohemia; both by Van Somer. Over the other door is a beautiful whole length of Henry prince of Wales, their eldest son, by Van Dyke. In the cornice are four other portraits, one on each side, viz. king George I. his late majesty king George II. the late queen Caroline, and the late prince of Wales.

The queen's drawing-room has the ceiling painted by Signor Verrio; in the middle of which is the late queen Anne, under the character of Justice, holding the scales in one hand, and the sword in the other: she is dressed in a purple robe lined with ermine, and Neptune and Britannia are holding a crown over her head. The room is hung with green damask, upon which are placed nine pictures, three on each side of the room, and three at the end. These were formerly all in one piece of a great length, as may be very plainly seen from some of the figures being cut asunder, and placed in different pieces. The whole is the triumph of Julius Cæsar, and was a long procession of soldiers, priests, officers of state, &c. at the end of which that emperor appears in his triumphal chariot, with Victory holding a laurel crown over his head. It is painted in water colours upon canvas, by Andrea Mantegna.

The queen's state audience room is hung with rich tapestry, representing the children of Israel carrying the twelve stones to the river Jordan, as mentioned in Joshua iv. Here is a fine canopy of state, and five pictures at full length, the duke, dutchess, and marchioness of Brunswick, their daughter; the dutchess of Lenox, and Margaret queen of Scots, all by Holbein.

The prince of Wales's preference chamber is hung with tapestry wrought with the story of Tobit and Tobias. Here is a canopy of state of green damask: over one of the doors is Guzman, and over another Gundamor, two Spanish ambassadors: over the third is Madam Chatillon, the French admiral's lady; and over the chimney, Lewis XIII. of France, with a walking stick in his hand, and a dog by his side, all by Holbein.

The prince of Wales's drawing-room is hung with tapestry, representing Elymas the forcerer struck with blindness; this is taken from one of the cartoons. Over the chimney-piece is the duke of Wirtemberg: over one of the doors is a whole length of the wife of Philip II. king of Spain; and over the other, a whole length of count Mansfield, general of the Spaniards in the Low Countries, all by Holbein.

The prince of Wales's bed-chamber has a bed of green damask, and four pictures also done by Holbein, viz. over the chimney-piece is a whole length of the duke of Lunenburg, great grandfather to his present majesty. Over one of the doors, Philip II. king of

Spain; over another, the consort of Christiern IV. king of Denmark; and over the third, a whole length of the prince of Parma, governor of the Netherlands.

In the private dining-room are four pictures of the defeat of the Spanish Armada, by Vande Velde; and over the chimney a very fine one, by Van Dyke, of the lord Effingham Howard, lord high admiral of England.

In the Admiral's gallery are the pictures of the following celebrated admirals, Sir George Rooke, Sir Cloudsley Shovel, Sir John Leake, the lord Torrington, admiral Churchill, Sir Stafford Fairborne, Sir John Jennings, Sir Thomas Hopson, admiral Beaumont, Sir Thomas Dilks, admiral Bembo, admiral Whetstone, admiral Wishart, admiral Graydon, admiral Munden; all painted by Dahl, and Sir Godfrey Kneller.

In the room of Beauties, nine ladies are placed in the following order: the lady Peterborough, the lady Ranclagh, the lady Middleton, Miss Pitt, the dutchess of St. Alban's, lady Essex, lady Dorset, queen Mary, and the dutchess of Grafton. Queen Mary was painted by Wissing, and all the rest by Sir Godfrey Kneller.

In the Cartoon gallery were the celebrated cartoons of Raphael Urbino, so called from their being painted on paper. But they are now removed to the Queen's Palace, and have been already described.

Over the chimney-piece in this gallery, is a fine bas-relief, in white marble, of Venus drawn in her chariot, and attended by several Cupids.

We come next to the queen's stair-case, where the ceiling is painted by Vick. Here is king Charles II. and Catharine his queen, with the duke of Buckingham representing Science in the habit of Mercury, while Envy is struck down by naked boys. There are also other ornaments done by Mr. Kent.

From the queen's stair-case we descend into a new quadrangle, in the middle of which is a round basin, and four large lamps on pedestals of iron-work; and on the right hand, over the windows, are the twelve labours of Hercules done in fresco.

We shall conclude our account with observing, that the whole palace consists of three quadrangles. The first and second are Gothic, but in the latter is a most beautiful colonade of the Ionic order, the columns in couplets, built by Sir Christopher Wren. Through this, as was before observed, you pass into the third court or quadrangle, in which are the royal apartments, which are magnificently built of brick and stone by king William III. The gardens are not in the present natural stile, but in that which prevailed some years ago, when mathematical figures were preferred to natural forms.

Near this palace is a fine wooden bridge over the Thames, finished a few years since, and has been of very great advantage to this part of the county.

Besides the royal palaces, there are several seats belonging to the nobility and gentry in the neighbourhood, several of which merit particular notice in this work.

At Cheswick, situated on the north bank of the Thames, about four miles from London, are two manors, one belonging to the prebendary of Cheswick in St. Paul's cathedral; and the other called the Dean's manor, from its belonging to the dean and chapter of St. Paul's. In this village there is a charity-school, and it is adorned with several elegant seats, as the earl of Shrewsbury's, the earl of Grantham's, now colonel Elliot's, the late lord Wilmington's, &c. But the most remarkable of the kind is the late earl of Burlington's, which was a plain, commodious building, with good offices about it; but a part of the old edifice being some years ago destroyed by fire, his lordship erected near it a beautiful villa, which, for elegance of taste, surpasses every thing of its kind in England. The court in the front, which is of a proportionable size with the building, is gravelled, and constantly kept very neat. On each side are yew hedges in pannels, with termini placed at a proper distance; and in the front of these hedges are two rows of cedars of Libanus, which, at a small distance, have a fine effect, the dark shade of these solemn evergreens affording a pleasing contrast to the whiteness of the elegant building that appears between them,

them, the view of which from the road surprizes you in a most agreeable manner.

The ascent to the house is by a noble flight of steps, on one side of which is the statue of Palladio, and on the other that of Inigo Jones. The portico is supported by six fine fluted columns of the Corinthian order, with a pediment very elegant, and the cornice, frieze and architrave, as rich as possible. This magnificent front strikes all who behold it with an uncommon pleasure and surprize.

The octagonal saloon finishing at top in a dome, through which it is enlightened, is also very elegant. The other rooms are extremely beautiful, and are finely furnished with pictures of the great masters, an account of which is here annexed. It were to be wished this house had been built to a larger scale, that the grandeur might have equalled the elegance.

Though the other front towards the garden is plainer, yet it is in a very bold, noble and masterly stile, and has at the same time a pleasing simplicity, as hath also the side front towards the serpentine river, which is different from the two others. The inside of this structure is finished with the utmost elegance; the ceilings are richly gilt and painted, and the rooms adorned with some of the best pictures in Europe. In the gardens, which are very beautiful, the vistas are terminated by a temple, obelisk, or some such ornament, which produce a most agreeable effect.

The gardens are laid out in the finest taste: on descending from the back part of the house, you enter a verdant lawn planted with clumps of evergreens, between which are two rows of large stone vases. At the ends next the house are two wolves in stone, done by the celebrated Scheemaker, the statuary: at the farther end are two large lions, and the view is terminated by three fine antique statues, dug up in Adrian's garden at Rome, with stone seats between them, and behind a close plantation of evergreens.

On turning to the house on the right hand, an open grove of forest trees affords a view of the orangery, which is seen as perfectly as if the trees were planted on the lawn; and when the orange trees are in flower, their fragrance is diffused over the whole lawn to the house. These are separated from the lawn by a fosse, to secure them from being injured by the persons admitted to walk in the garden.

On leaving the house to the left, an easy slope covered with short grass leads down to the serpentine river, on the side whereof are clumps of evergreens, with agreeable breaks, between which the water is seen; and at the farther end is an opening into an inclosure, where are a Roman temple, and an obelisk, with grass slopes, and in the middle a circular piece of water.

From hence you are led to the wilderness, through which are three strait avenues terminated by three different edifices; and within the quarters are serpentine walks, through which you may ramble near a mile in the shade. On each side the serpentine river are verdant walks, which accompany the river in all its turnings. On the right hand of this river is a building that is the exact model of the portico of the church of Covent-garden; on the left is a wilderness laid out in regular walks; and in the middle is a Palladian wooden bridge over the river.

With the earth dug from the bed of this river, his lordship has raised a terrace, that affords a prospect of the adjacent country; which, when the tide is up, is greatly enlivened by the view of the boats and barges passing along the river Thames.

 Liberality and Modesty, after Guido.

Sion House, one of the seats of the right honourable the duke and dutchess of Northumberland, stands upon the banks of the Thames, between Brentford and Isleworth in Middlesex, and opposite to the King's Garden at Richmond. It is called Sion from a monastery of the same name, which was founded by Henry V. in 1414, very near the place where the house now stands, and was endowed with one thousand marks a year, for the maintenance of sixty nuns, including the abbess and twenty-five men, and was dedicated to St. Saviour and St. Bridget, from the latter of whom the nuns, &c. were called Bridgettines, and were of the order of Augustines, as reformed by some new regulations made by the aforesaid Bridget.

Sion was almost one of the first of the monasteries that was suppressed by Henry VIII. perhaps not on account of any great irregularities of behaviour which had been discovered in it by the visitors, but because the members of that society had been remarkably favourable to the king's declared enemies, and particularly to the maid of Kent; for she met with a very friendly reception amongst them, and so far excited the curiosity of the neighbourhood, as to induce the famous Sir Thomas More to have two private conferences with her at this very place. When the monastery was suppressed, its revenues, according to Speed, amounted to one thousand nine hundred and forty-four pounds, eleven shillings and eleven-pence three farthings; and on account of its fine situation, it was not sold or given immediately to any court-favourite, but appropriated to the king's own use. And accordingly we find, that when the corpse of Henry VIII. was to be removed from Westminster to Windsor to be interred, it lay the first night, not at Richmond, as is commonly supposed, but at Sion; which by this means became the scene in which a prophecy was supposed to be fulfilled. For father Peto, preaching before the king at Greenwich in 1534, told him, that the dogs would lick his blood as they had done Ahab's. Now, as the king died of a dropsical disorder, and had been dead a fortnight before he was removed to
 Sion,

Sion, it so happened, that some corrupted matter of a bloody colour ran through the coffin at that place. Whereupon the incident, though only a natural consequence of the aforesaid circumstances, was misconstrued into a completion of Peto's pretended prophecy, and considered as a piece of divine justice inflicted upon the king for having forced the Bridgettines from their religious sanctuary.

In the next reign the monastery was given by the king to his uncle the duke of Somerset the Protector, who in 1547 (as is generally supposed) began to build Sion House, and finished the shell of it, as it now remains, excepting a few alterations, which will be mentioned in their proper places. The house is built on the very spot where the church belonging to the monastery formerly stood, and is a very large, venerable, and majestic structure, built of white stone, in the form of a hollow square, so that it has four external, and as many internal fronts; the latter of which surround a square court in the middle. The roof is flat, covered with lead, and surrounded with indented battlements, like the walls of a fortified city. Upon every one of the four outward angles of the roof, there is a square turret, flat-roofed, and embattled like the other parts of the building. The house is three stories high, and the east front, which faces the Thames, is supported by arches, forming a fine piazza. The gardens formed two square areas, inclosed with high walls before the east and west fronts, and were laid out and finished in a very grand manner; but being made at a time when extensive views were judged to be inconsistent with that solemn reserve and stately privacy affected by the great, they were so situated as to deprive the house of every beautiful prospect which the neighbourhood afforded. None of them at least could be seen from the lower apartments. To remedy in some measure that inconvenience, the Protector built a very high triangular terrace in the angle between the walls of the two gardens; and this it was that his enemies afterwards did not scruple to call a fortification, and to insinuate that it was one proof, amongst many others, which they alledged of his having formed a design very dangerous to the liberties of the king and people. Such was the state of the gardens as finished by the Protector. After his attainder and execution on the twenty-second of January 1552, Sion was confiscated to the crown. Whereupon the furniture of the apartments, in which the duke had lived, (and they were probably a part of the old monastery) were given to Sir John Wroth the keeper, and the new house, that is, the present house at Sion, to the duke of Northumberland, which then became the residence of his son, the lord Guilford, and his daughter-in-law, the unfortunate lady Jane Grey. The duke being beheaded on the twenty-second of August, 1553, Sion house once more reverted to the crown. Three years after this, queen Mary restored it to the Bridgettines; and it remained in their possession until the society was expelled by queen Elizabeth in the first year of her reign. Such of the nuns as persisted in their errors carried away their portable treasure, and settled successively at Zurickzee in Zealand, at Mechlin, Roan; and lastly at Lisbon, where the society still subsists. Some years after this second dissolution, which Sion had undergone as a monastery, it was granted, by a lease of a long term, to Henry earl of Northumberland, who, in consideration of his eminent services to the government, was permitted to enjoy it by paying a very small rent as an acknowledgment, and even that, when offered, was generally remitted.

King James I. considered his lordship no longer as a tenant, but gave Sion to him and his heirs for ever. Many improvements were made in his time; for it appears from one of his lordship's letters to the king in 1613, that he had laid out nine thousand pounds in the house and gardens, which sum was probably expended in finishing them according to the Protector's plan. His son Algernon, afterwards appointed lord high admiral of England, succeeded to the estate in November 1632. He employed Inigo Jones to new-face the inner court, to make many alterations in the apartments, and

to finish the great hall in the manner in which it at present appears.

It must not be omitted in the history of this place, that the dukes of York and Gloucester, and the princess Elizabeth, were sent hither by an order of the parliament agreed upon August twenty-seventh, 1646, and, according to lord Clarendon, were treated by the earl and countess of Northumberland in all respects as was most suitable to their birth. The unhappy king frequently visited them at Sion in 1647, and thought it a very great alleviation of his misfortunes to find his children so happy in their confinement. The duke of Gloucester and the princess Elizabeth continued at Sion till 1649, at which time the earl resigned them to the care of his sister, the countess of Leicester.

May 30th 1682, Charles duke of Somerset married the lady Elizabeth Percy, the only daughter and heiress of Josceline earl of Northumberland, by which means Sion, and the immense estate of the Percies, became his Grace's property. The duke and dutchess lent this house at Sion to the princess of Denmark, who honoured it with her residence during the time of a misunderstanding which arose between her Royal Highness, and her sister, queen Mary.

Upon the death of Charles duke of Somerset, December 2, 1748, Algernon earl of Hertford, his only surviving son, succeeded to the title and a vast estate, and soon after gave Sion to his daughter and son-in-law, the present dutchess and duke of Northumberland, to whose fine taste and liberality are owing the many and great improvements which have made the gardens at Sion so universally admired.

The old gardens, as we have already observed, were indeed very grand and magnificent, according to the fashion of the age in which they were made, but, in consequence of the taste that then prevailed, they deprived the lower apartments of almost every advantage of prospect, which the fine situation of Sion house naturally affords. To make the necessary alterations, required nothing less than his Grace's generosity. Accordingly, the high triangular terrace, which the Protector had raised at a great expence, was removed, the walls of the old gardens were taken down, and the ground before the house levelled, and it now forms a fine lawn, extending from Isleworth to Brentford. By these means also a beautiful prospect is opened into the king's gardens at Richmond, as well as up and down the Thames. Towards the Thames the lawn is bounded by an ha-ha, and a meadow; which his lordship ordered to be cut down into a gentle slope, so that the surface of the water may now be seen even from the lowest apartments, and the gardens. In consequence of these improvements, the most beautiful piece of scenery imaginable is formed before two of the principal fronts; for even the Thames itself seems to belong to the gardens, and the different sorts of vessels, which successively sail as it were through them, appear to be the property of their noble proprietor.

The house stands nearly in the middle point of that side of the lawn, which is the farthest from the Thames, and communicates with Isleworth and Brentford, either by means of the lawn or a fine gravel walk, which in some places runs along the side, and in others through the middle of a beautiful shrubbery; so that even in the most retired parts of this charming maze, where the prospect is most confined, almost the whole vegetable world rises up as it were in miniature around you, and presents you with every foreign shrub, plant, and flower, which can be adopted by the soil of this climate. His lordship has not only thus improved the ground where the old gardens stood, but has also made a very large addition to it, and separated the two parts, by making a new serpentine river. It communicates with the Thames, is well-stored with all sorts of river fish, and can be emptied and filled by means of a sluice, which is so contrived as to admit the fish into the new river, but to prevent their returning back again into the Thames. His Grace has also built two bridges, which form a communication between the two gardens; and has erected in that, which lies near Brentford, a stately Doric column, upon the top of which is a fine proportioned

statue of Flora, so judiciously placed, as to command as it were a distinct view of the situation over which she is supposed to preside.

The kitchen gardens are very large, lie at a very proper distance from the house, and contain every thing, as an hot-house, fire-walls, &c. The green-house is a very neat building with a Gothic front, designed by his lordship, in so light a style, as to be greatly admired. The back and end walls of it are the only remains of the old monastery. This building stands near a circular basin of water, well stored with gold and silver fish; and in the middle of the basin is a spouting fountain, which is well supplied, and plays without intermission.

What has hitherto been said is only an imperfect account of the several steps pursued in the planning and finishing of the gardens; to which we must add, that his Grace has also made many considerable alterations in the apartments of the east front over the long gallery, and intends to make many more in the other parts of the house, as he has lately done in the approach to it.

To conduct (as it were) the reader through the rooms, would be a task too difficult to be executed in an intelligible manner: however, we cannot help taking notice of the great gallery, which extends the whole length of the east front over the arcades, and of that immense quantity of old china vases, of different forms and sizes, which are crowded together in almost every apartment.

We must also inform the reader, that many fine prospects may be seen from the leads on the top of the house; for they command a view of the country to the distance of twelve or fourteen miles, and consequently the greatest part of London may be seen from them. To these observations we must add, that the gardens, when viewed from the top of the house, form a finer landscape than can easily be conceived.

In the history of Sion we should be guilty of an unpardonable omission, did we not mention the pedigree picture, which is perhaps one of the greatest curiosities of its kind in England, and exhibits the noble and royal connections of the Percies; all which are now united in the present dutchess of Northumberland, whose many virtues are an ornament to that high station of life, which has been for many centuries enjoyed by her illustrious progenitors.

Holland House is a very ancient structure in the neighbourhood of Kensington, and is now the seat of lord Holland. It stands upon an eminence, commanding a very fine prospect; but has nothing else besides its antiquity to recommend it.

Having thus described the two divisions of the capital, &c. situated on the north side of the river; we now proceed to the third division, or southern suburb of the metropolis, situated in the county of Surry. The Saxons called it Southwark, that is, a work or building to the south, on account of its situation with respect to that part properly called London, to which it is joined by London bridge.

The earliest mention of this place in history is in the year 1053, when it was a distinct corporation, governed by its own bailiff; and it continued so till the year 1327, when a grant was made of it to the city of London, the mayor of which was appointed the bailiff of this borough, and might govern it by his deputy. Sometime afterwards, the inhabitants recovered their former privileges; but in the reign of Edward VI. the crown granted it to the city of London, for six hundred and forty-seven pounds, two shillings and a penny; and in consideration of a farther sum of five hundred merks, paid to the crown by the city, it was annexed to the city, with a reservation of certain privileges enjoyed there by the archbishop of Canterbury, and some other ecclesiastics. By virtue of that grant, it continues subjected to the lord mayor of London, and his steward and bailiff; and is governed by one of the twenty-six aldermen of the city, under the name of Bridge Ward without. But as Southwark is divided into two parts, this is to be understood of the division called the Borough liberty, which consists of three of the six parishes belonging to this town, together with the greatest part of a fourth parish. For the city division, the lord mayor,

by his steward, holds a court of record every Monday at the sessions-house on St. Margaret's hill, in this borough, for all debts, damages and trespasses, within his limits.

The other division is called the Clink, or the Manor of Southwark, and is subdivided into the great Liberty, the Guildhall, and the king's Manor, for each of which subdivisions a court leet is held, where the constables, aleconners, and flesh-tasters are chosen, and such other business transacted. The Clink liberty is under the jurisdiction of the bishop of Winchester, who, besides a court leet, keeps a court of record here, by his steward and bailiff, for pleas of debt, damages and trespasses. Court-leets are also kept at Lambeth, Bermondsey, and Rotherhith, three small districts belonging to this borough.

The military government of Southwark is by the lord lieutenant of the county of Surry, and eleven deputy-lieutenants.

Southwark consists of the parishes of St. Olave, St. John at Horsleydown, St. Saviour, commonly called St. Mary Overy, St. George, St. Thomas, and Christ-church. These, together with the adjacent parishes of St. Mary at Lambeth, St. Mary Magdalen Bermondsey, St. Mary Newington, and St. Mary Rotherhith, compose a district of the metropolis, which extends itself along the south bank of the Thames, from Vauxhall to Deptford-bridge, about six miles twenty-three poles in length, and about a mile in breadth, from London-bridge to the extremity of Newington: and though this district is only a suburb of London, yet, for its extent and number of inhabitants, its charitable foundations, trade and wealth, few cities in England are equal to it.

In Southwark there is a comptroller for the bailiwick, and another prison for the Clink liberty, besides the King's Bench prison, and the Marshalsea prison and court.

The principal parish-church in Southwark is that of St. Saviour, which was formerly a priory of regular canons; and being dedicated to the Virgin Mary, and situated on the bank of a small river called the Ree, had the name of St. Mary Over-Ree, or Overy, given it, by which name it is still commonly known; notwithstanding the name of St. Mary Overy was changed to that of St. Saviour in the reign of Henry VIII. when it was united, by act of parliament, to two other parishes, one called St. Margaret's, and the other St. Mary Magdalen's. This church is built in the manner of a cathedral, with three isles, from east to west, and a cross isle. It is thought to be the largest parish church in England; the isles, from east to west, measuring two hundred and sixty-nine feet in length, and the cross isle one hundred and nine: the height within is forty-seven feet; and it has four spires, and a tower one hundred and fifty feet high.

In the parish of St. Saviour is the sessions-house, on St. Margaret's Hill, which was burnt down in 1677, but rebuilt in 1686; and on the south side has a niche, in which is a statue of king James II.

In this parish are four charity-schools, four alms-houses, and a work-house for the poor.

The church of St. George is a good building, erected in 1736, the old church being ruinous. In this parish there are a charity-school, an alms-house, a work-house, and a county bridewell, called the White Lion Prison.

Here also is an hospital called St. Peter's, founded by the fishmongers company, for twenty-two alms-people. It is neatly built, and consists of three quadrangles, with a chapel and a garden. The persons admitted are obliged by the statutes to bring household furniture with them, and to leave it to the house when they die, in order to defray the charges of their interment, and for the benefit of the alms-people who attend them in their sickness. They have each two very good rooms, three shillings a week, and fifteen shillings at Christmas, with a chaldron of coals, and a gown, once a year; and one of the pensioners, who reads prayers twice a day in the chapel, has an additional allowance of forty shillings a year.

Contiguous to St. Peter's hospital, is Hulbert's alms-house, founded in 1719 by the fish-mongers company,

for

for twenty poor men and women, who have much the same accommodation and allowance with those of St. Peter's, and are under the direction of the same company.

In Blackman-street, in this parish, there are eight alms-houses, founded in 1651, for sixteen poor people, one half to be put in by the drapers company, and the other half by the parishioners. Here is a chapel, which has been used also as a charity-school for the poor children of the parish.

St. Thomas's church was first erected by king Edward VI. for the use of the hospital of the same name, to which it is contiguous; but on the great increase of the houses and inhabitants in the precinct of the hospital, the church was made parochial, and a chapel was erected in the hospital, for the use of its patients. This church being decayed, was rebuilt in 1702.

In this parish, besides an alms-house and a charity-school, there are the hospitals of St. Thomas and Guy, two of the noblest endowments in England.

St. Thomas's hospital was first erected in 1215, by Peter de Rupibus, bishop of Winchester, who dedicated it to St. Thomas the Apostle, and endowed it with land to the amount of three hundred and forty-three pounds a year, from which time it was held of the abbots of Bermondsey; one of whom, in 1428, granted a right to the master of the hospital to hold all the lands it was then in possession of, belonging to the said abbot and convent, the whole revenue of which did not exceed two hundred and sixty-six pounds, seventeen shillings and six-pence *per annum*. In the year 1551, after the citizens of London had purchased of king Edward VI. the manor of Southwark and its appurtenances, of which this hospital was a part, they laid out eleven hundred pounds in repairing and enlarging the hospital, and immediately received into it two hundred and sixty poor, sick, and lame patients; upon which the king, in 1553, incorporated this hospital with those of Christ-church and Bridewell, in the city of London. The building being much decayed, three beautiful squares, adorned with colonades, were erected in 1693, by a voluntary subscription; to which, in 1732, the governors added a magnificent building, consisting of several wards, with proper offices. Though there was no estate belonging to this hospital when the city purchased it of king Edward VI. yet, by the bounty of the citizens, the annual disbursements have for many years amounted to eight thousand pounds; and it appears, that from 1728 to 1734 inclusive, the number of patients admitted into this hospital amounted to thirty-five thousand five hundred and thirty-eight, of which thirty-three thousand and ninety-seven were cured and discharged. The number of governors of this hospital, besides the lord mayor and aldermen, is uncertain, but they are seldom more than two hundred and sixty. The officers and servants are, a president, treasurer, three physicians, three surgeons, a clerk, a receiver, an apothecary, a steward, and a chaplain, besides the minister of the parish, who is paid by the hospital, a matron, a brewer and butler, a cook, assistant and servant, an assistant clerk in the compting-house, two porters, four beadles, nineteen sisters, as many nurses and watch-women, a chapel clerk and sexton, and one watchman. The house contains nineteen wards, and four hundred and seventy-four beds.

Guy's hospital stands very near St. Thomas's, and is perhaps the most extensive charitable foundation that ever was established by one man in private life. The founder, Thomas Guy, a bookseller in Lombard-street in London, lived to see the building roofed in; and at his death, in 1724, left two hundred and thirty-eight thousand, two hundred and ninety-two pounds sixteen shillings, including the expence of the building, to finish and endow it. This hospital consists of two spacious squares, containing twelve wards and four hundred and thirty-five beds. In the area of the principal square is a statue of the founder. Fifty-one gentlemen, of the founder's nomination, were, together with his nine executors, made a body corporate by act of parliament, with the title of president and governors of Guy's hospital, the number of governors not to exceed sixty;

out of this body committees are chosen, who fill up the vacancies of governors as they happen. Four hundred and two patients were at first admitted, according to the founder's will, and handsome salaries and wages were settled on the officers and servants of the hospital. The number of patients admitted into it, from 1728 to 1734 inclusive, was twelve thousand four hundred and two, of whom there were discharged ten thousand five hundred and forty-three. In July 1738, there were four hundred and six patients in the hospital, besides one thousand six hundred out-patients; and the total disbursements on account of the house amounted to seven thousand nine hundred and seventy-eight pounds, fourteen shillings and a penny *per annum*.

Newington, or Newton, to distinguish it from another town of the same name near London, is also called Newington Butts, from *butts*, at which the populace formerly used to shoot, and which were set up in this, as well as in many other towns in England, to exercise the inhabitants in the art of archery.

In the parish of Newington Butts are a charity-school, three alms-houses, and a work-house. In this parish also is Kennington Common, the place where criminals, convicted of capital offences in the borough of Southwark, are executed.

At Lambeth, the archbishops of Canterbury have long had a palace, originally built by Baldwin, archbishop of that see, in the year 1188, who first intended to have erected a superb structure at Hockington, near Lambeth; but the monks, with whom he was then at variance, obtained the pope's mandate against it: when taking down what he had erected, he removed the best of the materials to Lambeth, and there erected a palace, a college, and a church, having before purchased the ground of the bishop and convent of Rochester by a fair exchange.

In the year 1250, Boniface, archbishop of Canterbury, having, by his arrogance, rendered himself hateful to the citizens of London, retired, for the security of his person, to this palace; and finding it in a ruinous condition, rebuilt the whole north side, the archiepiscopal apartments, the library and cloisters, the guard-chamber, and the chapel.

From that time this palace became the residence of the greatest persons in the church, and was soon enlarged by many additional buildings: cardinal Pool erected the gate, which, for that time, is a noble piece of work. The Lollards-tower, so called from a room in it prepared for the imprisonment of the followers of Wickliff, the first British reformer, who were called Lollards, was finished by archbishop Chicheley, and remains a lasting monument of his cruelty and antichristian spirit. It is a small room, twelve feet long, and nine broad, planked with elm; and there still remain eight rings and staples, to which these Christians were chained for presuming to differ in opinion from that prelate.

The spacious hall was erected by Juxton; the brick edifice between the gate and that hall was begun by Sancroft, and finished by the great Tillotson.

From the present structure being thus erected at different periods of time, it is not at all surprising that it has little appearance of uniformity; but the edifice, though old, is, in most parts, strong; the corners are faced with rustic, and the top surrounded with battlements; but the principal apartments are well proportioned, and well lighted: the Gothic work about it is irregularly disposed, and is in itself irregular. Some of the inner rooms are too close and confined; but there are many others open and pleasant in themselves, with the advantage of being convenient, and of affording very agreeable prospects; for the palace being situated on the bank of the Thames, it enjoys a fine view up and down the river, and from the higher apartments an extensive prospect of the adjacent country.

The palace, with the rows of trees before it, and the church of Lambeth adjoining, when viewed from the Thames, makes a very pleasing and picturesque appearance.

In this archiepiscopal palace is a very fine library, founded in the year 1610 by archbishop Sancroft, who

left,

left, by will, all his books for the use of his successors. This library has since been very greatly increased by the benefactions of the archbishops Abbot, Sheldon, and Tennison, and consists of six hundred and seventeen volumes in manuscript, and above fourteen thousand five hundred printed books.

The church, which stands adjacent to the palace, is a very antique structure, dedicated to St. Mary. It has a square tower, and both that and the body of the church are crowned with battlements. In this parish are eight precincts, distinguished by the names of the archbishop's, the prince's, Vauxhall, Kennington, the Marsh, the Wall, Stockwell, and the dean's precinct. It is remarkable, that at Lambeth Wall is a spot of ground, containing an acre and nineteen poles, called Pedlar's Acre, which has belonged to the parish for time immemorial, and is said to have been given by a pedlar, on condition that his picture, with that of his dog, be perpetually preserved in painted glass in one of the windows of the church; which the parishioners complied with, and placed the pictures in the south-east window of the middle isle.

Here is a charity-school, founded by Richard Laurence, citizen and merchant of London, in the year 1661, for educating twenty poor children of the Marsh and Wall liberties, for which purpose he endowed it with thirty-five pounds *per annum*.

The village of Kennington, one of the eight precincts of Lambeth parish, has the honour of giving the title of earl to the duke of Cumberland.

Vauxhall, another precinct of the parish of Lambeth, is particularly remarkable for the pleasantness of its well known gardens, which have been many years converted into a place of genteel entertainment during the summer season.

These gardens are perhaps the first of the kind in the world. In the centre is a superb orchestra, containing a fine organ, and a band of music, with some of the best voices; and the seats, or boxes, are disposed to the best advantage, with respect to hearing the music. In most of the boxes are pictures painted from the designs of Mr. Hayman, on subjects admirably adapted to the place. But there are in the grand saloon several pictures painted with his own hand, one of which represents the success of lord Clive in the East Indies. These are all universally admired for the design, colouring, and expression.

The trees in these gardens are scattered with a pleasing confusion. At some distance from the orchestra are several noble vistas of very tall trees, where the spaces between each are filled up with neat hedges, and on the inside are planted flowers and sweet smelling shrubs. Some of these vistas terminate in a view of ruins, others in a prospect of the adjacent country, and some are adorned with the painted representations of triumphal arches.

There are also several statues, and in particular a very good one in marble, by the late Mr. Roubiliac, of the celebrated Mr. Handell, playing on a lyre, in the character of Orpheus. As Ranelagh has its rotunda, so here is also a rotunda and ball-room, finely illuminated, in which is an orchestra with an organ, where, if the evening proves rainy, the company may be safely sheltered and entertained.

When it grows dark, the garden near the orchestra is illuminated, almost in an instant, with about fifteen hundred glass lamps, which glitter among the trees, and render it exceeding brilliant; and soon after, a very extraordinary piece of machinery has of late been exhibited, on the inside of one of the hedges, near the entrance into the vistas: by removing a curtain, is shewn a very fine landscape, illuminated with concealed lights, in which the principal objects that strike the eye, are the cascade, or water-fall, and a miller's house. The exact appearance of water is seen flowing down a declivity, and turning the wheel of the mill: it rises up in foam at the bottom, and then glides away. This moving picture, attended with the noise of the water, has a very pleasing and surprising effect, both on the eye and ear; but we cannot help observing, with respect to this piece, that however well it is executed, yet the company being

obliged to wait till the curtain is drawn, and after beholding it for a few minutes, having it again suddenly concealed from their sight, when the exhibition is over for that evening, has too much the air of a raree-show. If it could have been contrived to make its appearance gradually, with the rising of the moon in the same picture, which might seem to enlighten the prospect, and at length, by degrees, become obscured, by the passing of that luminary behind a cloud, the effect would have been certainly much more agreeable.

MARKET TOWNS, &c. in Middlesex.

Hackney, a village in Middlesex, on the north-east side of London, is a very large and populous one, inhabited by such numbers of merchants and wealthy persons, that it is said there are near an hundred gentlemen's coaches kept. The parish has several hamlets belonging to it, among which are Clapton on the north, Dorleston and Shacklewell on the west, and Hummertown, which leads to Hackney Marsh, on the east. In this village are two meeting-houses, viz. a new presbyterian meeting near the church, and an independent meeting in Mare-street: besides a presbyterian meeting-house at Clapton. There are also here six boarding-schools, a free school, a charity-school, and several alms-houses.

Hackney church was a distinct rectory and vicarage in the year 1292, and dedicated to St. Augustine; but the knights templars having obtained a mill and other possessions in the parish, they were, upon the suppression of their order, granted to the knights templars of St. John of Jerusalem, from whom the church is supposed to have received the present appellation of St. John. However, it was not presented to by that name till after the year 1660. It is in the gift of Mr. Tyson, lord of the manor, but in ecclesiastical affairs is subject to the bishop of London.

At the bottom of Hackney Marsh there have been discovered, within these few years, the remains of a great stone causeway, which, by the Roman coins found there, appears to have been one of the famous highways made by the Romans.

This village being anciently celebrated for the numerous seats of the nobility and gentry it contained, this occasioned a great resort thither of persons of all ranks from the city of London, whereby so great a number of horses were daily hired in the city on that account, that at length all horses to be let received the common appellation of Hackney horses; which denomination has since been communicated to public coaches and chairs.

'Tis observable, that so lately as the year 1625, there were not above twenty Hackney coaches in the city of London, and the adjacent parts; and that these did not ply in the streets as at present; but those who had occasion for them, sent for them from the stables where they stood: but in 1635, the number of these coaches being greatly increased, they plied in the streets, which being then much narrower in many parts of London than at present, the common passages were obstructed, and rendered dangerous; and it was alledged, that by this great increase, the price of hay and other provender was much enhanced. Upon this a proclamation was published by his majesty king Charles I. on the nineteenth of January, strictly commanding, that after the twenty-fourth of June following, no Hackney coach should be used within the city and suburbs of London, except for carrying of people to and from their habitations in the country; and that no person whatsoever should be allowed to keep a coach in this city, except such persons as were capable of keeping four able horses fit for his majesty's service, which were at all times to be ready when called for, under a severe penalty. However, in 1654, Cromwell published an ordinance, by which he ordered that the Hackney coaches, which he limited to two hundred, should be under the care and government of the court of the lord mayor and aldermen. And in 1662, it was enacted by parliament, that all the Hackney coaches, which then amounted to four hundred, should annually pay the sum of five pounds each

each towards the charge of paving and cleaning the streets of London and Westminster. Since which time the number of Hackney coaches has been augmented to eight hundred, and both they and the Hackney chairs put under the government of the Hackney coach-office.

Islington, a large village on the north side of London, to which it is almost contiguous. It appears to have been built by the Saxons, and in the time of William the Conqueror, was called Isendon, or Isledon. By the south-west side of this village, is a fine reservoir called New River Head, which consists of a large basin, into which the New River discharges itself; part of the water is from thence conveyed by pipes to London, while another part is thrown by an engine through other pipes up hill to a reservoir, which lies much higher, in order to supply the highest parts of London.

The church is one of the prebends of St. Paul's; the old Gothic structure lately taken down was erected in the year 1503, and stood till 1751, when it being in a ruinous condition, the inhabitants applied to parliament for leave to rebuild it, and soon after erected the present structure, which is a very substantial brick edifice, though it does not want an air of lightness. The body is well enlightened, and the angles strengthened and decorated with a plain rustic. The floor is raised considerably above the level of the church-yard, and the door in the front is adorned with a portico, which consists of a dome supported by four Doric columns; but both the door and the portico appear too small for the rest of the building. The steeple consists of a tower, which rises square to a considerable height, terminated by a cornice supporting four vases, at the corners. Upon this part is placed an octangular balustrade, from within which rises the base of the dome in the same form, supporting Corinthian columns with their shafts wrought with rustic. Upon these rests the dome, and from its crown rises the spire, which is terminated by a ball and its fan. Though the body of the church is very large, the roof is supported without pillars, and the inside is extremely commodious, and adorned with an elegant plainness.

This parish is very extensive, and includes Upper and Lower Holloway, three sides of Newington Green, and part of King'sland. There are in Islington two independent meeting-houses, and a charity-school, founded in the year 1613, by dame Alice Owen, for educating thirty children. This foundation, together with that of a row of alms-houses, are under the care of the Brewers company. There is here also a spring of chalybeat water in a very pleasant garden, which for some years was honoured by the constant attendance of the princess Amelia, and many persons of quality, who drank the waters. To this place, which is called New Tunbridge Wells, many people resort, particularly during the summer, the price of drinking the waters being three-pence for each person. Near this place is a house of entertainment called Sadler's Wells, where, during the summer season, people are amused with rope-dancing, tumbling, and pantomime entertainments.

Mary la Bonne, thus called from its being supposed to signify St. Mary the Good; though its original name, according to Maitland, was Maryborne. This gentleman gives the following account of the rise of this village, which is now united to this great metropolis. The village of Tyborne going to decay, and its church, named St. John the Evangelist, left alone by the side of the highway, it was robbed of its books, vestments, bells, images, and other decorations; on which the parishioners petitioned the bishop of London for leave to take down their old, and erect a new church elsewhere, which being readily granted in the year 1400, they erected a new church where they had some time before built a chapel, and that structure being dedicated to the Virgin Mary, received the additional epithet of Borne, from its vicinity to the neighbouring brook or bourn.

This village, if it may be still called by that name, is almost joined by new buildings to this metropolis; and the new buildings this way are now increasing so very fast, that it will undoubtedly, in a very short time, be quite joined, and become a part of it. The old church, which was a mean edifice, was pulled down, and a new

one erected in 1741. This structure is built with brick in as plain a manner as possible. It has two series of small arched windows on each side, and the only ornaments are a vase at each corner, and a turret at the west end. There are here also a French meeting-house, a charity-school, and a place of public entertainment, which has a pleasant garden; and a band of vocal and instrumental music. This may be considered as a kind of humble imitation of Vauxhall.

Pancras, a small hamlet on the north-west side of London, in the road to Kentish Town. It has a church dedicated to St. Pancras, and called St. Pancras in the Fields, an old plain Gothic structure, with a square tower without a spire. It is a vulgar tradition that this church is of greater antiquity than that of St. Paul's cathedral, of which it is only a prebend; but this arises from a mistake; for the church of St. Pancras, termed the mother of St. Paul's, was situated in the city of Canterbury, and was changed from a Pagan temple to a Christian church by St. Austin the monk, in the year 598, when he dedicated it to St. Pancras.

The church-yard is a general burying-place for persons of the Romish religion. At a public house on the south side of the church is a medicinal spring.

The church, which stood on the north side of St. Pancras lane, near Queen-street, in Cheap ward, owed its name, as did the church mentioned in the above article, to St. Pancras, a young Phrygian nobleman, who suffered martyrdom under the emperor Dioclesian, for his strict adherence to the Christian religion. This church, which was a rectory, and one of the peculiars in this city belonging to the archbishop of Canterbury, was destroyed by the fire of London; and not being rebuilt, the parish was, by act of parliament, annexed to the church of St. Mary le Bow in Cheapside.

Highgate, a large and populous village in Middlesex, a little above four miles north of London, is so called from its high situation on the top of a hill, and a gate erected there above four hundred years ago, to receive toll for the bishop of London; upon an old miry road from Gray's Inn lane to Barnet, being turned through that bishop's park. The church, which is a very old edifice, is a chapel of ease to Pancras and Hornsey; and where it stands was formerly an hermitage, near which the lord chief baron Cholmondeley built and endowed a free school in 1562, which was enlarged in the year 1570 by Edwin Sandys, bishop of London, and a chapel added to it. There are also here several dissenting meeting-houses. On the side next London, the fineness of the prospect over the city, as far as Shooter's-hill, and below Greenwich, has occasioned several handsome edifices to be built; particularly a very fine house erected by the late Sir William Ashurst.

Hampstead, a pleasant village, situated near the top of a hill about four miles on the north-west side of London. On the summit of this hill is a heath, which is adorned with many gentlemen's houses, and extends about a mile every way, affording a most extensive and delightful prospect over the city as far as Shooter's-hill, and into the counties all around it. This village used to be formerly resorted to for its mineral waters, and there is here a fine assembly-room for dancing. Its old ruinous church, which was a chapel belonging to the lord of the manor, has been lately pulled down, and a new one is just erected in its room. There is besides a handsome chapel near the wells, built by the contribution of the inhabitants, who are chiefly citizens and merchants of London; and also a meeting-house.

Brentford, a market-town situated ten miles from London, received its name from a brook called Brent, which runs through the west part of the town, called Old Brentford, into the Thames. As it is a great thoroughfare to the west, it has a considerable trade, particularly in corn, both by land and the Thames. The church and market-house stand in that part of the town called New Brentford. It has also two charity-schools; though the church is only a chapel to Great Eling.

That part of it called Old Brentford is situated upon a fine rising bank close to the Thames, and is naturally capable of being made as beautiful a spot as any thing

of the kind. The opposite side of the river is Kew Green, which appears from hence to advantage.

Here is a weekly market on Tuesday, and annual fairs on the seventeenth, eighteenth, and nineteenth of May; and the twelfth, thirteenth, fourteenth, and fifteenth of September, for horses, black cattle, and hogs.

On the right hand of the road, between Turnhamgreen and Brentford, is Gunnersbury House, a noble and elegant structure built by Inigo Jones, or, as some say, by Mr. Web, who was son-in-law to Inigo Jones. Indeed the architecture shews, that if the plan was not drawn by that celebrated architect himself, it was designed by some of his scholars; for the building has that majestic boldness and simplicity which grace all the works of that excellent artist. It is situated on a rising ground; the approach to it from the garden is remarkably fine. The loggia has a beautiful appearance at a distance, and commands a fine prospect of the county of Surry, the river of Thames, and of all the meadows on its banks for some miles, and in clear weather, of even the city of London.

The apartments are extremely convenient and well contrived. The hall, which is large and spacious, is on each side supported by rows of columns, and from thence you ascend, by a noble flight of stairs, to a saloon, which is a double cube of twenty-five feet high, and most elegantly furnished. This fine room has an entrance into the portico on the back front, which is supported by columns, and from the fineness of the prospect over the Thames, is a delightful place to sit in, during the afternoon in the summer season; for it being contrived to face the south-east, the sun never shines on it after two o'clock; but extending its beams over the country, enlivens the beautiful landscape that lies before this part of the edifice. On entering the garden from the house, you ascend a noble terrace, which affords a delightful view of the neighbouring country; and from this terrace, which extends the whole breadth of the garden, you descend by a beautiful flight of steps, with a grand balustrade on each side. But the gardens are laid out too plain, having the walls in view on every side. This was the house of the late Henry Furnesse, Esq; who had a fine collection of pictures. It is now in the possession of the princess Amelia.

Uxbridge, a town in the road from London to Oxford, from the first of which it is distant eighteen miles and a half. Though it is entirely independent, and is governed by two bailiffs, two constables, and four headboroughs, it is only a hamlet to Great Hillington. The river Coln runs through it in two streams, full of trout, eels, and other fish; and over the main stream is a stone bridge that leads into Buckinghamshire. The church, or rather chapel, was built in the reign of Henry VI. This town has many good inns, and is particularly distinguished by the whiteness of the bread, particularly their rolls. There are many corn-mills at a small distance, and a considerable number of waggon loads of meal are carried from thence every week to London. Uxbridge gives the title of earl to the noble family of Paget.

Here is a market on Thursday, and two annual fairs, viz. the thirty-first of July, and the tenth of October, for horses, cows, and sheep.

Stains, a populous town situated on the Thames, nineteen miles from London. It obtained its name from the Saxon word Stana, or stone, because there anciently stood a boundary stone in this place, to denote the extent of the city of London's jurisdiction upon the river. It has a bridge over the Thames, and is governed by two constables, and four headboroughs appointed by his majesty's steward, on account of its being a lordship belonging to the crown. The church stands alone, at almost half a mile distance from the town.

Here is a market on Friday, and two annual fairs, viz. the eleventh of May, for horses and black cattle; and the twenty-ninth of September, for horses, black cattle, and sheep.

Harrow on the Hill is situated fifteen miles north-west from London, on the highest hill in the county, on the summit of which stands the church, which has a very

high spire. This parish is famous for a free-school, founded by Mr. John Lyons in the reign of queen Elizabeth; and every fourth of August, a select number of the scholars, dressed in the habit of archers, come with their bows, and shoot at a mark for a silver arrow.

Hounslow, a village twelve miles north of London, on the edge of the heath of the same name, which is equally famous for horse-races and robberies. There are here a chapel and a charity-school. The village belongs to two parishes, the north side of the street to Heston, and the south to Isleworth. In this place was formerly a convent of mendicant friars, who by their institution were to beg alms for the ransom of captives taken by the infidels. On its dissolution by king Henry VIII. that prince gave it to the lord Windfor, and it was afterwards purchased by Mr. Auditor Roan.

There is no weekly market at Hounslow, but two annual fairs, viz. Trinity Monday, and the Monday after Michaelmas-day, for horses, cows, and sheep.

Edgware, a town twelve miles from London, in the road to St. Alban's, Watford, and Harrow on the Hill, is situated on the very edge of the county of Middlesex. The old Roman way, called Watling Street, passes by here from London.

The late duke of Chandos built near this town one of the most noble seats in England, which he adorned and furnished at such vast expence, that it had scarce its equal in the kingdom. The great saloon or hall was painted by Paolucci, and the plaistering and gilding of the house was done by the famous Italian Pergotti. The columns supporting the buildings were all of marble; the grandstair-case was extremely fine; the steps were marble, and every step was one whole piece twenty-two feet in length.

The avenue was spacious and majestic; and as it afforded the view of two fronts, joined as it were in one, the distance not permitting you to see the angle that was in the centre, so you were agreeably deceived into the opinion, that the front of the house was twice as large as it really was. And yet, on approaching nearer, you were again surprized, by perceiving a winding passage opening, as it were, a new front to the eye of near an hundred and twenty feet wide, which you imagined not to have seen before.

The gardens were well designed, and the canals large and noble. The chapel was a singularity, both in its building and the beauty of the workmanship; and the late duke maintained there at one time a full choir, and had divine worship performed with the best music, after the manner of the chapel royal. But all this grandeur was soon at an end. The furniture and curiosities were brought to public auction, and this superb edifice quite demolished.

The land whereon this structure was erected, was lately purchased by Mr. Hallet, an eminent cabinet-maker, who acquired a large fortune in that business, and he has built an elegant small house upon the ruins of the duke of Chandos's large and magnificent seat.

Here is a market on Thursday, and a yearly fair on the fourth of May, for horses and cows.

Twickenham, a pleasant village, situated on the Thames between Teddington and Isleworth, and between two brooks that here fall into that river. The church, which is a modern edifice, rebuilt by the contribution of the inhabitants, is a fine Doric structure. Here is a charity-school for fifty boys, who are clothed and taught; and this delightful village is adorned with the seats of several persons of distinction, particularly on the bank of the river. To begin at the upper end; there is an elegant Gothic seat called Strawberry Hill, belonging to the Hon. Mr. Walpole; then, a beautiful house, late the earl of Radnor's, now in the possession of Mr. Hindley. The next of considerable note is Sir William Stanhope's, formerly the residence of our most celebrated poet Mr. Alexander Pope; then Mrs. Backwell's; and the last on this beautiful bank is Dr. Battie's, at present in the possession of Mr. Paulét. All these houses, besides several others on this delightful bank, enjoy a most pleasing prospect both up and down the river, perpetually enlivened with the west country navigation, and

and other moving pictures on the surface of this enchanting river. Then below the church, you have the fine seat of Mr. Whitchurch, that of the earl of Stratford, Mrs. Pitt; and at the entrance into the meadows, the elegant structure called Marble Hall, belonging to the countess of Suffolk. Still further down the stream, you have the small but very pretty house of Mr. Barlow; the larger and more grand one of Mr. Cambridge; and the sweet retirement called Twickenham Park, the residence of the countess of Montrath. This brings you down to Isleworth, which, from the entrance into the meadows at lady Suffolk's, is about a mile and a half on the bank of the river, opposite to Ham-walks and Richmond-hill, and is one of the most beautiful walks in England.

Endfield, a market-town near eleven miles from London. Almost in the center of Endfield Chace, are the ruins of an old house, said to have belonged to the earls of Essex. Here is a fine lodge for the ranger, and the skirts of the chace abound with handsome country houses belonging to the citizens of London. When king James I. resided at Theobalds, this chace was well stocked with deer, and all sorts of game; but in the civil wars it was stripped both of the game and timber, and even let out in farms: however, after the restoration, it was again laid open, woods were planted, and the whole chace afresh stocked with deer.

Here is a weekly market on Saturday, and two annual fairs, viz. the twenty-fifth of May, and the twenty-ninth of November, for horses, cows, and cheese.

Tottenham High-crofs, a village on the west side of the river Lee, five miles north-east from London in the road to Ware. David king of Scotland being possessed of this manor, after it had belonged to the earls of Northumberland and Chester, gave it to the monastery of the Trinity in London; but Henry VIII. granted it to William lord Howard of Effingham, who being afterwards attainted, it reverted again to the king, who then granted it to the dean and chapter of St. Paul's, to whom it still belongs. The present earl of Northumberland and the lord Colerain have seats here, and there are also a great number of pretty houses belonging to the citizens of London. The church stands on a hill, which has a little river called the Mosel at the bottom, to the west, north and east.

The parish is divided into four wards, viz. 1. Nether ward, in which stands the parsonage and vicarage. 2. Middle ward, comprehending Church-end and Marsh-street. 3. High Crofs ward, containing the hall, the mill, Page-green, and the High-crofs. And 4. Wood Green ward, which comprehends all the rest of the parish, and is bigger than the three other wards put together.

The crofs, which gives name to the place, was once much higher than it is at present, and upon that spot queen Eleanor's corpse was rested, when on the road from Lincolnshire to London. St. Loy's well, in this parish, is said to be always full, and never to run over; and the people report many strange cures performed at Bishop's Well. In 1596, an alms-house was founded here by one Zancher, a Spaniard, the first confectioner ever known in this kingdom: Here are also a free-school, and a charity-school for twenty-two girls, who are clothed and taught.

Bow, a village a little to the east of Mile-end, also called Stratford le Bow; is named Bow, from the stone arches of its bridge built over the river Lee, by Maud, the wife of Henry I. Its church, built by Henry II. was a chapel of ease to Stepney, but was lately made parochial.

This village is inhabited by many whitsters and scarlet dyers, and here has lately been set up a large manufactory of porcelain, which is brought to such perfection as to be very little inferior to that of China.

Here is an annual fair held on the Thursday, Friday, and Saturday, in Whitfun-week, for toys.

Bromley, a pleasant village near Bow, where was formerly a monastery. The great house here was built by Sir John Jacob, Bart. commissioner of the customs at the restoration, and afterwards became the seat of Sir

William Benfon, sheriff of London in the reign of queen Anne, the father to William Benfon, Esq; auditor of the Imprest, who some years ago sold it, with the manor and rectory, to Mr. Lloyd, a gentleman of Wales.

Acton, the name of two villages about six miles from London, in the Oxford road, noted for the medicinal wells in their neighbourhood, which were formerly much frequented during the summer months, but now very few visit them.

Eling, the name of two villages, distinguished by the epithets Great and Little, situated between Brentford and the Oxford road. Great Eling lies to the east of the other, and has a work-house and a charity-school, with a pretty church, in the tower of which are eight musical bells, and is the mother church of that of Old Brentford.

Fulham, a village situated on the banks of the Thames, four miles from London. The Danes encamped here in 879, and the place was held of the king by the canons of St. Paul's in the time of William the Conqueror. 'Tis now only remarkable for several gentlemen's seats, besides a palace of the bishop of London, who used it in summer; and for a wooden bridge over the Thames to Putney, where not only horses and carriages, but foot passengers also pay toll.

Ecclesiastical ANTIQUITIES in Middlesex.

As we found it would be impossible to describe every place in this populous county that has been remarkable from some religious structure, in the limits we are confined to, we determined to mention the ecclesiastical antiquities in an article by themselves, rather than omit them entirely, which we must otherwise have done.

In St. Martin's le Grand, not far from Newgate, in this city, there was a college, which, according to some writers, was founded about the year 677, by the British king Cadwallain; or by some Britons, in memory of that king: but there is greater reason to believe, that this college was founded in the year 700, by Victred, or Wythred, king of Kent, and rebuilt, and chiefly endowed, by two Saxon noblemen, Ingelricus, and his brother Girard, about the year 1056. This foundation was confirmed by William the Conqueror in 1068, and the church of the college made a royal free chapel, with several privileges annexed to it. The adjoining precinct was ordained a sanctuary, and exempted from ecclesiastical and civil jurisdiction. Here was a dean and several secular canons, till the college, and all the lands belonging to it, were given, by king Henry VII. to the abbot and convent of Westminster, in 1502.

Sir Jordan Briset gave fourteen acres of land in Clerkenwell, to one Robert, his chaplain, for building a religious house on it, for nuns or Grey monks, upon which there was a priory founded for Benedictine nuns, about the year 1100, and dedicated to God and the assumption of the Virgin Mary. This nunnery was valued, upon the dissolution, at two hundred and sixty-two pounds nineteen shillings a year.

Near West Smithfield, the same Sir Jordan Briset, about the year 1100, erected an house or hospital for the Knights Hospitalers of St. John of Jerusalem, the lord prior of which had precedence of all the lay barons in parliament, and chief power over all the preceptories, or smaller houses of this order, throughout England.

On a spot of ground within Aldgate, where one Syred had formerly begun to build a church, dedicated to the Holy Crofs and St. Mary Magdalen, queen Maud, in 1108, founded a monastery for canons regular of the order of St. Austin. This house was dedicated to the Trinity, and was so rich, that it surpassed all the priories in London and Middlesex. It was surrendered the twenty-third of Henry VIII. but the valuation is not recorded.

At St. Giles's, in the suburbs of London, there was an hospital for a master and several leprous persons, founded by queen Maud, the mastership of which was, in the twenty-seventh year of Edward I. granted to the monastery of Burton Lazars, in Leicestershire, and

continued

continued subordinate to that monastery till the time of the dissolution.

Raherus, who founded St. Bartholomew's hospital in London, began, in the year 1123, on the east side of West Smithfield, a church or monastery for black canons, which was finished in 1133, and dedicated to St. Bartholomew. The revenues of this monastery were valued, upon the dissolution, at six hundred and fifty-three pounds fifteen shillings *per annum*.

In Haliwell Fields, on the west side of Bishopsgate-street, without the gate, Robert Fitz-Gelran, canon of St. Paul's cathedral, before the year 1140, built a priory, which was dedicated to St. John Baptist, and valued, upon the dissolution, at two hundred and ninety-four pounds *per annum*.

The order of the brethren of the temple of Solomon at Jerusalem, commonly called Templars, or Knights of the Temple, having several manors and estates in most counties of England, did, about the beginning of the reign of king Stephen, settle in a house near Holborn Bars, called the Old Temple, which then became the chief house of their order in this kingdom. In that building they continued till the year 1185, when a more commodious habitation was erected for them in the place now called the Temple; and here they flourished under the government of a master, who was head of all the preceptories and houses of the order in England, till they were suppressed all over Europe, about the year 1312; upon which the Temple, with the greatest part of their other estates, was granted to the Knights Hospitalers of St. John of Jerusalem, who leased it to the students of the common law, in whose possession it still continues.

On the north side of Cheapside, in the city of London, Thomas Fitz-Theobald, and Agnes, his wife, sister to Thomas Becket, archbishop of Canterbury, about the end of the reign of king Henry II. founded an hospital, dedicated to the Virgin Mary, and to the same archbishop Becket, who was canonized as a saint and a martyr. It was built upon the site of houses formerly belonging to Gilbert Becket, father of the archbishop; and here the archbishop was born. This hospital, part of which is now Mercer's Chapel, was called the Hospital of St. Thomas of Acon, or Acres; and consisted of a master and several brethren, of the order of St. Austin, but of a particular sect of that order, which, about this time, was instituted in the Holy Land, and denominated *Militiæ Hospitalis S. Thomæ Martyris Cantuariensis de Acon*, being a branch of the Templars. The revenues of this hospital, upon the dissolution, were valued at two hundred and seventy-seven pounds thirteen shillings and four-pence *per annum*.

Henry de Northampton, canon of St. Paul's cathedral, founded an hospital, within the precincts of that church, before the year 1190.

In Spitalfields, Walter Brune, and Roseia, his wife, about the year 1197, founded an hospital of the order of St. Austin. It was dedicated to the Virgin Mary, and valued, upon the general dissolution, at four hundred and seventy-eight pounds, six shillings and six-pence *per annum*.

On London Bridge there was anciently a chapel, founded by a mason, dedicated to St. Thomas the Martyr, and endowed for two priests and four clerks.

In a court called St. Hellen's, on the east side of Bishopsgate-street, there was a priory of Benedictine monks, founded by William Fitz-William, a goldsmith, about the year 1210, and dedicated to the Holy Cross and St. Hellen. The revenues of this priory, before the dissolution, were valued at three hundred and fourteen pounds, two shillings and six-pence *per annum*.

The Black Friars coming into England about the year 1221, obtained an habitation near Holborn, on the west side of Chancery Lane, in or near the place where Lincoln's-Inn now stands. Here they lived about fifty-five years, and then obtained some ground in Castle Baynard ward, in the city, now called Black Friars, where, by the help of king Edward I. and his queen, Robert Kilwardby, archbishop of Canterbury, and other benefactors, they built a handsome church and

convent; and at the suppression, had yearly revenues to the amount of one hundred and four pounds, fifteen shillings and four-pence.

The Grey Friars coming to England in 1224, John Travers, one of the sheriffs of London, built a house for them in Cornhill, which proving too small, John Ewin, mercer, gave them some ground, which is now the site of Christ's Hospital, near Newgate, and here they erected a priory, in which they continued till the dissolution.

On the north side of Threadneedle-street, in 1231, there was a synagogue of the Jews, which K. Henry III. gave to the brethren of St. Antony of Vienna, in France, who converted it into an hospital, consisting of a master, two priests, a school-master, and twelve poor brethren, besides proctors and other officers and servants. The revenues of this hospital were valued, upon the suppression, at fifty-five pounds six shillings and eight-pence a year.

In Chancery Lane, in Farringdon Ward without, king Henry III. founded an hospital about the year 1231, for the instruction and maintenance of all such Jews as should be converted to the Christian faith. This house was under the government of a master, and two or three chaplains, and had a church, dedicated to the Virgin Mary, which is now the chapel of the Rolls.

In a place still called White Friars, on the south side of Fleet-street, between the Temple and Salisbury Court, the Carmelite or White Friars had an house and a church, built about the year 1241, by Sir Richard Gray, knight, and endowed, upon the dissolution, with yearly revenues valued at sixty-three pounds eleven shillings and four-pence.

Simon Fitz-Mary, alderman, and sheriff of London in the year 1247, upon the site of Bethlehem Hospital, founded a priory or hospital, for a prior, canons, brethren and sisters, of the order of Bethlehem, or the Star, in which the bishop of Bethlehem, in Judea, was to be entertained whenever he came into England; and to the visitation and correction of the bishop of Bethlehem, all the members of this house were subjected.

On the north side of Broad-street, near Bethlehem Hospital, in a place still called Austin Friars, Humphrey Bohun, earl of Hereford and Essex, in 1253, founded a priory for Friars Hermites of the order of St. Augustine, which, upon the dissolution, had yearly revenues valued at fifty-seven pounds and four-pence.

The Friars of the Sack, so called from sackcloth, the habit of the order, came to London in the year 1257, and settled first on the outside of Aldersgate; but king Henry III. in the year 1272, the fifty-sixth year of his reign, gave them a Jewish synagogue, on the south side of Lothbury, not far from the priory of the Austin Friars, where they continued till their order was dissolved in the council of Lyons in 1307.

In the time of Edward I. an hospital of the French order was founded in Whitecross-street, not far from Bethlehem Hospital, and dedicated to St. Giles; but it was dissolved by king Henry V. and given, with its possessions, to a friary of St. Giles.

In the time of Edward I. there was an hermitage or chapel, dedicated to St. James, and called St. James's Chapel on the Wall, from its situation near London Wall, at the north corner of Monkswell-street, which street took its name from a well in it, belonging to the monks of this chapel.

The chapel of St. James was in possession of the abbot and convent of Gerondon, in Leicestershire, who kept two Cistercian monks of their house in it.

Blanch, queen of Navarre, wife to Edmund earl of Lancaster, having encouraged some poor ladies of the order of St. Clare or Minorites, to come to England, her husband, Edmund, in 1293, built an abbey for them on the east side of the street now called the Minorities, without the city walls. It was dedicated to the Virgin Mary and St. Thomas, and had annual revenues, which, upon the suppression, were rated at three hundred and eleven pounds fifteen shillings and a penny.

A house of friars of the Holy Cross was founded in the parish of St. Olave, Hart-street, near Tower-Hill, in

in a place still called Crutched Friars, about the year 1298, by Ralph Hofier and William Saberns, and was endowed at the dissolution with fifty-two pounds thirteen shillings and four-pence *per annum*.

On the site of the college now called Sion College, William Elsing, citizen and mercer, in 1326, founded a college for a warden, four secular priests, and two clerks, together with an hospital for the lodging of one hundred old, blind, and poor persons of both sexes; blind, paralytic, and disabled priests, to be preferred; but in 1340, he changed the seculars of this college into five regular canons of the order of St. Austin. This house was dedicated to St. Mary, and endowed upon the suppression with one hundred and ninety-three pounds fifteen shillings and five-pence *per annum*.

Sir John Poultney, who had been several times lord mayor of London, in the year 1332, founded in Cannon-street a college, consisting of a master or warden, thirteen priests, and four choristers, dedicated to Jesus and Corpus Christi. The income of this college was rated, upon the suppression, at seventy-nine pounds seventeen shillings and eleven-pence *per annum*.

It is said that there were three hospitals, one near St. Andrew's church in Holborn, another in a street on the outside of Aldersgate, and a third near Cripplegate, all alien priories, and cells to the house of Cluay in France, but suppressed by king Henry V. among the other alien priories.

In the church-yard of Trinity-church, on the east side of the Tower of London, king Edward III. in the year 1349, founded a Cistercian abbey, which was made a royal free chapel, and was possessed, upon the dissolution, of yearly revenues valued at five hundred and forty-six pounds and ten-pence.

Near the church of St. Martin Vintry, in Vintry ward, there were thirteen alms-houses, erected in 1357 by Sir John Stodie, lord mayor of London.

In a royal free chapel, dedicated to St. Peter, within the Tower of London, king Edward III. erected a college, in which he settled four chaplains, under the government of a rector.

On the site where the Charterhouse hospital and school now stand, Sir Walter de Manny, a knight of the garter, in 1361 founded a priory for twenty-four Carthusian monks, who were possessed of revenues valued, upon the suppression, at six hundred and forty-two pounds and four-pence *per annum*. This priory was called the Salutation of the Mother of God.

In a chapel dedicated to St. Mary Magdalen and All Saints, near Guildhall, Adam Francis and Henry Frowick, in 1368, founded a college, consisting of a warden, seven priests, three clerks, and four choristers, with revenues valued on the suppression at only twelve pounds eighteen shillings and nine-pence *per annum*.

In 1380, William Walworth, lord mayor of London, who slew the rebel Wat Tyler, founded a college in the church of St. Michael, Crooked Lane, for a master and nine priests.

Twelve minor canons, belonging to the cathedral church of St. Paul, were incorporated in the eighteenth year of king Richard II. and made a body politic, with a warden and common seal.

Mr. Roger Holme, chancellor of the cathedral of St. Paul, before the year 1395, founded a college, consisting of seven priests, in a certain chapel situated near the north door of this cathedral, and dedicated it to the Holy Ghost.

A building called Lancaster College, in the parish of St. Gregory, near the cathedral of St. Paul, was granted the second year of Edward VI. to William Gunter, and is supposed to be the lodgings and common hall of the Chantry priests, established by king Henry IV. and by the executors of John of Gaunt, duke of Lancaster, in a chapel on the north side of the choir of St. Paul's.

On the east side of the quadrangle of Leadenhall, in the city of London, William Rouse, John Risby, and Thomas Ashby, priests, in 1456, founded a fraternity of sixty priests, besides other brethren and sisters.

In the church of St. Michael Royal, in Vintry ward, Sir Richard Whitingdon, several times lord mayor of

London, before the year 1424, founded a college, dedicated to the Holy Ghost and the Virgin Mary, for a master and four fellows, besides clerks and choristers; and also on the east side of the college, he founded an hospital for thirteen poor people, the chief of whom was called tutor. The revenues of this college were valued, upon the suppression, at no more than twenty pounds one shilling and eight-pence *per annum*.

Near Grocer's Hall, in a street called the Poultry, about the year 1429, seven alms-houses were built for the relief of so many poor aged brethren of the Grocer company.

In 1430, William Oliver, William Barneby, and John Stafford, chauntry priests in London, founded an hospital near the church of St. Augustine in the Wall, for poor impotent priests and brethren of the Papey. It belonged to the fraternity of St. Charity and St. John the Evangelist.

King Richard III. having rebuilt the chapel of our Lady, within the church of All-hallows, Barking, near the Tower of London, founded a college in it, consisting of secular priests.

There was a college of priests, called Jesus Commons, in Dowgate ward, near Skinners Hall.

Adjoining to the east side of Crutched Friars church, near the Tower of London, fourteen alms-houses were founded in 1521, by Sir John Milborn, lord mayor of London.

The collegiate church of St. Peter, Westminster, is said to have been first built about the year 610, by Sebert, king of the East Saxons, on the ruins of a Roman temple dedicated to Apollo; but being destroyed in the Danish wars, it was rebuilt by king Edgar in 958, when twelve monks were placed in it, who were but meanly provided for, till king Edward the Confessor, in 1049, began to rebuild the church and abbey, which he finished and endowed before the year 1066, from which time it continued in the hands of monks of the order of St. Benedict, till the general dissolution, when its possessions were valued at three thousand and thirty-three pounds seventeen shillings *per annum*.

King Henry VIII. in the thirty-second year of his reign, erected here a bishop's see, and converted the abbey church into a cathedral, with a dean and twelve prebendaries. The bishoprick was however suppressed in the year 1550, but the chapter continued.

In 1556, king Philip and queen Mary restored the abbot and monks; but in 1560, the abbey was a second time suppressed, and the church made collegiate, as it still remains, with a dean and twelve secular prebendaries, together with petty canons and other members of the choir, to the number of thirty, besides two school-masters, forty king's scholars, twelve alms-men, and many officers and servants.

On the site of St. James's palace, some citizens of London, before the Conquest, founded an hospital for the reception and maintenance of fourteen reprobous women, to whom were afterwards added eight brethren, to perform divine service. This house was dedicated to St. James, and rebuilt in the time of king Henry III. It was under the government of a master, till king Henry VI. granted the perpetual custody of it to Eton College. At the dissolution, it was valued at one hundred pounds *per annum*.

William Mareschal, earl of Pembroke, in the time of king Henry III. founded an hospital or chapel near Northumberland-house in the Strand. This hospital was dedicated to St. Mary, and was a cell to the priory of Rouncival, in the diocese of Pampelon in Navarre. It is said to have been suppressed among the alien priories in the time of Henry V. and to have been restored the fifteenth year of Edward IV.

The friars of the order of St. Mary de Areno had a house in the Strand, which was built for them by William de Arnaud, in the fifty-first year of Henry III. and here they continued after the suppression of the minor mendicant orders in 1307, till the death of Hugh de Ebor, the last friar of this order, in the tenth year of Edward II.

It has been already observed, that the House of Commons, in the city of Westminster, was originally a chapel, built by king Stephen, and dedicated to the saint of that name. It was made collegiate by king Edward III. for a dean, twelve secular canons, thirteen vicars, four clerks, six choristers, and other officers and servants, who were endowed with revenues, valued, upon the suppression, at one thousand and eighty-five pounds, ten shillings and five-pence *per annum*.

Within the Alms-house of the abbey, over against the old chapel of St. Anne, the lady Margaret, mother to king Henry VII. erected an alms-house for poor women, which is now converted into lodgings for the singing men of the college.

About the year 1505, king Henry VII. founded a hospital in the Savoy, for a master, four chaplains, and one hundred poor people. It was dedicated to Jesus, the Virgin Mary, and St. John the Baptist; and valued, upon the suppression, at five hundred and twenty-nine pounds five shillings and seven-pence *per annum*.

Some writers mention an house for lunatics in the parish of St. Martin's in the Fields, near the old village of Charing.

At Bermondsey, near the borough of Southwark, Aylwin Child, a citizen of London, about the year 1082, founded a church, dedicated to Jesus Christ, together with a convent of monks of the Cluniac order, who were procured from the priory de Caritate in France. This convent was made denizen in 1380, erected into an abbey in 1399, and endowed, before the dissolution, with a yearly income of four hundred and seventy-four pounds fourteen shillings and four-pence.

The church of St. Saviour, in the borough of Southwark, was founded long before the Conquest, as a house of sisters, by a maiden lady named Mary, who endowed the priory with the profits of a ferry cross the Thames; but the priory was afterwards converted, by a noble lady named Swithen, into a college of priests, who, instead of the ferry, erected a timber bridge; a stone bridge was afterwards built at the same place, and is now called London bridge. In 1106, this priory was again founded for canons regular, by William Pont de le Arch, and William Dauncy, knights; and was valued, upon the suppression, at six hundred and twenty-four pounds six shillings and six-pence *per annum*.

At Bermondsey there was an hospital dedicated to our Saviour, not long after the death of archbishop Thomas Becket; for Agnes his sister, and Theobald his nephew, were benefactors to it.

In 1213, Richard, prior of Bermondsey, built an alms-house or hospital, adjoining to the wall of his monastery, dedicated to St. Thomas of Canterbury, for converts and poor boys.

Near the borough of Southwark, there was, in the time of Edward II. an hospital for leprous persons, dedicated to St. Leonard.

At Stratford le Bow, or Bromley, near London, in the county of Middlesex, a Benedictine nunnery, dedicated to St. Leonard, was founded by William bishop of London, in the reign of William the Conqueror. At the general dissolution, here were 2 prioresses, and nine nuns, whose yearly revenues were one hundred and eight pounds one shilling and eleven-pence.

At Rislip, near Uxbridge, in this county, Ernulph de Heding, in the time of William the Conqueror, or William Rufus, founded a priory subordinate to the abbey of Bec in Normandy, but afterwards subject to the convent of Okeburn in Wiltshire.

At Kilborn, a village north-west of London, Herbert, abbot, and Osbert de Clara, prior of Westminster, about the end of the reign of king Henry I. founded a nunnery, dedicated to the Virgin Mary, and St. John the Baptist. It was of the Benedictine order, and subordinate to the abbey at Westminster, and had revenues valued, upon the suppression, at seventy-four pounds seven shillings and eleven-pence *per annum*.

The lady Joan, relict of Sir Robert Gray, knight, gave the manor of Hampton to the Hospitalers; and here seems to have been a house for some sisters of that order before the year 1180.

At Hounslow, a village south-west of Brentford, there was a priory before the year 1274, consisting of a master, chaplains, and brethren, or a prior and convent of friars, of the order of the Holy Trinity, for the redemption of captives. This priory was endowed, at the dissolution, with seventy-four pounds eight shillings and one penny *per annum*.

At Sion, near Brentford, king Henry V. in the year 1414, founded a monastery of the order of St. Augustine, which consisted of sixty nuns or sisters, one of whom was the lady abbess, thirteen priests, one of whom presided over the men by the name of Confessor, four deacons, and eight lay brethren. It was dedicated to Jesus Christ, the Virgin Mary, and St. Bridget; and was endowed, upon the suppression, with yearly revenues valued at one thousand seven hundred and thirty-one pounds, eight shillings and four-pence.

In a chapel at the west end of Sion abbey, John Somerset, chancellor of the exchequer, and king's chaplain, in the twenty-fifth year of Henry VI. founded a friary, hospital, or fraternity of the nine orders of Angels, consisting of a master and several brethren, who, at the dissolution, had forty pounds *per annum*.

Upon the top of a hill at Highgate, a village about four miles north of London, there was an ancient hermitage; and one William Pool, yeoman of the crown, founded an hospital below the hill in the reign of Edward IV.

Remarks on the HUSBANDRY of Middlesex.

The land in this county, for some miles round London, may be considered as one continued garden, interspersed with meadows and pastures, very little corn being sown in the neighbourhood of the capital. The quantity of manure supplied by the extensive cities of London and Westminster, enables the farmers to keep their grass-lands extremely rich, by which amazing crops of hay are produced. At a distance from London, their course of crops in general is, 1. fallow; 2. wheat; 3. oats, or pease; 4. clover and rye-grass. Considerable quantities of lucern are planted in various parts of the county, and generally to great advantage. Potatoes and turnips are also cultivated in most parts of the county. They plough three times for wheat, sow two bushels, and reckon in some parts five or six quarters a middling crop; but in others, three or four. Sometimes they sow beans, for which they give but one stirring; sow two bushels, hoe twice, and reap four quarters on a medium. For oats, they plough but once, sow four bushels, and reckon three quarters the medium. They plough twice or thrice for pease; sow two bushels, hoe them once or twice, and reckon four quarters their mean crop. For turnips they stir four times, and make the soil fine like that of a garden; hoe them twice; and, in the neighbourhood of the capital, send great quantities to market, and use the rest in feeding all kinds of cattle. They generally drive four horses in a line to each plough, whether the soil be light or heavy; turnip or bean land; and turn up an acre in a day. The grass land lets from two to three pounds an acre; and arable at thirty shillings on a medium. The price of labour is, in winter, one shilling and six-pence a day; in summer, from twenty-pence to two shillings, without beer. Reaping corn, from six to seven shillings per acre. Mowing corn, from one shilling and six-pence to two shillings; and mowing grass, three shillings per acre.

Curious PLANTS found in Middlesex.

Moon-wort, *Lunuria minor*, Ger. found on many of the commons, particularly near Acton.

Butterfly, or German Satyrion, *Orchis hermaphroditica*, Ger. found in the cane wood near Hampstead.

Male Satyrion, *Cynoforchis mas*, Ger. found in the fields near Islington.

Female Satyrion, *Cynoforchis moris fœmina*, Ger. found in the same fields with the former.

Male

Male Satyrion Royal, *Orebis palmata non maculata*, *Ray*, found in the meadows on the banks of the Thames.

Wild Valerian, *Valeriana sylvestris*, *Ger.* found in most of the upland pastures, and also in many watery places in this county.

Buckthorn, *Rhamus cathartica*, *J. B.* found in the hedges near Uxbridge.

Rough Spleen-wort, *Aspera minor*, *Park*, found in the woods near Hampstead-heath.

Wild Thyme, *Thymus sylvestris*, *Ger.* found in great plenty in most of the upland pastures, and on the downs and commons in this county.

Wood-pease, or Heath-pease, *Astragalus sylvaticus*, *Ger.* found among the heath near Hampstead, Uxbridge, and Hounslow.

Maiden-hair, *Atrantium*, found in various places of this county.

Ash-coloured ground-Liverwort, *Lichen terrestris cinereus*, *Ray*, found on most of the heath-grounds in Middlesex.

Crow-foot, *Ranunculus*, found in most of the meadows near the Thames.

REMAINS of ANTIQUITY not mentioned in the preceding Account of London, &c.

In Playhouse-yard, in Whitecross-street, are the ruins of a theatre, supposed to be the first that was erected in or near London, though there was another perhaps of a date not much later in Barbican. Nor is it to be wondered at that theatres were formerly built here, when it appears from Bridgewater Square in Barbican, Thanet, and Shaftesbury-houses, in Aldersgate-street, that this part of the town was the residence of the court and nobility.

In the parish of St. Saviour, in the borough of Southwark, is an inn called the Talbot Inn; and on the main beam of a room in this inn is an inscription, importing, that Sir Jeffrey Chaucer, and twenty-nine pilgrims, lay here in the year 1383, on their journey to Canterbury. This inn was much frequented anciently by the nobility and gentry; and though the sign is now the picture of a dog called a Talbot, yet the original sign was the representation of a coat without sleeves, such as is worn by the heralds at arms, and called a Tabard. By the same corruption, the Poll, or Head, which was the ancient sign of a barber's shop, is converted into a painted Stick, or Pole, and the Belle Savage into a Bell and Naked Man.

On the bank-side, near Winchester-house, there were formerly eighteen houses, called the Stews, licensed by the bishop of Winchester, with the sanction of an act of parliament, for keeping public whores, under certain

regulations, who were commonly called Winchester Geese.

Near Vauxhall are still to be seen the remains of a bastion and lines, cast up by the Romans, which, in the civil wars under king Charles I. were repaired for the security of London.

Near Bermondsey-street, in the parish of St. Mary Magdalen, Bermondsey, are the remains of a Roman fort, as plain, almost, as when it was first demolished.

Sun Tavern Fields, in the parish of Shadwell, were also a Roman coemetry, where, in 1615, coffins, urns, Roman coins, and other remains of antiquity, were dug up.

Here was found a lead coffin, inclosed in a stone one, containing the body of a woman, with a Cupid, cut in stone, upon her breast, an ivory sceptre in each hand, a large urn at her head, and another at her feet. Here were also several small urns, and a great number of glass vessels, full of white liquor.

In the parish of Islington, almost contiguous to London, is a field, called the Reedmoat, and also Six Acre Field, from the contents of it, which appears to have been an ancient fortress, inclosed with a rampart and ditch; and from its form, and the manner of the fortifications, is supposed to have been the Roman camp occupied by Suetonius Paulinus, after his retreat from London. Out of this camp, it is thought, he sallied upon the Britons, under the conduct of their queen, Boadicea, when he totally routed them. In the south-west angle of the field, is a square partition, or division, commonly called Jack Straw's Castle, which is supposed to have been the Roman general's prætorium, or tent.

Near Uxbridge are the remains of an ancient camp, which is supposed to be British.

At Sheparton, upon the banks of the Thames, south-east of Stanes, is a piece of inclosed ground, called Warre Clofe, in which spurs, swords, human bones, and other remains of antiquity, have been dug up; and on the west of Warre Clofe, part of a Roman camp is still visible.

Near King's Arbour, north-east of Stanes, is a Roman camp, consisting of a single work, and not large; and at about the distance of a mile from this, is another Roman camp.

MEMBERS of PARLIAMENT for this COUNTY.

Middlesex sends eight members to parliament, two knights of the shire for the county, four representatives for the city of London, and two for the city of Westminster. The borough of Southwark also sends two members; but these, though the Borough is one of the divisions of London, are reckoned among the representatives for the county of Surry.

S U R R Y.

THE county of Surry is bounded on the north by the Thames, which separates it from Middlesex; on the south by Suffex; on the east by Kent; and on the west by Berkshire and Hampshire. Its form is nearly that of a long square or parallelogram, extending thirty-four miles in length from east to west, and twenty-one in breadth from north to south. It is about one hundred and twelve miles in circumference, containing in that space seven hundred and thirty-five square miles, or about five hundred and ninety-two thousand acres; thirteen hundreds, one hundred and forty parishes, eleven market-towns, thirty-five vicarages, five hundred and fifty villages and hamlets, and about one hundred and seventy-one thousand inhabitants. It lies in the province of Canterbury, and diocese of Winchester.

R I V E R S.

This county is watered by the Thames, the Mole, the Wey, and the Wandle.

The Thames will be described in our account of Berkshire, and other counties through which it flows. The tide of this famous river runs up considerably above Richmond, a celebrated village in Surry, twelve miles from London, and about sixty from the sea, which is a greater distance than the tide flows up any other river in Europe.

The Mole rises near Okely, south-west of Darking; and running eastward for several miles, along the borders of Suffex, forms an angle, and directs its course north-west, in which direction it continues its course to the foot of Box-hill, where the stream disappears by little and little at different places called the Swallows, probably from the water being swallowed up by these subterranean aqueducts. From this circumstance the river itself is also called the Swallow; and it appears to have derived the name Mole from working its way under ground, it being the general opinion, that from the bottom of Box-hill, where it is swallowed up, it works a passage for more than two miles, to Letherhead, where it is supposed to spring up anew; and from whence it continues its course northward till it falls into the Thames, over-against Hampton Court, in the county of Middlesex. Later writers, however, are persuaded, that the waters of the Mole are totally lost at the Swallows; and that the stream which rises at Letherhead, flows from a different spring, and is consequently a new river; though, from a belief of its being the same, it has obtained the same name.

The Wey rises in the neighbourhood of Alton, a market-town of Hampshire; and directing its course eastward, enters the county of Surry at Farnham; where forming an angle, it runs by Godalming and Guilford, the county town: from thence it continues its course to Woking, where turning to the north-east, it empties itself, by a double mouth, into the river Thames, about a mile from Chertsey.

The Wandle, or Vandal, rises at Carshalton, near Croydon; and running north with a small but clear stream, falls into the river Thames at Wandsworth, about four miles from London.

Remarks on the INLAND NAVIGATION of Surry.

The only piece of inland navigation in this county, except that of the Thames, is the river Wey, which is now navigable to Godalming, and its navigation of the greatest benefit to the south-east parts of Surry, by supplying the inhabitants with coals and other necessaries from London. This navigation might be easily extended to Farnham, a very considerable market-town

on the borders of Surry, and consequently increase the advantages the county already reaps from this stream. The navigation of this river formerly terminated at Guilford, from whence it has lately been extended to Godalming, and it is hoped will be farther continued, at a time when inland navigation so greatly engages the national attention.

AIR, SOIL, and NATURAL PRODUCTIONS.

The air and soil are vastly different in the middle and extreme parts of this county. Towards the borders of Surry, especially on the north side near the Thames, and on the south side in and near a vale called Holmsdale, stretching for several miles from Darking to the county of Kent, the air is mild and healthy, and the soil fruitful in corn and hay, with a fine mixture of woods and fields; but in the heart of the county, the air is bleak; and though there are some delightful spots, the tract consists chiefly of open and sandy ground, and barren heaths. In some places there are long ridges of hills or downs, which afford nothing but warrens for for rabbits and hares, and parks for deer. Hence the county has been compared to a coarse piece of cloth bordered with a fine and broad list. The air of Cotman Dean, near Darking, has been reputed the best in England. It is observed, that the inhabitants of the middle parts of Surry are generally of a pale complexion, resembling the natives of Picardy in France; and that even the cattle in that district are of a lighter colour than usual in other parts of England, which is attributed to the air and soil.

Surry produces great quantities of box-wood and walnut-tree; the meadows prodigious crops of excellent hay, and the arable lands very fine corn; while the downs, particularly those of Banstead, which stretch thirty miles in length, from Croydon to Farnham, being covered with a short sweet herbage, interspersed with thyme and other aromatic herbs, feed large flocks of sheep, the mutton of which, though small, is remarkably sweet. Near Rygate is a very plentiful vein of fuller's earth, which is sent to various parts of the kingdom. With regard to the hops produced in the neighbourhood of Farnham, we have mentioned them in our account of Hampshire.

Remarks on the HUSBANDRY of Surry.

In the neighbourhood of Guilford, there is much bad land, and the downs are poor. They sow a good deal of saint-foin, which is a great improvement, for it yields two loads, and sometimes two loads and a half per acre. Between that place and Ripley, the soil is something better, and lets in general from ten to fifteen shillings per acre. The course is, 1. fallow; 2. wheat; 3. barley; 4. clover; 5. wheat; 6. beans, pease, or oats. This course is however observed only where the soil is in good order; if it runs foul, they favour it more. They plough three or four times for wheat, sow two bushels and a half on an acre, and reckon three quarters a middling crop. For barley they plough only once in their light lands, but twice in those which are heavier; sow three or four bushels, and four quarters is the mean produce. For oats they plough but once, sow four or five bushels, and reap, at a medium, four or five quarters. When beans are the crop, they also plough but once, and dibble in three bushels to an acre; hoe them always once, and, if foul, twice. For pease one earth they think sufficient; sow three bushels, generally in drills fourteen or fifteen inches asunder, with a small plough made on purpose; always hoe them once, generally

generally twice, and have usually, on a medium, four quarters to an acre. They sow a great many turnips, plough twice or thrice for them, hoe them twice, and generally feed them off with sheep. Sometimes they feed their stabled bullocks with them, in which case they reckon that an acre of good turnips will be sufficient for fattening two beasts of a middling size.

They use both horses and oxen in their tillage; drive four horses to a plough, and sometimes more; and four, six, and eight oxen; and in their light lands turn up an acre and a half a day; but in stiffer soils, only an acre. The oxen are reckoned the most profitable, but ten horses to one ox are kept for husbandry in this county.

The price of labour in winter is one shilling and two-pence a day; in spring, one shilling and four-pence; in harvest, two shillings, and two shillings and six-pence. Reaping wheat, from five to nine shillings an acre. Mowing corn, from one shilling and two-pence to one shilling and six-pence. Mowing grass, two shillings, and two shillings and six-pence. Hoeing turnips, five shillings; a second time, four shillings. Hoeing beans or peas, three and four shillings. Ploughing, five or six shillings an acre.

From Cobham almost to Westminster-bridge, the soil is sandy, and naturally poor; but near London, greatly enriched with manure. The crops are, however, generally very good about Esher and Kingston, but there is nothing particular in the husbandry. Their course of crops is, 1. fallow; 2. wheat; 3. spring-corn, or clover. The price of labour in winter is one shilling and four-pence a day; in spring, two shillings; in harvest, two shillings and six-pence, with beer.

BOROUGHES, MARKET TOWNS, &c.

We entered Surry from Middlesex over Kew Bridge, in order to view the elegant palace and gardens belonging to her royal highness the princess dowager of Wales. The town of Kew is situated on the southern bank of the Thames, opposite Old Brentford; and has a chapel of ease, erected at the expence of the nobility and gentry, many of whom have elegant seats in the neighbourhood.

In the year 1758, an act was passed for building a bridge across the Thames opposite to Kew-green; and this act has for some time been carried into execution, a bridge of eleven arches having been erected across the river. The two piers, and their dependent arches on each side next the shore, are built of brick and stone; the intermediate arches, which are seven in number, are of wood. The span of the centre arch is fifty feet, and the width of the road over the bridge thirty.

The palace is a very elegant edifice, the apartments noble, and finely furnished; but the gardens are remarkable for their beauty. The great pagoda is the grandest edifice of this kind in England: it is erected on a base, which is a regular octagon, forty-nine feet in diameter. The superstructure is also a regular octagon, and consists of ten stories, which form the ten stories of the building; the lowest of these stories is twenty-six feet in diameter, exclusive of the porticoes which surround it, and eighteen feet high: the second is twenty-five feet diameter, and seventeen feet high; the rest diminish in diameter and height, in the same arithmetical proportion, to the ninth story, which is eighteen feet in diameter, and ten feet high; the tenth story is seventeen feet in diameter, and, with the covering, twenty feet high; the finishing at top is seventeen feet high; so that the height of the whole structure, from the base to the fleur-de-lis, is one hundred and sixty-three feet. Each story finishes with a projecting roof after the Chinese manner, and is covered with plates of varnished iron of different colours; each is also surrounded with a gallery enclosed with a rail; all the angles of the roofs are adorned with large dragons, being eighty in number, and covered with a kind of thin glass of various colours, which produces a splendid reflection. The whole ornament at the top is double gilt; the substance of the walls is hard brick; the outside well matched grey-stocks neatly laid, and with such care, that there is not the least crack in the whole structure. The stair-case is in

the centre; the prospects open as you advance in height; and from the top the view commands forty miles over a rich and variegated country.

Here is a very beautiful orangery; with several temples; &c. in the antique taste, particularly the temple of Eolus and Bellona; together with the house of Confucius, a mosque, &c. In the middle of the garden is a beautiful lake, covered with an amazing number of different sorts of birds. But what will principally engage the attention of the lovers of mechanics in these elegant gardens, is a curious engine for raising water to supply the above lake. It is the Archimedean screw, turned by horses. It was erected by the ingenious Mr. Smeaton in the year 1761. This engine supplies the lake and basons in the gardens with water; raising, by the assistance of two horses, upwards of three thousand six hundred hogheads of water in twelve hours.

Richmond, a village twelve miles from London. This is reckoned the finest village in the British dominions, and has therefore been termed the Frefcati of England. It was anciently the seat of our monarchs, and the palace, from its splendour, was called Shene, which in the Saxon tongue signifies bright or shining. Here king Edward III. died of grief for the loss of his heroic son Edward the Black Prince; and here died Anne, the wife of Richard II. who first taught the English women the use of the side-saddle, for before her time they used to ride astride. Richard, however, was so afflicted at her death, that it gave him such a dislike to the place where it happened, that he defaced the fine palace; but it was repaired and beautified afresh by king Henry V. who also founded near it three religious houses. In the year 1497, this palace was destroyed by fire, when king Henry VII. was there; but in 1501, that prince caused it to be new built, and commanded that the village should be called Richmond, he having borne the title of earl of Richmond before he obtained the crown by the defeat and death of Richard III. Henry VII. died here; and here also his grand-daughter, queen Elizabeth, breathed her last. On the ground where formerly stood a part of the old palace, the earl of Cholmondeley has a seat, as has also Mr. Wray.

The present palace, which is finely situated, is a very plain edifice, built by the duke of Ormond, who received a grant of a considerable space of land about Richmond, from king William III. as a reward for his military services; but it devolved to the crown on that duke's attainder, in the beginning of the reign of king George I. and this house was by his present majesty confirmed to the late queen Caroline, in case she became queen dowager of England.

His majesty took great delight here, and made several improvements in the palace, while her majesty amused herself at her royal dairy-house, Merlin's cave, the Hermitage, and the other improvements which she made in the park and gardens of this delightful retreat.

Though the palace is unsuitable to the dignity of a king of England, the gardens are extremely fine, without offering a violence to nature; and Pope's advice with respect to planting, may be considered as a very accurate description of the beauties to be found here.

To build, to plant, whatever you intend,
To rear the column, or the arch to bend;
To swell the terrace, or to sink the grot,
In all let Nature never be forgot:
Consult the genius of the place in all,
That tells the waters or to rise or fall;
Or helps th' ambitious hill the heav'ns to scale,
Or scoops in circling theatres the vale;
Calls in the country, catches op'ning glades,
Joins willing woods, and varies shades from shades;
Now breaks, or now directs th' intending lines;
Paints as you plant, and as you work, designs.

In short, almost every thing here has an agreeable wildness, and a pleasing irregularity, that cannot fail to charm all who are in love with nature, and afford a much higher and more lasting satisfaction than the stiff decorations of art, where the artist loses sight of nature, which alone ought to direct his hand.

On entering these rural walks, you are conducted to the dairy, a neat but low brick building, to which there is an ascent by a flight of steps; in the front is a handsome angular pediment. The walls on the inside are covered with stucco, and the house is furnished suitably to a royal dairy, the utensils for the milk being of the most beautiful china.

Passing by the side of a canal, and through a grove of trees, the temple presents itself to view, situated on a mount. It is a circular dome crowned with a ball, and supported by Tuscan columns, with a circular altar in the middle, and to this temple there is an ascent by very steep slopes.

Returning by the dairy, and crossing the gravel walk, which leads from the palace to the river, you come to a wood, which you enter by a walk terminated by the queen's pavilion, a neat elegant structure, wherein is seen a beautiful chimney-piece, taken from a design in the addition to Palladio, and a model of a palace intended to be built in this place.

In another part of the wood is the Duke's summer-house, which has a lofty arched entrance, and the roof rising to a point, is terminated by a ball.

On leaving the wood, you come to the summer-house on the terrace, a light small building with very large and lofty windows, to give a better view of the country, and particularly of that noble seat called Sion house. In this edifice are three good pictures, representing the taking of Vigo by the duke of Ormond.

Passing through a labyrinth, you see, near a pond, Merlin's cave, a Gothic building thatched; within which are the following figures in wax, Merlin, an ancient British enchanter; the excellent and learned queen Elizabeth, and a queen of the Amazons. Here is also a library, consisting of a well chosen collection of the works of modern authors, neatly bound in vellum.

On leaving this edifice, which has an antique and venerable appearance, you come to a large oval of above five hundred feet in diameter, called the Forest oval; and turning from hence, you have a view of the Hermitage, a grotesque building, which seems as if it had stood many hundred years, though it was built by order of her late majesty. It has three arched doors, and the middle part, which projects forward, is adorned with a kind of ruinous angular pediment: the stones of the whole edifice appear as if rudely laid together, and the venerable look of the whole is improved by the thickness of the solemn grove behind, and the little turret on the top with a bell, to which you may ascend by a winding walk. The inside is in the form of an octagon with niches, in which are the busts of the following truly great men, who by their writings were an honour not only to their country, but to human nature. The first on the right hand is the incomparable Sir Isaac Newton, and next to him the justly celebrated Mr. John Locke. The first on the left hand is Mr. Woolaston, the author of *The Religion of Nature displayed*; next to him is the reverend and learned Dr. Samuel Clarke, and in a kind of alcove is the truly honourable Mr. Robert Boyle.

Leaving this seat of contemplation, you pass through fields clothed with grass; through corn fields, and a wild ground interspersed with broom and furze, which afford excellent shelter for hares and pheasants, and here there are great numbers of the latter very tame. From this pleasing variety, in which nature appears in all her forms of cultivation and barren wildness, you come to an amphitheatre formed by young elms, and a diagonal wilderness, through which you pass to the forest walk, which extends about half a mile, and then passing through a small wilderness, you leave the gardens.

At the extremity of the garden on the north-east, is another house that belonged to her majesty, and near it the house of his late royal highness Frederick prince of Wales, which is on the inside adorned with stucco. Opposite the prince's house is the princess Amelia's, built by a Dutch architect, the outside of which is painted.

To the west of the gardens are seen the fine houses of several of the nobility and gentry, particularly the lady

Buckworth's, and Mr. Geoffrey's; and extending the view across the Thames, there appears Isleworth.

But to return to the village of Richmond. The Green is extremely pleasant, it being levelled and inclosed in a handsome manner; it is also surrounded with lofty elms, and adorned on each side with the houses of persons of distinction. A sun-dial is here affixed in a pretty taste, encompassed with seats: this, and the railing in of the Green, were at the sole charge of her late majesty.

Among the pretty seats on this spacious Green, is a handsome edifice that formerly belonged to Sir Charles Hedges, and since to Sir Matthew Decker, in the gardens of which is said to be the longest and highest hedge of holly that was ever seen, with several other hedges of evergreens; there are here also vistas cut through woods, grottos, fountains, a fine canal, a decoy, summer-house and stove-houses, in which the anana, or pine-apple, was first brought to maturity in this kingdom.

On the north-east side of the Green is a fine house, which belonged to the late Mr. Heydigger, and a little beyond it, that of the duke of Cumberland: passing by which, you come to a small park belonging to his majesty, well stocked with deer; and opposite to it is the entrance into the gardens.

The town runs up the hill above a mile from the village of East Shene, to the New Park, with the royal gardens sloping all the way towards the Thames, whose tide reaches to this village, though it is sixty miles from the sea; which is a greater distance than the tide is carried by any other river in Europe.

On the ascent of the hill are wells of a purging mineral water, frequented during the summer by a great deal of good company. On the top there is a most extensive and beautiful prospect of the country, interspersed with villages and inclosures; the Thames is seen running beneath, and the landscape is improved by the many fine seats that are scattered along its banks.

There is here an alms-house built by Dr. Duppa, bishop of Winchester in the reign of king Charles II. for the support of ten poor widows, pursuant to a vow made by that prelate during that prince's exile. There is another alms-house, endowed with above one hundred pounds a year, which, since its foundation, has been considerably increased by John Mitchell, Esq. Here are also two charity-schools, one for fifty boys, and the other for fifty girls.

New Park, in Surry, is situated between Kingston and Richmond. This is one of the best parks in England; it was made in the reign of king Charles I. and inclosed with a brick wall, said to be eleven miles in compass. In this park there is a little hill cast up, called King Henry's Mount, from which is a prospect of six counties, with a distant view of the city of London, and of Windsor Castle.

The new lodge in this park, built by the late Sir Robert Walpole, earl of Orford, is a very elegant edifice. It is built of stone in a square form, with wings on each side of brick. It stands on a rising ground, and commands a very good prospect of the park, especially of that fine piece of water which is in it, and which might be enlarged and brought across the vista which is in the front of the house, through a wood. This park is the largest of any within the environs of London, except that of Windsor, and the finest too; for though it has little more than a wild variety of natural beauties to shew, yet these are such as cannot fail to please those who are as much delighted with views in their rudest appearance, as in all the elegance of art and design.

Having viewed every thing curious at Richmond, we passed along the bank of the Thames to Petersham, a village near the New Park, and a little to the south of Richmond Hill. Here once stood a delightful seat built by the earl of Rochester, lord high treasurer in the reign of king James II. This fine house was burnt down in the year 1720, in so sudden a manner, that the family, who were then all at home, had scarcely time to save their lives. Nor was the house, though furnished in the most exquisite manner, both within and without, the greatest loss sustained: the noble furniture, the curious collection of paintings, and the inestimable library of the

the first earl of Clarendon, lord high chancellor of England, and author of the History of the Rebellion, were wholly consumed; and, among other valuable pieces, several manuscripts relating to those times, and to the transactions in which the king his master, and himself, were engaged both at home and abroad: besides other curious collections made by that noble author in foreign countries.

On the ground where once this noble house stood, the earl of Harrington erected another seat after a design of the earl of Burlington. The front next the court is very plain, and the entrance to the house not very extraordinary: but the south front next the garden is bold and regular, and the apartments on that side, chiefly designed for state, are extremely elegant.

The gardens were before crowded with plantations near the house, but are now laid open in lawns of grass. The kitchen garden, before situated on the east side of the house, is removed out of sight, and the ground converted to an open slope of grass, leading up to a terrace of great length, from which is a prospect of the river Thames, the town of Twickenham, and of all the fine seats in that part of the country. On the other side of the terrace is a plantation on a rising ground; and on the summit of the hill a fine pleasure-house, which on every side commands a prospect of the country for many miles.

From this delightful village we continued our tour to Kingston upon Thames. The prospects on each side are truly admirable, and perhaps can hardly be equalled. The villages are so full of beautiful buildings, charming gardens, and delightful retreats, that it is impossible to view these countries from a rising ground, and not be ravished with the enchanting scene.

Kingston upon Thames is so called from its having been the residence of several of our Saxon kings, some of whom were crowned on a stage erected in the market-place. It is a populous and well built place, twelve miles from London, and in the reigns of Edward II. and III. sent members to parliament. The church is spacious, and decorated with the pictures of the Saxon kings who were crowned here; together with that of king John, who gave the inhabitants their first charter. Here is also a wooden bridge of twenty arches over the Thames; a free-school erected and endowed by queen Elizabeth; and a charity-school for thirty boys, who are all clothed. The summer assizes for the county of Surry are generally held here; and on the top of the hill is a gallery, which overlooks the town. A house near this town, now called Hircomb's Place, was once the seat of the famous earl of Warwick, stiled the Setter up and the Puller down, of Kings. Besides the bridge already mentioned, here is another of brick over a stream that flows from a spring about four miles above the town, and which, within the distance of a bow-shot from its source, forms a brook sufficient to drive two mills. The market in this town is very considerable for corn, and the trade to London, &c. pretty large.

Here is a market on Saturday, and three annual fairs, viz. Thursday, Friday, and Saturday, in Whitsun-week, for horses and toys; the second, third, and fourth of August, for fruit and pedlars ware; and the fifteenth of November, for horses, cattle, and toys.

From Kingston we passed on to Weybridge, a village about four miles south-west of Hampton Court, and which owes its name to a bridge formerly erected here over the river Weye. In the neighbourhood of this village are several fine seats, particularly those of the earls of Portmore and Lincoln. The latter is called Outlands: the other, which is known by the name of Ham Farm, is a very handsome structure, regularly built of brick, with a fine lawn before the garden front. The grounds about it consist of about five hundred acres, one hundred and thirty of which are laid out for pleasure, besides a paddock of about sixty acres. This delightful seat has the command of two navigable rivers, the Thames, which comes with a fine bending course by the side of the terrace; and the Weye, which runs directly through the grounds, and joins the Thames at the terrace. There is a swing bridge over the Weye,

which may be turned aside at pleasure, to let boats and other vessels pass. The Weye is navigable up to Guildford, and thence is now extended to Godalmin. What is called the Virginia water, runs from Windsor great park, and flows a little higher up through the grounds of the late Mr. Southcote. The terrace next the Thames is remarkably beautiful; and though it lies on a flat, there are some good views from it, as well as from some other parts of the garden.

Leaving the delightful prospects of Ham Farm, we crossed the country, in order to visit Claremont, the seat of the late duke of Newcastle at Esher, now belonging to lord Clive. The house was designed and built by the late Sir John Vanbrugh, in a whimsical style of architecture. It was afterwards purchased of Sir John by his Grace, who has been at great expence in improving the place. The structure, though singular, does not appear to be irregular. It is built of brick, with a good deal of variety in it; and of considerable extent, but not much elevated. The duke has since built a grand room for the reception of company, when numerous, which makes the ends of the house not appear similar. The house has a lawn in the front, shaded on each side with trees, and the ground behind it rising gradually, shews the trees there also, so that the house appears to be embowered by them, except just in the front; and the white summer-house, with four little pinnacles, one at each corner, built on the mount which gives name to the place, when viewed from before the front of the house, rises up finely from behind the trees, and altogether forms a very pleasing appearance. The park in which it is situated is distinguished by its noble woods, lawns, walks, mounts, prospects, &c. The summer-house, called the Belvedere, at about a mile's distance from the house, on that side of the park next Esher, affords a very beautiful and extensive view of the country quite round; yet that from the summer-house at Esher-place, which is just by, is perhaps no way inferior to it.

Near this seat is Esher-place, once the seat of the late Henry Pelham, Esq. The house is a Gothic structure, built of a brownish red brick, with stone facings to the doors, windows, &c. It stands upon almost the lowest ground belonging to it, and has the river Mole gliding close by it, and through the grounds. This house was originally one of those built by Cardinal Wolsey; but the late Mr. Pelham rebuilt the whole, except the two towers in the body of the house, which are the same that belonged to the old building; and the whole is rebuilt in the same stile of architecture it was before, which uniformity is certainly better than an unnatural mixture of Gothic and modern too often practised. There is a fine summer-house built upon a hill on the left hand as you enter, which commands the view of the house, park, and country round on both sides of the Thames for many miles. The park or ground in which the house is situated, appears quite plain and unadorned; yet perhaps not a little art has been used to give it this natural and simple appearance, which is certainly very pleasing. But in one part of it there is a pretty wilderness laid out in walks, and planted with a variety of ever-green trees and plants, with a grotto in it, and seats in different places. The wood in the park is well disposed, and consists of fine oak, elm, and other trees; and the whole country round appears finely shaded with wood.

The grand floor of the house is elegantly finished, and consists of six rooms. The great parlour is carved and gilt in a taste suitable to the stile of the house, with curious marble chimney-pieces and slabs. In this room are the portraits of Mr. Pelham, Sir Robert Walpole, afterwards earl of Orford, lord Townshend, duke of Rutland, the late duke of Devonshire, and the late duke of Grafton; a picture of lady Catharine Pelham and her son is over the chimney. In the drawing-room, over the chimney, there is a picture of king Charles II. when only eleven years old, by Vandyke. The library is curiously finished, and there is a good collection of books in it. Some say it was at this house Cardinal Wolsey was first seized by order of Henry VIII. on

his refusing to annul his marriage with queen Catharine, that he might marry Ann Boleyn, and which refusal brought on his fall.

The next place that engaged our attention was an handsome house belonging to general Conway at Byfleet, in the neighbourhood of Cobham; near which the late reverend and ingenious Mr. Spence made neat improvements to a small place, which shew what can be performed at a little expence, by a man of taste and genius.

The river Mole, which rises near Dorking, passes along by the side of this park, and in its course serpentinizes about in so beautiful a manner, that you frequently lose the sight of it; and, by its windings, makes the course almost four miles within the compass of this inclosure. Indeed this river is very narrow, and in dry weather the current is exceeding slow, and the water not well coloured, which, it must be allowed, takes off from its beauty; yet there is room for great improvements, by sloping off the banks, so as to have a better view of the water; and in many places, by taking away some of the little projections of the banks, it may be widened, so as to appear considerable at some distance; which, if done, will add much to the beauty of the place.

Near Cobham is also the house of Mr. Bridges, which is built in a very singular taste, something after the model of an Italian villa, but very plain on the outside. The apartments within seem very commodious, and the principal rooms are elegantly fitted up, the ceiling being gilt, and all the members are richly ornamented: the offices below are very convenient, and judiciously contrived to answer the purposes for which they were designed. But what chiefly strikes the beholder's eye, is a false story contrived on each side of the house, taken from the difference in the height of the side-rooms from those principal apartments; and these are converted into long galleries, with a small apartment at one end, which affords a communication between them. In the Attic story there are very good lodging-rooms, which are well laid together; so that for the size of this house, there is hardly any other near London, which has more useful and elegant apartments.

The situation of the house is on an eminence, so that it commands the prospect of the adjacent fields, which are kept in very exact order; and there is a declivity from the house to the river Mole, which passes along by the side of this gentleman's garden; and here it appears much more considerable than in any other part of its course, for Mr. Bridges has taken away so much of the earth of the banks, as to make the river, in some places, four or five times broader than it was naturally, so that at present it makes an handsome appearance. By the side of the water he has disposed the earth into a natural slope, with a broad grass walk, planted with sweet shrubs on each side; and at the end of the walk is a fine room, which has a view of the water lengthwise, and is a delightful retreat in hot weather, being shaded by large elm trees on the south side, and having the water on the north and east sides, which render it at once pleasingly cool and delightfully pleasant. This house is situated about a mile from the road to Portsmouth, and so much hid by the trees near it, as not to be seen till the spectator rises on the heath beyond Cobham, where, in several parts of the road between that and Ripley, are fine views of it.

In this neighbourhood is also the elegant seat, and ornamented park of ——— Hamilton, Esq; the latter of which is exceeded by few in England.

Passing from the house, and a few winding shrubberies, which are parted from the park by net-work, and in which the Green-house is situated, we were conducted through the park to another inclosed plantation, which has an agreeable walk, commanding a pretty valley, through a winding row of fir-trees, and at the summit of a bank, which is planted with vines, the produce of which, last vintage, was three half hogheads of wine. This walk leads to the Gothic temple, an open building, which looks immediately upon a large piece of water, with a handsome bridge thrown over an

arm of it. As the temple is upon a rising ground, and looks down upon the water, the beauty of the scene is greatly increased. In point of lightness, few buildings exceed this temple. From thence we wind through a fresh walk, near another part of the water, cross a bridge, formed, to appearance, of rocks and fossils; and turning down to the right, find that this bridge is the covering of a most beautiful grotto, as well as the water; for immediately under it is a large incrustation of fossils, and spar hanging every where like icicles from the ceiling, has a most pleasing effect. On each side the water is a small path, parted from the stream by marine fossils: nothing can have a more elegant effect than the ceiling of this grotto, (in which is stuck, with great taste, a profusion of spar) hanging over the water, as if of a kindred, but congealed nature. From this grotto the walk leads, on the side of the water, to a ruined arch, in a just taste: the tessellated pavement, the mosaic'd ceiling, and the basso and alto relievos, which are let into the wall, are all in an exceeding good taste, in decay; the symptoms of which are excellently imitated, with weeds growing from the ruined parts, and all the other marks of antiquity. Through the arch, the river appears winding in a proper manner; that is, dark and gloomy, around a rough piece of grass, which has a consistent appearance. But what hurt us very much, was the contradiction of emotions raised by the scene behind, which was totally different from that of the ruin; elegant and agreeable, a smooth water, and sloping banks, closely shaven, with a little island in it, are all agreeable objects, and by no means affect the spectator in unison with the ruin of Grecian architecture, and the gloomy objects around.

The cascade, which is the next object that appears, is, though trifling, in a very just taste. The water gushes in five or six streams, out of tufts of weeds growing in the rock; over it bends the trunk of an old oak, from side to side, which has an exceeding good effect; and the trees rising to a great height above all, finish the scene very completely. This cascade is fed by a wheel, which lifts the water from the river, which falling in the cascade, keeps up the lake already mentioned. From hence we proceeded through a piece of wild ground, over-run with brakes and rubbish, through a scoop or hollow, bounded by high firs on each side; and in which the tower (another ornamental building) appears with a very pleasing effect, to other darker walks, quite closed, which lead to the hermitage. We entered into a small room, nearly dark; and on the opening of a door out of it, into the hermit's parlour, (another room) the windows at once present a very beautiful scene; for you look immediately down upon the river, winding round some cultivated fields, with a very good prospect bounding the whole. But the river is too narrow, and not seen distinctly enough: the wood which grows on its banks, and the beaks under the hermitage window, almost hide it; nor are the fields overlooked half so distinct and beautiful as those in some other parts; but notwithstanding this comparison, the view appears exceedingly beautiful: the coming upon it, by suddenly opening the door between the hermit's rooms, is contrived with the utmost taste.

The tower is the next building. From it is seen a very fine prospect; St. Paul's cathedral and Windsor castle being two, among many other objects: but the temple of Bacchus, which we came to next, is infinitely beyond it. It consists of one handsome room elegantly stucco'd, with a portico of Corinthian pillars, in a light and beautiful taste. In niches, under the portico, are four copies in plaister, from celebrated statues; the Venus de Medicis, and Venus with fine haunches, making two, and both good. Around the room are antique Roman statues, on handsome pedestals, and in the middle a colossal one of Bacchus. From hence another winding walk leads you out of the park.

The village of Cobham itself is but small, though it has some good inns, being situated on the Portsmouth road; and has two annual fairs, on the seventeenth of March, for toys; and the eleventh of December, for horses and sheep.

Leaving the neighbourhood of Cobham, we passed to Leatherhead, or Letherhead, a small town, situated about four miles to the south-west of Epsom. It had formerly a market, which has been discontinued above an hundred years. Here is a bridge over the river Mole, which having sunk into the earth near Mickleham, at the foot of Box-hill, rises again near this town, and runs through Cobham, to the Thames at Moulsey. 'Tis pleasantly situated on a rising bank by the side of the river, and in as good a situation for riding or hunting as most within twenty miles of London, it having a fine, open, dry champaign country, almost all round it.

Not far from Leatherhead is Leith-hill, admired for affording one of the noblest prospects in all Europe, of which Mr. Dennis gives a lively description in his Letters familiar, moral and critical; we shall therefore transcribe his words. "In a late journey (says he) which I took into the Wild of Suffex, I passed over an hill which shewed me a more transporting sight than ever the country had shewn me before, either in England or Italy. The prospects which in Italy pleased me most, were that of the Valdarno from the Apennines; that of Rome, and the Mediterranean from the mountains of Viterbo; of Rome at forty, and the Mediterranean at fifty miles distance from it; and that of the Campaigne of Rome from Tivoli and Frescati; from which two places you see every foot of that famous Campaigne, even from the bottom of Tivoli and Frescati to the very foot of the mountain of Viterbo, without any thing to intercept your sight. But from an hill which I passed in my late journey into Suffex, I had a prospect more extensive than any of these, and which surpassed them at once in rural charms, in pomp, and in magnificence. The hill which I speak of, is called Leith Hill, and is about five miles southward from Darking, about six from Box-hill, and near twelve from Epsom. It juts itself out about two miles beyond that range of hills which terminate the north downs to the south. When I saw from one of these hills, at about two miles distance, that side of Leith Hill which faces the northern downs, it appeared the beautifullest prospect I had ever seen: but after we had conquered the hill itself, I saw a sight that would transport a stoic; a sight that looked like enchantment and vision. Beneath us lay open to our view all the wilds of Surry and Suffex, and a great part of that of Kent, admirably diversified in every part of them with woods, and fields of corn and pastures, every where adorned with stately rows of trees.

"This beautiful vale is about thirty miles in breadth, and about sixty in length, and is terminated to the south by the majestic range of the southern hills, and the sea: and it is no easy matter to decide, whether these hills, which appear at thirty, forty, fifty miles distance, with their tops in the sky, seem more awful and venerable, or the delicious vale between you and them more inviting. About noon, in a serene day, you may, at thirty miles distance, see the very water of the sea through a chasm of the mountains. And that which above all makes it a noble and a wonderful prospect, is, that at the same time that, at thirty miles distance, you behold the very water of the sea; at the same time that you behold to the south, the most delicious rural prospect in the world; at that very time, by a little turn of your head towards the north, you look full over Box-hill, and see the country beyond it, between that and London; and, over the very stomacher of it, see St. Paul's at twenty-five miles distance, and London beneath it, and Highgate and Hampstead beyond it."

Near this is Box-hill, which owes its name to a great number of box-trees planted on the south side of it by the earl of Arundel, in the reign of Charles I. but the north side is covered with yew. On the summit is a large warden, from whence there is a very fine prospect.

The next place we visited was Epsom, a well-built and handsome town, sixteen miles from London. It abounds with very genteel houses, which are principally the retreats of the merchants and citizens of London,

and is a delightful place, open to Bansted Downs. Its mineral waters, which issue from a rising ground nearer Ashsted than Epsom, were discovered in 1618, and soon became extremely famous; but though they are not impaired in virtue, they are far from being in the same repute as formerly. However, the salt made of them is valued all over Europe. The hall, galleries, and other public apartments, are now gone to decay, and there remains only one house on the spot, which is inhabited by a countryman and his wife, who carry the waters in bottles to the adjacent places. Horse-races are annually held on the neighbouring downs. The town extends about a mile and a half in a semicircle, from the church to lord Guildford's fine seat at Durdans; and, as Mr. Whatley observes, there are here so many fields, meadows, orchards, and gardens, that a stranger would be at a loss to know whether this was a town in a wood, or a wood in a town. There are many fine seats in this neighbourhood, besides Durdans, already mentioned, as lord Baltimore's, the lady Fielding's, earl of Berkshire's, &c.

Leaving the town of Epsom, we followed the Portsmouth road to Guildford, a considerable borough-town seated on the river Wey, thirty miles from London. It was an ancient Saxon town, and given with Godalming by king Alfred to his nephew Ethelwald. It is famous among the historians for the treachery and barbarity of Godwin earl of Kent, who, in 1036, received, with assurances of fidelity, Alfred, the son of king Ethelred, that came out of Normandy with six hundred attendants to claim the crown of England, to which he was heir. The earl, in the night, fell upon the young prince and his attendants, decimated them, by killing nine out of ten, rededicated the survivors, and delivered Alfred to Harold the Dane, who put out his eyes, and imprisoned him for life. It appears by Doomsday-book, that the king had here seventy-five hagæ, in which lived one hundred and seventy-five men. Here was a royal palace, frequented by many kings since the Conquest. The castle is of considerable antiquity, and was, together with Farnham-castle, taken in 1216 by Lewis, eldest son of the French king, in three days. James I. in 1611, granted the site and remains, containing five acres and three roods, to Francis Carter. Henry II. in 1172, respited the payment of a debt due from the inhabitants of six shillings and eight-pence, because of their poverty. Henry III. in 1256, gave them a charter, by which the itinerant judges were ordered to hold the assizes here always. Puiely-hill, under which the town stands, contains lands held by Thomas de la Puille in 1254, by the service of maintaining the meretines, or laundresses, of the king's court. The sum of fifteen pounds and odd was assessed in 1353, for a tenth to the king, to be paid proportionably by the laymen of this place. There were also three parish churches, two of which were given to the priory of Merton by William Testard; but one of them fell down in the year 1740.

It is governed by a mayor, recorder, and aldermen. The assizes are sometimes held here; and always the election for members of parliament, the town itself returning two. Here were formerly two or three convents, one of which was not long ago the seat of Daniel Coswall, Esq; and had a delightful park adjoining to it. Here is a charity-school, founded by king Edward VI. and an alms-house founded by George Abbot, archbishop of Canterbury, who endowed it with lands worth three hundred pounds a year, one hundred of which he ordered to be employed in setting the poor to work, and the other two hundred pounds he allotted for the maintenance of a master, twelve brethren, and eight sisters, who are to have two shillings and six-pence a week. The archbishop's birth-day is annually commemorated in it; and the archbishop of Canterbury is its visitor. There are here likewise two charity-schools for thirty boys, and twenty girls; and a fine circular course for horse-races, which begin when the Newmarket races are ended. Guildford had formerly a considerable manufacture of cloth, of which there are still some remains. The great road from Chichester and Portsmouth lies

through this town, which has been always famous for good inns, the cleanest of linen, and other excellent accommodations; and as the river Wey is made navigable to this town, a great quantity of timber is carried down it to London, not only from this neighbourhood, but from the Suffex and Hampshire woods, above thirty miles off, from whence it is brought to Guildford in summer by land-carriage.

Here is a market on Saturday, and two annual fairs, viz. the fourth of May, and the twenty-second of November, for horses, sheep, and hogs.

The road from thence to Farnham is very remarkable, for it runs along the ridge of a high chalky hill, no wider than the road itself, and the declivity begins on either hand, at the edge that bounds the highway, and is very steep and high. From this hill is a surprising prospect; to the north and north-west over Bagshot-heath; to the south-east into Suffex, almost to the South-downs; and to the west it is so unbounded, that the view is only terminated by the horizon. On this hill, which is called St. Catharine's, stands the gallows, in such a position, that the inhabitants of Guildford may, from the High-street, sit at their shop-doors, and see the criminals executed.

The next place we visited was Farnham, a large populous market-town, the farthest that way in the county of Surry, from London. Farnham was some years since noted for its corn-market, and at present for the quantity of hops it produces; and in the cultivation of which it has so vastly improved, that it is nearly equal to Canterbury, Maidstone, and any of the places in Kent most famous for that commodity, and this not only in quantity, but goodness. In short, all the neighbourhood about Farnham is one general hop-ground; and to shew the excellency of the product, Farnham hops now lead the price at all markets in England.

In this town is a castle built by a bishop of Winchester, which has been in constant succession possessed by the bishops of that diocese, ever since king Stephen's time to this day, and is their usual place of residence. This palace is a magnificent structure, deeply moated, and strongly walled, with towers at proper distances. It stands upon the edge of a hill, where is a fine park. One large and broad street of the town, at the foot of the hill, fronts the castle. The rest of the town consists of a long straight street, crossing it at right angles. The river runs parallel to it on the south.

Here is a weekly market on Thursday, and three annual fairs, viz. Holy Thursday, the twenty-fourth of June, and the second of November, for horses, black cattle, sheep and hogs.

About two miles from Farnham is More-park, formerly the seat of Sir William Temple, who, by his will, ordered his heart to be put into a china basin, and buried under a sun-dial in his garden, which was accordingly performed. This house is situated in a valley, surrounded on every side with hills, having a running stream through the gardens, which, with a small expence, might be made to serpentine through all the adjacent meadows, in a most delightful manner. Going from this seat, on the left hand, under a high cliff, is a noted kind of natural grotto, which they call Mother-Ludlam's-hole, through which runs a fine and strong rill of water. The grotto is very large, but diminishes and winds away as the spring seems to have directed it. The owner has paved the bottom of it with a kind of mosaic tile, and has separated the wider part from the narrow behind, by a little parapet, through which issues the flow of water, which trills through marble troughs, one below another, till it is conveyed out of the grotto; and there murmuring down a considerable declivity, over many artificial steps, falls into the river on the right hand; all which gives a very delightful entertainment to such as chuse in warm weather to make little collations or visits, there being fettees, with arms, for their conveniency.

From this grotto you command a fine prospect of the meadows and woods which lie below it, and over-against it; and these are bounded again by hills, which makes the whole one of the most romantic situations imaginable.

About a mile from the above described grotto, is the seat lately possessed by Mr. Child, which wants not its modern beauties any more than its ancient ones; for it is built on the site of Waverley-abbey, a little monastery for Cistercian monks, erected by William Giffard, bishop of Winchester; the kitchen of which, and other parts of its ruins, are still seen pretty entire, and were a few years ago much more so, before it fell into the hands of a farmer, who used to load his teams with the ruins to mend the roads, and for other private purposes.

The other places of note in this county, are, Blechingley, twenty miles from London. It is a small, ancient, parliamentary borough by prescription. It had a castle, which, with the manor, is or was some years since in possession of the family of Sir William Clayton. The bailiff, who returns its members, is chosen annually at the lord of the manor's court. The town stands on a hill, on the side of Holmsdale, with a fine prospect as far as the South-downs, and Suffex; and from some ruins of its castle, which are still visible, though overgrown with a coppice, there is a prospect east into Kent, and west into Hampshire. Here is an alms-house for ten poor people, and a free-school for twenty poor children. It has a handsome church, which had a spire, but in 1606 it was consumed by lightning, and all the bells melted.

This place sends two members to parliament, though it has no weekly market. Here are two annual fairs, viz. the twenty-second of June, and the second of November, for horses, bullocks, and toys.

Ryegate, or Rhiegate, which signifies the channel of a river, twenty-four miles from London. 'Tis an ancient borough by prescription, like the former, and its constitution the same. It stands in the vale of Holmsdale, with hills on each side, where is great variety of soil, stone, sand and chalk, abundance of fuller's earth, and no less variety of medicinal plants and herbs, and the vale abounds with Holm-trees. The inhabitants, because they once or twice defeated the plundering Danes, boast in this rhyme,

That the valley of Holmsdale
Was never won, nor ever shall.

Its weekly market was procured, by charter, from Edward II. its monthly one from king Charles II. and its market-house was formerly a chapel dedicated to Thomas Beckett. It has sent members to parliament from the first. King Charles II. at his restoration, granted the manor and castle to his brother the duke of York; and, at the Revolution, king William granted them to lord Somers; upon whose death, it came to James Cocks, Esq; then one of its burgeses in parliament. The ruins of its castle, which was built in the time of the Saxons, are still to be seen, particularly a long vault, with a room at the end of it, where, 'tis said, the barons, who took arms against king John, had their private meetings, it being large enough to hold five hundred persons. Its church is built of free-stone; and, in a vault under its chancel, are many monuments of the family of Howards, earls of Nottingham, and lords Effingham. This place gives title of baron to the earl of Peterborough. Under the hill adjoining to it, on the south side, is a great house, formerly a priory of black canons, and lately in the possession of Mr. Parsons, the grandson of Sir John, the lord mayor of London, who bought it. In this parish also is a fine seat, called Flankford, with a spacious garden, a deer-park, containing four ponds, and the river Mole runs on the south side of it. It belonged some years since to Sir Cyril Wyche, who was secretary of state for Ireland.

This town sends two members to parliament, has a weekly market on Tuesday, and two annual fairs, viz. Whitsun Monday, and the fourteenth of September, for bullocks and horses.

Gatton, eighteen miles from London, under the side of a hill going to Ryegate, is a borough by prescription, and was formerly a large town, but now a mean village, with a small church, and without fair or market; yet, ever since the twenty-ninth of Henry VI. has sent members to parliament, that are returned by its constable,

who

who is chosen annually at the court of Mr. Newland, the lord of the manor. 'Tis supposed to have been known to the Romans, by reason of their coins, and other antiquities that have been discovered here; and where the manor-house stands, 'tis said there was once a castle. This place sends two members to parliament.

Hastmere, in the lordship of Godalming, on the borders of Suffex, forty-one miles from London. Some will have it, that it was destroyed by the Danes, and had once seven parish churches, though it has now but one, and that only a chapel of ease to the mother-church of Chidlingfold. There is also a notion, that formerly the town stood upon a hill more to the south, which the frequent discovery of many walls thereabouts renders not improbable. This is also an ancient borough by prescription, consisting of a bailiff and burgettēers, who have sent members to parliament ever since the reign of Edward IV. It stands at the entry of a rich valley, extending to the South-downs, and covered with timber.

This place sends two members to parliament, has a weekly market on Tuesday, and two annual fairs, viz. the first of May, and the twenty-fifth of September, for horses, black cattle, sheep and hogs.

Battersea lies pleasantly on the Thames, four miles from London, with very pretty seats along the river, but is of no other note, except for giving title of baron to lord viscount St. John. Nor are Putney and Wimbledon, though they are both adorned with fine seats of the citizens of London, of any other note than for giving titles of peerage to Sir Edward Cecil, who was admiral, lord marshal, and general of the forces sent by king James I. and king Charles I. against the empire, and the Spaniards, whom king Charles created baron of Putney, and viscount Wimbledon.

Dulwich, on the borders of Kent, five miles from London, deserves particular mention for those called Sidnam Wells, which are resorted to in a morning by crowds of the lower class of people, in the proper season for purging; but more especially for its college or hospital, called, The College of God's Gift, consisting of two quadrangles, founded in 1619 by Mr. Alleyn, who, having been a player on the stage, and being appointed, with six others, to represent the devil, the latter was said to have appeared among them *propria persona*, and to have so frightened Mr. Alleyn, that he made a vow to erect this hospital, and accordingly signed the proper deeds. We are told, that afterwards he changed his mind, and would gladly have recalled his charity, but it was too late. He lived to be several years master of his said college, which he founded for a master and warden, who were to be always of his own name, and batchelors; and four fellows, (of whom three were to be divines, and the other an organist) six poor men, and as many poor women, with a school for the education of twelve poor boys. By his endowment he excluded all augmentations of it by future benefactions, and constituted the churchwardens of St. Giles's, Cripplegate, St. Botolph's, Bishopsgate, and St. Saviour's, Southwark, to be its visitors, who, in case of any difference, were to appeal to the archbishop of Canterbury, before whom all members were to be sworn. The founder himself lies in a fair chapel here, with his wife.

Stretham, six miles from London, which is about half way betwixt London and Croydon, is also famous for its medicinal springs, first discovered about the year 1660, has been for some years the lordship of the family of the Howlands, and gives title of baron to the duke of Bedford. Twelve girls are taught and clothed here upon charity.

Wandleworth, or Wanworth, six miles from London, a village between Putney and Battersea, is so called from the river Wandle, which runs into the Thames, under a bridge here, that is reckoned the sink of the county. This place is of note for a manufacture of brass plates and kettles, skillets and frying-pans. It has a charity-school for forty boys.

Here is an annual fair on Monday, Tuesday, and Wednesday, in Whitfun-week, for horses and toys.

Godalming, (vulgarly Godlimont, i. e. God's Alms) it being supposed to have been given by the lady Goda or Godiya, to some religious house, thirty-one miles from London. 'Tis a corporation, by whose charter, granted, as some say, by king Edward III. or, as others, by queen Elizabeth, their chief magistrate is a warden, chosen annually, who has eight brethren, his assistants. 'Tis the most eminent town in the county for making cloth, particularly mixed kerseys, and blue ones, (said to be the best coloured in the kingdom) for the Canaries. The parish is divided into nine tithings, of which one is Cateshall or Gatehill, a manor which was anciently held of the king by the master of his laundresses that followed the court. The town stands on the river Wey, which is now made navigable from hence to the Thames, abounds with good fish, especially pikes, and drives a grist-mill, two paper-mills, and three corn-mills. The best whitened brown paper is said to come from hence, and that this was the first place in the county that it was made in, the manufacture having been set up here in the reign of king James I. This place is also famous for liquorice, good carrots, and great store of peat, that burns as well or better than pit-coal.

'Tis said that, before the Conquest, this place was the see of a bishop, with a dean and canons; that the seat of the bishop was at Lothesley, now that of the Moors family; that the canons houses were in a street of this town, called Church-street; that the bishoprick was taken from it in the reign of Henry II. and the estates belonging to it conferred on the deanry of Sarum. Here is a charity-school for fifty boys.

Woking stands on the river Wey, twenty miles from London, half way betwixt Guildford and Weybridge, and gives name to its hundred. A neat market-house was built here in the year 1665, at the charge of James Zouch, Esq. Its first fair, which is but a small one, was procured by Edmund, duke of Somerset, from Henry VI. the other from king Charles II. by Mr. Zouch. 'Tis a private country town, out of any great road, so that 'tis little heard of; but there are the remains of the walls of a royal house, which was the residence of a branch of the family of Plantagenet, viz. the old countess of Richmond, mother to Henry VII. In the church-yard here it has been remarked, that so long as there is any thing left of a corpse, besides bones, a kind of plant grows from it, about the thickness of a bulrush, with a top like the head of asparagus, which comes near the surface, but never above it. The outside is black, but the inside red, and, when the corpse is quite consumed, the plant dies away. But the same observation has been made in other church-yards where the soil is a light red sand, as it is in this.

Bagshot, twenty-three miles from London, is famous for its mutton, though it must be noted, that the sheep killed by its butchers are generally brought from the downs of Hampshire. 'Twas formerly called Holy Hull, and the Lordship of our Kings, who have a house here, with a park, which was laid open after the civil wars: yet king James and king Charles I. often came to it, because of its convenient situation for hunting in the neighbourhood. This place is noted for good inns in the road betwixt Stanes and Hartley Row. The church, which is about half a mile from the road, was burnt down by lightning in 1676, but rebuilt by the parishioners in 1680. Bagshot-heath is a barren desert, with nothing but furze for a great many miles, extending a long way into Berkshire and Hampshire; yet by some inclosures lately made on the edge of it, and others in the centre, which produce good corn and grass, and plantations of trees, the soil is judged to be capable of improvement, though the whole tract of the country, from Egham to Farnham, for near eighteen miles, looks very much like one of the deserts of Westphalia.

Egham stands on the Thames, over-against Stanes, twenty miles from London, and has several as good inns as any town on the west road. Here is a great almshouse, built of brick, and endowed by baron Denham, surveyor of the works in the reign of Charles II. for the maintenance of five poor old women of this parish, who have each a different orchard, and were to have, by his will,

will, new gowns every Christmas, and stockings and shoes twice a year, but they were not to receive relief from the parish. John Denham the poet, (son to the former) who lived at that which is now the parsonage-house, took great delight in Prunewell-hill in this parish, and also in Cowper's-hill, the sweet prospect of which he has celebrated in one of the finest poems that ever appeared in our language. At Rumney-mead, on the north side of the town, called by our historians Running-mead, and sometimes Council-mead, which is now divided into inclosures, king John, frighted with the numerous army of barons who met him there, signed the great charter of the liberties of England, called Magna Charta; and the land is said to have been ever since exempted from tithe, on condition of paying three-pence an acre, and one penny dole. About the year 1706, the sum of six thousand pounds was bequeathed to this town, with which, besides several alms-houses, a charity school-house was built here, and endowed with forty pounds a year for teaching fifty poor boys to read, write, and cast accounts; and next year, another gentleman left fifty pounds a year for ever, to put out five poor boys of the parish apprentices.

Chertsey, nineteen miles from London, has a bridge over the Thames to Shepperton in Middlesex, and its principal trade is in malt, which it sends in barges to London. It gives name to a hundred which has the particular privilege of being exempted from the jurisdiction of the high sheriff, who must direct his writ to the bailiff of it, who is appointed for life by letters patent from the Exchequer. 'Tis noted for the burial-place of Henry VI. whose bones were afterwards removed by Henry VII. to Windsor; and for the retreat of the celebrated poet Mr. Cowley from court to the exercises of a country life, the happiness of which he has beautifully described in one of his poems; as he has, in another, the base fervility of a court life, and his hearty abhorrence of it, in that well known distich,

Were I to curse the man I hate,
Attendance and dependence be his fate.

Here is a market on Wednesday, and four annual fairs, viz. the first Monday in Lent, for horses, cattle, and hops; the fourteenth of May, the sixth of August, and the twenty-fifth of September, for horses, cattle, and toys.

At Coway-Stakes, near this place, Julius Cæsar passed the Thames. There is a handsome free-school here, built by Sir William Perkins. Its market was granted by king James I.

Croydon, anciently called Cradiden, is a large, pleasant, handsome town, ten miles from London, on the edge of Bansted downs, well supplied with all sorts of provisions, and the chief of the hundred to which it gives name. 'Tis said, that formerly our kings had a palace here, which, with the manor, was given to the archbishops of Canterbury; but, since archbishop Whitgift's time, it has been much neglected and decayed; and that in or about 1716, the dilapidations of it alone were valued at fourteen hundred pounds, and paid by the late archbishop Tennison's executors. Whitgift left a hospital here, which is a handsome building, in the form of a college, and endowed with farms, for the maintenance of a warden, and twenty-eight men and women, poor decayed housekeepers of this town and Lambeth; and a school for ten boys and ten girls, who are all clothed and taught, with a house for the master, (who must be a clergyman) endowed with twenty pounds a year for his salary. The church, which is the finest and largest in the county, stands by the palace, and has many remarkable monuments in it; particularly that of Dr. Grindall, whose effigies lies on his tomb in his episcopal robes; a prelate so studious, that his book was called his Bride, and his study his Bridechamber, for he therein spent his eye-sight, health, and strength. Another monument of archbishop Sheldon, reckoned one of the finest in England; and one for Mr. Tyrrel, a grocer of London, who gave two hundred pounds to build its market-house, besides forty pounds to beautify the church. Its market is chiefly for oats and oat-meal, for

London, though there is a great sale here, too, of wheat and barley. The town is encompassed with hills, well stored with wood, of which great quantities of charcoal are made, and sent to London.

Here is a weekly market on Saturday, and two annual fairs, viz. the fifth of July, and the second of October, for horses, bullocks, toys and sheep.

Bansted is a village noted for abundance of walnuts, but more for giving name to its downs, one of the most delightful spots of the kind in England, not only for its fine soft carpet ground, and the pretty villages around it, but for its pleasant prospect into Kent, Hertfordshire, Bucks, Oxfordshire, even beyond Henley upon Thames, Hampshire, Berkshire, and Middlesex; with a view of the royal palaces of Windsor and Hampton Court; and also of London, from the Tower to Westminster. These downs stretch thirty miles in length from Croydon to Farnham, though under different appellations; and are covered with a short herbage, perfumed with thyme and juniper; and therefore their mutton, though small, is sweet. The soil, which, in general, is a sort of chalk, mixed with flints and sand, is dry soon after rain. There is a four mile course on them, for horse-races, which is much frequented. The numbers of gentlemen and ladies that take the air here, mornings and evenings, in the fine season, some on horseback, and some in coaches, ranging either singly, or in separate companies, over every hill and dale, are a most entertaining object.

Darking is the chief town of its hundred, twenty-four miles from London, noted for its meal trade, and its market for poultry, particularly the fattest geese, and the largest capons, which are brought hither from Horsham in Sussex; where it is the business of all the country, for many miles, to breed and fatten them. Some are as big as turkey-pouts. Sussex wheat is brought hither from the wilds of that county, and most market-days it is furnished with all sorts of sea-fish. The town was destroyed by the Danes, but rebuilt by the Normans. It stands on a rock of soft sandy stone, in which are dug several convenient cellars. According to the custom of the manor, of which the Howard family of the Norfolk branch are lords, the youngest son or youngest brother of a customary tenant is heir of the customary estates of the tenant dying intestate. Some learned physicians have said, the best air in England is upon Cotman Dean, (i. e. the heath of poor cottages) belonging to this town, on which stand their alms-houses. The great Roman causeway, called Stone-street, passes through its church-yard, and is plainly traced two miles to the south of Okeley. It appears to be made of flints and pebbles, like those in the beeches of Sussex. 'Tis really a prodigious work, being from seven to ten yards broad, and near a yard and a half deep; which is the more remarkable, for that, in some places, there is not a flint to be seen within many miles of it; and therefore the common people think the devil had a hand in it.

Here is a weekly market on Thursdays, and one annual fair, held on the day before Ascension-day, for horses, bullocks, sheep, and toys.

Okeley, above-mentioned, in the same neighbourhood, is named so from the plenty of oaks growing on it. Its church-yard is remarkable for rose-bushes at the head of many of the graves, from a custom here, time out of mind, among the young lovers, that, at their death before marriage, the survivor plants a rose-tree at the head of the deceased's grave, which some of them are at the expence of keeping up many years; a practice derived, probably, from the Greeks and Romans, who, according to Anacreon and Ovid, thought roses planted or strewed upon the graves of the dead, perfumed and protected their ashes. There was a castle here formerly, of which the moat and mole of the keep is still remaining, near the church; and we read, that a bloody battle was fought here between the Saxon king Ethelwolf and the Danes, after their fifth invasion of England. The poor in these parts have an art of drawing peel'd rushes through melted greafe, to save candle.

The other antiquities and remarkables in this county, not yet mentioned, are, 1. The remains of a Roman camp, of about twelve acres, at Walton upon Thames, to which there runs a rampire, with its trench, from St. George's Hill. 2. A military work, of an orbicular form, near Wimbledon, called Bensbury, where Cheaulin king of the West Saxons fought and defeated one of the Kentish generals, in the first battle of the Saxons among themselves. 3. Effingham, a small village three miles south-west of Leatherhead, was anciently a town of note, and said to contain sixteen parish-churches; and 'tis certain, that, in the neighbourhood, the foundations of buildings are often discovered. 4. Near Aldbury, five miles east of Guildford, is the platform of a Roman temple, on the edge of Blackheath; and some Roman tiles are, to this day, found among the rubbish, with eight angles.

This place is remarkable also for a perforation or passage of at least a furlong in length, dug through the bottom of a great hill, and leading into a fine valley. it was intended for a way to the house, then the seat of Henry duke of Norfolk; but the design was hindered by a rock at the south end; yet it is still preserved and admired as a grotto. 5. A skeleton of a man, which measured nine feet three inches, was found in the church-yard at Wotton, as the labourers were enlarging a vault belonging to the Evelyns.

The Borough of Southwark, situated in this county, has been already described in our account of Middlesex, it making one of the divisions of London.

Curious PLANTS found in Surry.

Water-mint of a spicy smell, *Mentha arvensis verticillata folio rotundiore odore aromatico*, Ray. This is a very scarce plant, but found in the hedges near the foot of Box-hill.

Blue sweet-smelling toad-flax, *Linaria odorata nonpassulana*, J. B. found in the hedges near Farnham.

The fir-leaved Heath, with many flowers, *Erica foliis curios multiflora*, J. B. found on many of the heaths, particularly those near Godalming.

Roman Nettle, *Urtica pilulifera semine magno lini, seu urtica Romana*, Ray, found in the shady ditches in the neighbourhood of Croydon.

Round-leaved marsh St. Peter's wort, *Ascyrum palustre villosum*, Ray, found near the borders of springs, particularly about those of the Mole and the Wandle.

Verticillate Knot-grass, with thyme-like leaves, *Polygonum serpillifolium verticillatum*, Ray, found in watery places in many parts of the county.

Tender ivy-leaved Bell-flower, *Campanula palustre cymbalariae foliis*, Ger. found in several parts of this county, on watery banks.

Maiden Pinks, *Caryophyllus minor repens nostras*, Ray. These flowers, which the seedsmen call Matted Pinks, grow in plenty on the sandy hills, particularly near Esher.

Bird's-foot, *Ornithopodium majus*, Ger. found in the fields near Cobham.

Wood-pease, or Heath-pease, *Astragalus sylvaticus*, Ger. found on the heathy grounds near Godalming.

Thorow-wax, *Perfoliata vulgaris*, Ger. found among the corn near Croydon.

Self-heal, *Prunella vulgaris*, Park, found in the pasture-grounds near Kingston.

Buckthorn, *Rhamnus cathartica*, J. B. found in the hedges near Letherhead.

Wild Thyme, *Thymus sylvestris*, Ger. found in vast plenty on most of the downs and upland pastures of this county.

Squinancy-wort, *Synanchica Lugdunensis*, Ger. found on several parts of Leith-hill.

Wild-rue, *Ruta montanae*, Ger. found on some parts of the same hill.

Crested Cow-wheat, *Melampyrum Cristatum*, J. B. found plentifully in several parts of the county.

The later autumnal Gentian, with leaves like centaury, *Gentianella fugax autumnalis elatior centaurii minoris foliis*, Park, found on Bansted downs, though not in great plenty.

MEMBERS of PARLIAMENT for Surry.

This county sends fourteen members to parliament, two knights of the shire for the county, and two members for each of the following boroughs, Gatton, Haslemere, Blechingley, Ryegate, Guildford, and Southwark.

B E R K S H I R E.

THIS county is bounded by Hampshire on the south; by Wiltshire and Gloucestershire on the west; by the Thames, which divides it from the counties of Buckingham and Oxford, on the north; and on the east by Surry.

It is about thirty-nine miles in length, twenty-nine in breadth, one hundred and twenty in circumference, and contains nearly six hundred and fifty-four miles in area, or five hundred and twenty-seven thousand acres. It is divided into twenty hundreds, and contains twelve market-towns, one hundred and forty parishes, sixty-two vicarages, six hundred and seventy-one villages, and about eighty-five thousand inhabitants. It lies in the province of Canterbury, and diocese of Salisbury.

R I V E R S.

The principal rivers in this county are, the Thames, the Kennet, the Loddon, the Ocke, and the Lambourne.

The Thames, which rises in Gloucestershire, washes the northern part of this county from one extremity to the other, and is navigable, for large barges, to Lechlade. That part of this river intercepted between its source and its confluence with a small stream called the Tame, has been long termed the Isis, and yet there is incontestible proof that this is an erroneous appellation. The common people call this river the Thames quite from its source; and in an ancient charter granted to abbot Aldheim, particular mention is made of certain lands lying upon the east part of the river, "*cujus vocabulum Temis juxta vadum qui appellatur Summerford;*" and as this Summerford is in Wiltshire, it is evident that the river was then called Temis, or Tems, before its junction with the Tame. The same thing appears in every charter and authentic history where this river is mentioned, particularly in several charters granted to the abbey of Malmbury, and some old deeds relating to Cricklade, both which places are in Wiltshire. All our historians who mention the incursions of Ethelwald into Wiltshire, in the year 905, or of Canute in 1016, tell us, that they passed over the Thames at Cricklade. The Saxons called it Temese, from its source to its mouth, and from Temise, our Tems, or Thames, is immediately derived.

The principal branch of the Kennet rises in Wiltshire, enters this county at Hungerford, passes by Newbury and Reading, and falls into the Thames about two miles below the latter.

The Loddon rises in this county, near the town of Ockingham; and directing its course to the northward, falls into the Thames about two miles below Sunning.

The Ocke rises near Compton, a village in this county; passes by Standford, Shipton, and Abington, falling into the Thames about a mile below the latter.

The Lambourne rises near a town called Lower Lambourne, directing its course towards the south-east, near fifteen miles, passing by several villages, and falling into the Kennet about a mile and a half below Newbury. There is something very particular in this little river; the water being, contrary to most other streams, highest in summer, sinking gradually as the winter approaches, till at last the bed of the river is nearly, if not quite dry.

This extraordinary phenomenon is easily accounted for, by supposing that there is in the hill from which this stream issues, a large cavity, with a duct or passage in the form of a syphon, or crane, such as is commonly used to decant wine and other liquors. If this be granted, the solution will be very easy: the rain, which begins to fall plentifully in autumn, and continues during the

winter, will at length raise the water in the subterraneous basin to the level of the upper part of the syphon; when this happens, the water will begin to flow out at the aperture at the extremity of the other leg of the syphon, which being lower than that which communicates with the water in the basin, the water will continue to flow out till the surface of the water in the basin sinks below the aperture or leg of the syphon communicating with it. The consequence of this is, the basin being filled during the winter, the duct will begin to run in the spring, and continue running all the summer; but this being a dry season, and not supplying the basin with water as fast as it is exhausted, the water will at length sink below the aperture in the shorter leg of the syphon, and therefore the water will cease to run till it rises again in the basin to the level of the upper part or bend of the syphon, which will happen the beginning of the following summer; and thus the stream will always run in the dry season, and become dry in the wet, except the little it borrows from the trickling of the adjacent springs.

Remarks on the INLAND NAVIGATION of Berkshire.

The only navigable rivers in this county are, the Thames and the Kennet. The former is navigable, for large barges, to Lechlade in Gloucestershire, and small boats go much higher. But this navigation, for want of proper care, is now become so extremely bad, that it is hardly possible to pass up and down the stream when the water is low. Several enormous banks of sand and gravel are collected in different parts of the stream, so that there is not sometimes water sufficient for loaded barges to pass for several months together. Near Abingdon, there is a very remarkable bank of this kind, called Abingdon-ditch, occasioned by the influx of the Ocke; and though this shoal might be removed at a trifling expence, it is suffered to remain, and will, in all probability, continue there, till the navigation is entirely stopped, when necessity, perhaps, will prevail upon those whose interest is more essentially concerned in the navigation of this river, to remove a nuisance long complained of in vain. But we would not be understood to mean, that this is the only bank in this river which impedes the navigation; there are a great many more, though perhaps none so very remarkable. In a word, the whole navigation is so shamefully neglected, that a river capable of being made the best navigation in England, is now absolutely the worst. There is, however, some reason to hope, that this navigation will very soon be wholly altered, and rendered at once both safe and expeditious.

The Kennet is navigable to within a small distance of Newbury; and the largest barges come up to Reading bridge, where there are commodious wharfs for loading and clearing them.

AIR, SOIL, and NATURAL PRODUCTIONS.

The air of Berkshire is healthy, even in the vallies; and though the soil is not remarkable for its fertility, yet the appearance is very pleasant, being delightfully varied with hills and vallies, woods and water, which are seen at once in almost every prospect.

Many parts of the county are covered with fine timber, particularly oak and beech, and some districts of it produce great plenty of wheat and barley. It is most fruitful on the banks of the Thames and the Kennet, and in the parts about Lambourne, on the western side where it borders upon Wiltshire, particularly what is called the vale of White Horse; on the east side, where it borders upon Surry, it is rather barren, being covered with woods and forests.

MANUFACTURES.

Berkshire had formerly a greater share of the woollen manufacture than any other part of the island; and its principal manufactures are still woollen cloth, canvas, and malt.

Remarks on the HUSBANDRY of Berkshire.

The soil of this county is very different. The meadows on the banks of the rivers produce large quantities of grass, and feed great numbers of cattle. Vast flocks of sheep are kept upon the downs, and in the upland pastures, and folded every night for the sake of their manure, a very commendable piece of husbandry. The vallies are most of them arable lands, but of two kinds of soil, one heavy, and the other light turnip land. The former they use chiefly for wheat and beans, and the latter for turnips, barley, &c. Their course of crops on the former is, 1. fallow; 2. wheat; 3. barley; 4. pease, oats, beans, clover, or tares. For wheat they plough three or four times, sow three bushels, or three and a half on an acre, and reckon between three and four quarters a middling crop. For barley they plough from once to thrice, sow three bushels, and get, on a medium, three or four quarters. Oats they plough for but once, sow five or six bushels, and gain, on a medium, from four to five quarters. They plough twice for beans, sow about four bushels, and reap about two quarters and a half, without ever hoeing them. The rents are very variable here, from ten to twenty shillings an acre. Some farms also are very large, and others small. The course of husbandry in the light turnip lands is different; 1. turnips; 2. barley; 3. clover; 4. wheat. Their ploughs are in general drawn by four horses, driven by a boy, while a man holds the plough, and do about an acre a day. The price of labour is very different in the several parts of this county, being dearer in the eastern than in the western parts. In winter a labourer has one shilling and six-pence; in hay-time, two shillings, with small beer; and in harvest, two shillings and six-pence; reaping wheat, from five to eight shillings per acre; mowing grass, two shillings and six-pence; barley, two shillings.

BOROUGH, and MARKET TOWNS, &c.

We entered the county of Berkshire from Surry, and came first to Windsor, so famous for having been long one of the royal seats.

Windsor, so called from its winding shore, is a pleasant and well inhabited borough, twenty-three miles from London, agreeably situated on the south bank of the Thames, in the midst of delightful vallies. Its church is a spacious ancient building, situated in the High-street of the town, in which is also the town-house, a neat regular edifice built in 1686, and supported with columns and arches of Portland stone: at the north end is placed in a niche the statue of queen Anne, in her royal robes, with the globe and other regalia; and underneath, in the freeze of the entablature of the lesser columns and arches, is the following inscription in gold letters:

Anno Regni VI^o.
Dom. 1707.

*Arte tua, sculptor, non est imitabilis ANNA;
ANNÆ vis similem sculpere? sculpe Deam
S. Chapman, Prætor.*

And in another niche, on the south side, is the statue of prince George of Denmark, her majesty's royal consort, in a Roman military habit; and underneath is the following inscription:

*Serenissimo Principi
GEORGIA Principi Daniæ,
Heroui omni sæculo venerando,
Christophorus Wren Arm.
Posuit. MDCCXIII.*

In the area, underneath the town-hall, the market is kept every Saturday; and is plentifully supplied with corn, meat, fish, and all other provisions.

Besides the castle, the chief ornament of the place, many gentlemen of fortune and family constantly reside in the town and its neighbourhood. The duke of St. Alban's has a handsome large house on the east part of the town, with pleasant gardens that extend to the park; and at the south side of the town is Sir Edward Walpole's house, a neat regular edifice; with large gardens beautifully laid out and designed.

The castle of Windsor, the most delightful palace of our sovereigns, was first built by William the Conqueror soon after his being established on the throne of this kingdom, on account of its pleasant and healthful situation, and as a place of security. It was greatly improved by Henry I. who added many additional buildings, and surrounded the whole with a strong wall. Our succeeding monarchs resided in the same castle, till king Edward III. caused the ancient building to be taken down; erected the present stately castle, and St. George's chapel; inclosed the whole with a strong wall or rampart of stone, and instituted the most noble order of the garter.

It may be proper to observe, that William of Wickham, afterwards bishop of Winchester, was principally employed by Edward III. in building this castle; and when he had finished it, he caused this doubtful sentence to be cut on one of the towers,

THIS MADE WICKHAM:

which being reported to the king, as if that prelate had assumed to himself the honour of building this castle, that bishop would probably have fallen under his majesty's displeasure, had he not readily assured his royal master, that he meant it only as an acknowledgment, that this building had *made him great* in the favour of his prince, and had occasioned his being raised to his present high station.

Great additions were, in succeeding times, made to the castle, by several of our monarchs, particularly by Edward IV. Henry VII. Henry VIII. Elizabeth, and Charles II. This last prince, soon after the restoration, entirely repaired the castle; and though it had suffered greatly by plunder and rapine, in the preceding times of national disorder, he restored it to its ancient splendor. As that prince usually kept his court there during the summer season, he spared no expence in rendering it worthy the royal residence; he entirely changed the face of the upper court; he enlarged the windows, and made them regular, richly furnished the royal apartments, and had them decorated with large and beautiful paintings, and erected a large magazine of arms.

In short, king Charles II. left little to be done to the castle, except some additional paintings in the apartments, which were added by his successors, James II. and William III. in whose reign the whole was completed.

This stately and venerable castle is divided into two courts or wards, with a large round tower between them called the Middle Ward, it being formerly separated from the lower ward by a strong wall and draw-bridge. The whole contains above twelve acres of land, and has many towers and batteries for its defence: but length of time has abated their strength, and the happy union that subsists between the prince and people, has made it unnecessary to keep these fortifications in perfect repair.

The castle is situated upon a high hill, which rises by a gentle ascent, and enjoys a most delightful prospect around it: in the front is a wide and extensive vale, adorned with corn fields and meadows; with groves on either side, and the calm smooth water of the Thames running through it, and behind it are every where hills covered with woods, as if dedicated by nature for game and hunting.

On the declivity of the hill is a fine terrace, faced with a rampart of free-stone, one thousand eight hundred and seventy feet in length. This may justly be said to be one of the noblest walks in Europe, both with respect to the strength and grandeur of the building, and the fine

and

and extensive prospect over the Thames of the adjacent country on every side, where from the variety of fine villas scattered about, nature and art seem to vie with each other in beauty.

From this terrace you enter a beautiful park, which surrounds the palace, and is called the little or house park, to distinguish it from another adjoining, which is of a much larger extent. This little park is four miles in circumference, and surrounded by a brick wall. The turf is of the most beautiful green, and it is adorned with many shady walks, especially that called Queen Elizabeth's, which, on the summer evenings, is frequented by the best company. A fine plain on the top of the hill was made level for bowling in the reign of king Charles II. and from hence is the like extended prospect over the Thames, and the same beautiful and well cultivated country. The park is well stocked with deer and other game, and the keeper's lodge at the farther end is a delightful habitation.

But to return to the castle. In the upper court is a spacious and regular square, containing on the north side the royal apartments, and St. George's chapel and hall; on the south and the east sides are the royal apartments, those of the prince of Wales, and the great officers of state; and in the centre of the area is an equestrian statue, in copper, of king Charles II. in the habit of one of the Cæsars, standing on a marble pedestal, adorned with various kinds of fruit, fish, shipping, and other ornaments. On the east side is the following inscription on a shield:

CAROLO SECUNDO.
*Regum Optimo,
 Domino suo clementissimo.*
 Tobias Rustat
*Hanc Effigiem humilime
 Dedit et Dedicavit,
 Anno Domini MDCLXXX.*

The Round Tower, which forms the west side of this upper court, contains the governor's apartments. It is built on the highest part of the mount, and there is an ascent to it by a large flight of stone steps. These apartments are spacious and noble, and among the rest is a guard-room or magazine of arms. King Charles II. began to face this mount with brick, but only completed that part next the court.

The Lower court is larger than the other, and is in a manner divided into two parts by St. George's chapel, which stands in the centre. On the north, or inner side, are the several houses and apartments of the dean and canons of St. George's chapel, with those of the minor canons, clerks, and other officers; and on the south and west sides of the outer part, are the houses of the poor knights of Windsor. In this court are also several towers belonging to the officers of the crown, when the court is at Windsor, and to the officers of the order of the garter.

The royal apartments are on the north side of the Upper court, and are usually termed the Star building, from a star and garter in gold in the middle of the structure, on the outside next the terrace.

The entrance into the apartments is through a handsome vestibule, supported by columns of the Ionic order, with some antique busts in several niches: from hence you proceed to the great stair-case, which is finely painted with several fabulous stories from Ovid's *Metamorphoses*. In the dome, Phaeton is represented desiring Apollo to grant him leave to drive the chariot of the sun. In large compartments, on the stair-case, are the transformation of Phaeton's sisters into poplar trees, with this inscription, *Magnis tamen excidit Ausis*; and Cynus changed into a swan. In several parts of the ceiling are represented the signs of the Zodiac supported by the winds, with baskets of flowers beautifully disposed. At the corners are the four Elements, each expressed by a variety of figures. Aurora is also represented with her nymphs in waiting, giving water to her horses. In several parts of the stair-case are the figures of Music, Painting, and the other Sciences. The whole is beautifully disposed and heightened with gold, and

from this stair-case you have a view of the back stairs, painted with the story of Meleager and Atalanta.

I. Having ascended the stair-case, you enter first into the queen's guard-chamber, which is completely furnished with guns, pistols, bayonets, pikes, swords, &c. beautifully ranged and disposed into various forms, as the star and garter, the royal cypher, and other ornaments. On the ceiling is Britannia in the person of queen Catharine of Portugal, consort to king Charles II. seated on a globe, bearing the arms of England and Portugal, with the four grand divisions of the earth, Europe, Asia, Africa, and America, attended by deities, making their several offerings. On the outer part of this beautiful group, are the signs of the Zodiac, and in different parts of the ceiling are Minerva, Mars, Venus, and other Heathen deities, with Zephyrs, Cupids, and other embellishments properly disposed. Over the chimney is a portrait of prince George of Denmark on horseback, by Dahl; with a view of shipping by Vandewell.

II. You next enter the Queen's presence chamber, where queen Catharine is represented attended by Religion, Prudence, Fortitude, and other Virtues: she is under a curtain spread by Time, and supported by Zephyrs, while Fame sounds the happiness of Britain. Below, Justice is driving away Envy, Sedition, and other evil Genii. The room is hung with tapestry, containing the history of the beheading of St. Paul, and the persecution of the primitive Christians; and adorned with the pictures of Judith and Holofernes, by Guido Reni; a Magdalen, by Sir Peter Lely; and a Prometheus by young Palma.

III. On entering the Queen's audience chamber, you see the ceiling painted with Britannia in the person of queen Catharine, in a car drawn by swans to the temple of Virtue, attended by Flora, Ceres, Pomona, &c. with other decorations heightened with gold. The canopy is of fine English velvet, set up by queen Anne, and the tapestry was made at Coblenz in Germany, and presented to king Henry VIII. The pictures hung up in this room are, a Magdalen by moon-light, by Carracci; St. Stephen stoned, by Rotterman; and Judith and Holofernes, by Guido Reni.

IV. On the ceiling of the Ball-room, king Charles II. is represented giving freedom to Europe by the figures of Perseus and Andromeda: on the shield of Perseus is inscribed, *Perseus Britannicus*; and over the head of Andromeda is wrote, *Europa Liberata*; and Mars, attended by the celestial deities, offers the olive branch. On the coving of this chamber is the story of Perseus and Andromeda, the four seasons, and the signs of the Zodiac, the whole heightened with gold. The tapestry, which was made at Brussels, and set up by king Charles II. represents the seasons of the year; and the room is adorned with the following pictures, the Roman Charity, after Tintoret; Duns Scotus, by Spagnoletto; a Madonna, by Titian; Fame, by Palmegiani; the Arts and Sciences, also by Palmegiani; and Pan and Syrinx, by Stanick.

V. The next room you enter is the Queen's drawing-room, where, on the ceiling, is painted the assembly of the gods and goddesses, the whole intermixed with Cupids, flowers, &c. and heightened with gold. The room is hung with tapestry, representing the twelve months of the year, and adorned with the pictures of Lot and his daughters, after Angelo; lady Digby, wife of Sir Kenelm Digby, by Vandyke; a sleeping Venus, by Pouffin; a family in the character of Mark Anthony and Cleopatra, by De Bray; a Spanish family, after Titian; and a flower-piece, by Varelst.

VI. In the Queen's bed-chamber, the bed of state is rich flowered velvet, made in Spitalfields by order of queen Anne; and the tapestry, which represents the harvest season, was also made at London, by Poyntz. The ceiling is painted with the story of Diana and Endymion, and the room is adorned with the pictures of the Holy Family, by Raphael; Herod's cruelty, by Giulio Romano; and Judith and Holofernes, by Guido.

VII. The next is the room of Beauties, so named from the portraits of the most celebrated beauties in the reign of king Charles II. They are fourteen in number,

viz.

viz. Lady Offory, the dutchefs of Somerfet, the dutchefs of Cleveland, lady Gramont, the countefs of Northumberland, the dutchefs of Richmond, lady Birons, Mrs Middleton, lady Denham and her fifter; lady Rochefter, lady Sunderland, Mrs. Dawson, and Mrs. Knott. These are all original paintings, drawn to great perfection by Sir Peter Lelly.

VIII. In the Queen's dressing-room are the following portraits, queen Henrietta Maria, wife to king Charles I. queen Mary, when a child, and queen Catharine: these three are all done by Vandyke. The dutchefs of York, mother to queen Mary and queen Anne, by Sir Peter Lelly.

In this room is a closet wherein are several paintings, and in particular a portrait of the countefs of Desmond, who is said to have lived to within a few days of an hundred and fifty years of age: also a portrait of Erasmus, and other learned men. In this closet is likewise the banner of France, annually delivered on the second of August by the duke of Marlborough, by which he holds Blenheim house, built at Woodstock in Oxfordshire in the reign of queen Anne, as a national reward to that great general for his many glorious victories over the French.

IX. You are next conducted into Queen Elizabeth's, or the Picture Gallery, which is richly adorned with the following paintings: King James I. and his queen, whole lengths, by Vansomer; Rome in flames, by Giulio Romano; a Roman family, by Titian; the Holy Family, after Raphael; Judith and Holofernes, by Tintoret; a night-piece, by Skalkin; the pool of Bethesda, by Tintoret; a portrait of Charles VI. emperor of Germany, by Sir Godfrey Kneller; the wife men making their offerings to Christ, by Paulo Veronese; two usurers, an admired piece, by the famous blacksmith of Antwerp; Perseus and Andromeda, by Schiavone; Aretine and Titian, by Titian; the duke of Gloucester, a whole length, by Sir Godfrey Kneller; prince George of Denmark, a whole length, by Dahl; king Henry VIII. by Hans Holbein; Vandanelli, an Italian statuary, by Correggio; the founders of different orders in the Romish church, by Titian and Rembrandt; a rural piece in low life, by Bassano; a fowl-piece, by Varelst; the battle of Spurs, near Terevaen in France, in 1513, by Hans Holbein; two views of Windsor castle, by Wofterman, and two Italian markets, by Michael Angelo. In this room is also a curious amber cabinet, presented by the king of Prussia to queen Caroline.

There is here likewise queen Caroline's china closet, filled with a great variety of curious china elegantly disposed, and the whole room is finely gilt and ornamented. Over the chimney are the pictures of prince Arthur, and his two sisters, the children of K. Henry VII. by Holbein; and in this closet is also a fine amber cabinet, presented to queen Anne by Dr. Robinson, bishop of London, and plenipotentiary at the congress of Utrecht.

X. From this gallery a return is made to the King's Closet, the ceiling of which is adorned with the story of Jupiter and Leda. Among the curiosities in this room is a large frame of needle-work, said to be wrought by Mary Queen of Scots, while a prisoner in Forthinghay-castle. Among other figures, she herself is represented supplicating for justice before the Virgin Mary, with her son, afterwards king James I. standing by her. In a scrawl are worked these words, *Sapientiam amavi et exquisivi a juventute mea.* This piece of work, after its having lain a long time in the wardrobe, was set up by order of queen Anne. The pictures are, a Magdalen, by Carracci; a sleeping Cupid, by Correggio; Contemplation, by Carracci; Titian's daughter, by herself; and a German lady, by Raphael.

XI. You are next conducted into the King's dressing-room, where the ceiling is painted with the story of Jupiter and Danae, and adorned with the pictures of the birth of Jupiter, by Giulio Romano; and of a naked Venus asleep, by Sir Peter Lelly.

XII. On leaving the above room, you are conducted into the King's Bed-chamber, which is hung with tapestry representing the story of Hero and Leander.

The bed of state, which was set up in the reign of king Charles II. is of fine blue cloth, richly embroidered with gold and silver; and on the ceiling that prince is represented in the robes of the garter, under a canopy supported by Time, Jupiter and Neptune; with a wreath of laurel over his head; and he is attended by Europe, Asia, Africa, and America, paying their obedience to him. The paintings are, king Charles II. when a boy, in armour, by Vandyke; and St. Paul stoned at Lystra, by Paulo Veronese.

XIII. The ceiling of the King's Drawing-room, which is next seen, is finely painted with king Charles II. riding in a triumphal car, drawn by the horses of the sun, attended by Fame, Peace, and the polite arts; Hercules is driving away Rebellion, Sedition and Ignorance; Britannia and Neptune, properly attended, are paying obedience to the Monarch as he passes; and the whole is a lively representation of the restoration of that monarch, and the introduction of arts and sciences into these kingdoms. In the other parts of the ceiling are painted the labours of Hercules, with festoons of fruit and flowers, the whole beautifully decorated in gold and stone colour. The pictures hung up in this room are, a converted Chinese, by Sir Godfrey Kneller; the marquis of Hamilton, after Vandyke, by Hanneman; Herodias's daughter, by Carlo Dolci; a Magdalen, by Carlo Dolci; and a Venetian lady, by Titian.

XIV. You next enter the King's Drawing-room, where the painted ceiling represents the banquet of the gods, with a variety of fish and fowl. The pictures hung up here are, the portraits of his present majesty, and the late queen Caroline, whole lengths; Hercules and Omphale, Cephalus and Procris, the birth of Venus, and Venus and Adonis, the four last by Genario; a naval triumph of king Charles II. by Verrio; the marriage of St. Catharine, by Dawkers; nymphs and satyrs, by Rubens and Snyders; hunting the wild boar, by Snyders; a picture of still life, by Girardo; the taking of the bears, by Snyders; a night-piece, being a family singing by candle light, by Quittin; a Bohemian family, by de Brie; divine love, by an unknown hand; and Lacy, a famous comedian in king Charles II.'s time, in three characters, by Wright.

Many of the paintings in this room are best seen at noon by the reflection of the sun. The carving of this chamber is very beautiful, representing a great variety of fowl, fish, and fruit, done to the utmost perfection on lime wood, by Mr. Gibbons, a famous statuary and carver in the reign of king Charles II.

XV. In the King's Audience-chamber, the canopy, which was set up in the reign of king Charles II. is of green velvet, richly embroidered with gold; and on the ceiling is represented the establishment of the church of England at the restoration, in the characters of England, Scotland, and Ireland, attended by Faith, Hope, Charity, and the cardinal virtues; Religion triumphs over Superstition and Hypocrisy, who are driven by Cupids from before the face of the church, all which are represented in their proper attitudes, and highly finished. The pictures hung up in this room are, our Saviour before Pilate, by Michael Angelo; the Apostles at our Saviour's tomb, by Scavoni; Peter, James, and John, by Michael Angelo; and the dutchefs of Richmond, by Vandyke.

XVI. The King's Presence-chamber is hung with tapestry containing the history of queen Athaliah, and the ceiling is finely adorned with painting: Mercury is represented with an original portrait of king Charles II. which he shews to the four quarters of the world, introduced by Neptune; Fame declaring the glory of that prince, and Time driving away Rebellion, Sedition, and their companions. Over the canopy is Justice in stone colour, shewing the arms of Britain to Thames and the river nymphs, with the star of Venus, and this label, *Sydyus Carolynum*: at the lower end of the chamber is Venus in a marine car drawn by tritons and sea-nymphs. The portraits hung up are, Henry duke of Gloucester, brother to king Charles II. and his governess the countefs of Dorset, both by Vandyke; and father Paul, by Tintoret.

XVII. The King's Guard-chamber, which you next enter, is a spacious and noble room, in which is a large magazine of arms, consisting of some thousands of pikes, pistols, guns, coats of mail, swords, halberts, bayonets, and drums, disposed in a most curious manner in colonades, pillars, circles, shields, and other devices, by Mr. Harris, late master gunner of this castle, the person who invented this beautiful arrangement of arms, and placed those in the great armoury in the Tower of London. The ceiling is finely painted in water-colours: in one circle is Mars and Minerva, and in the other Peace and Plenty. In the dome is also a representation of Mars; and over the chimney-piece is a picture of Charles XI. king of Sweden, on horseback, at big as the life, by Wyck.

At an installation, the knights of the garter dine here in great state in the absence of the sovereign.

XVIII. You next enter St. George's Chamber, which is particularly set apart to the honour of the most illustrious order of the garter, and is perhaps one of the noblest rooms in Europe, both with regard to the building and the painting, which is here performed in the most grand taste. In a large oval in the centre of the ceiling, king Charles II. is represented in the habit of the order, attended by England, Scotland, and Ireland; Religion and Plenty hold the crown of these kingdoms over his head; Mars and Mercury, with the emblems of war and peace, stand on each side. In the same oval regal government is represented, upheld by Religion and Eternity, with Justice attended by Fortitude, Temperance and Prudence, beating down Rebellion and Faction. Towards the throne is represented in an octagon, St. George's cross circled with the garter, within a star or glory supported by Cupids, with the motto,

HONI SOIT QUI MAL Y PENSE :

and besides other embellishments relating to the order, the Muses are represented attending in full consort.

On the back of the state, or sovereign's throne, is a large drapery, on which is painted St. George encountering the dragon, as large as the life; and on the lower border of the drapery is inscribed,

VENIENDO RESTITUIT REM :

in allusion to king William III. who is painted in the habit of the order, sitting under a royal canopy, by Sir Godfrey Kneller. To the throne is an ascent by five steps of fine marble, to which the painter has added five more, which are done with such perfection as to deceive the sight, and induce the spectator to think them equally real.

This noble room is an hundred and eight feet in length, and the whole north side is taken up with the triumph of Edward the Black Prince, after the manner of the Romans. At the upper part of the hall is Edward III. that prince's father, the conqueror of France and Scotland, and the founder of the order of the garter, seated on a throne, receiving the kings of France and Scotland prisoners: the Black Prince is seated in the middle of the procession, crowned with laurel, and carried by slaves, preceded by captives, and attended by the emblems of Victory, Liberty, and other *insignia* of the Romans, with the banners of France and Scotland displayed. The painter has given a loose to his fancy, by closing the procession with the fiction of the countess of Salisbury, in the person of a fine lady, making garlands for the prince, and the representation of the Merry Wives of Windsor.

At the lower end of the hall is a noble music gallery, supported by slaves, larger than the life, in proper attitudes, said to represent a father and his three sons taken prisoners by the Black Prince in his wars abroad. Over this gallery, on the lower compartment of the ceiling, is the collar of the order of the garter fully displayed. The painting of this room was done by Verro, and is highly finished, and heightened with gold.

XIX. You are next conducted to St. George's or the King's Chapel, which is no less royally adorned. On the ceiling is finely represented our Lord's ascension; and the altar-piece is adorned with a noble painting of the

Last Supper. The north side of the chapel is ornamented with the representation of our Saviour's raising Lazarus from the dead, his curing the sick of the palsy, and other miracles, beautifully painted by Verro; and in a group of spectators, the painter has introduced his own effigy, with those of Sir Godfrey Kneller, and Mr. Cooper, who assisted him in these paintings. The east end of this chapel is taken up with the closets belonging to his majesty and the royal family. The canopy, curtains, and furniture, are of crimson velvet, fringed with gold; and the carved work of this chapel, which is well worthy the attention of the curious, is done by that famous artist Gibbons, in lime-tree, representing a great variety of pelicans, doves, palms, and other allusions to scripture history, with the star and garter, and other ornaments finished to great perfection.

From St. George's Chapel you are conducted to the Queen's Guard-chamber, the first room you entered; for this is the last of the state apartments at present shown to the public, the others being only opened when the court resides at Windsor. They consist of many beautiful chambers, adorned with the paintings of the greatest masters.

In passing from hence, the stranger usually looks into the inner or horn-court, so called from a pair of stags horns of a very extraordinary size, taken in the forest, and set up in that court, which is painted in bronze and stone colour. On one side is represented a Roman battle, and on the opposite side a sea-fight, with the images of Jupiter, Neptune, Mercury and Pallas; and in the gallery is a representation of king David playing before the ark.

From this court a flight of stone steps lead to the King's Guard-chamber; and in the cavity under these steps, and fronting this court, is a figure of Hercules also in stone colours. On a dome over the steps, is painted the battle of the Gods; and on the sides of the stair-case is a representation of the four ages of the world, and two battles of the Greeks and Romans in fresco.

Among the buildings of this noble palace we have mentioned the chapel of St. George, situated in the middle of the lower court. This ancient structure, which is now in the purest stile of Gothic architecture, was first erected by king Edward III. in the year 1337, soon after the foundation of the college, for the honour of the order of the garter, and dedicated to St. George, the patron of England; but however noble the first design might be, king Edward IV. not finding it entirely completed, enlarged the structure, and designed the present building, together with the houses of the dean and canons, situated on the north and west sides of the chapel: the work was afterwards carried on by Henry VII. who finished the body of the chapel; and Sir Reginald Bray, knight of the garter, and the favourite of that king, assisted in ornamenting the chapel and completing the roof.

The architecture of the inside has always been esteemed for its neatness and great beauty; and in particular, the stone roof is reckoned an excellent piece of workmanship. It is an ellipsis supported by Gothic pillars, whose ribs and groins sustain the whole ceiling, every part of which has some different device well finished, as the arms of Edward the Confessor, Edward III. Henry VI. Edward IV. Henry VII. and Henry VIII. also the arms of England and France quarterly, the cross of St. George, the rose, portcullis, lion rampant, unicorn, &c. In a chapel in the south isle is represented in ancient painting, the history of John the Baptist; and in the same isle are painted on large pannels of oak, neatly carved, and decorated with the several devices peculiar to each prince, the portraits, at full length, of prince Edward, son to Henry VI. Edward IV. Edward V. and Henry VII. In the north isle is a chapel dedicated to St. Stephen, wherein the history of that saint is painted on the pannels, and well preserved. In the first of these pannels St. Stephen is represented preaching to the people; in the second, he is before Herod's tribunal; in the third, he is stoning; and in the fourth, he is represented dead. At the east end of this isle is the chapter-house of the college, in which is a portrait at full length, by a

masterly

masterly hand, of the victorious Edward III. in his robes of state, holding in his right hand a sword, and bearing the crowns of France and Scotland, in token of the many victories he gained over those nations. On one side of this painting is kept the sword of that great and warlike prince.

But what appears most worthy of notice is the choir. On each side are the stalls of the sovereign and knights companions of the most noble order of the garter, with the helmet, mantling, crest, and sword, of each knight set up over his stall on a canopy of ancient carving curiously wrought; and over the canopy is affixed the banner or arms of each knight properly blazon'd on silk; and on the back of the stalls are the titles of the knights, with their arms neatly engraved and blazoned on copper. The sovereign's stall is on the right hand of the entrance into the choir, and is covered with purple velvet and cloth of gold, and has a canopy and complete furniture of the same valuable materials; his banner is likewise of velvet, and his mantling of cloth of gold. The prince's stall is on the left, and has no distinction from those of the rest of the knights companions, the whole society, according to the statutes of the institution, being companions and colleagues, equal in honour and power.

The altar-piece was, soon after the Restoration, adorned with cloth of gold and purple damask by king Charles II. but on removing the wainscot of one of the chapels in 1707, a fine painting of the Lord's Supper was found, which being approved of by Sir James Thornhill, Verrio, and other eminent masters, it was repaired and placed on the altar-piece.

Near the altar is the Queen's Gallery, for the accommodation of the ladies at an installation.

In a vault under the marble pavement of this choir, are interred the bodies of Henry VIII. and Jane Seymour his queen, King Charles I. and a daughter of the late queen Anne. In the fourth isle, near the door of the choir, is buried Henry VI. and the arch near which he was interred was sumptuously decorated by Henry VIII. with the royal ensigns and other devices, but they are now much defaced by time.

In this chapel is also the monument of Edward earl of Lincoln, lord high admiral of England in the reign of queen Elizabeth, erected by his lady, who is also interred with him. The monument is of alabaster, with pillars of porphyry.

Another, within a neat screen of brass work, is erected to the memory of Charles Somerset, earl of Worcester, and knight of the garter, who died in 1526, and his lady, daughter to William earl of Huntingdon.

A stately monument of white marble erected to the memory of Henry Somerset, duke of Beaufort, and knight of the garter, who died in 1699. There are here also the tombs of Sir George Manners, lord Roos; that of the lord Hastings, chamberlain to Edward IV. and several others.

Before we conclude our account of this ancient chapel, it will be proper to observe, that king James II. made use of it for the service of popery, and mass being publicly performed there, it has ever since been neglected and suffered to run to ruin; and being no appendage to the collegiate church, waits the royal favour to retrieve it from the disgrace of its present situation.

With respect to the royal foundations in this castle, they are the most noble order of the garter, which consists of the sovereign and twenty-five knights companions: the royal college of St. George, which consists of a dean, twelve canons, seven minor canons, eleven clerks, an organist, a verger, and two sacrist; and the alms knights, who are eighteen in number, viz. thirteen of the royal foundation, and five of the foundation of Sir Peter le Maire, in the reign of king James I.

Windfor castle being the seat of the most illustrious order of the knights of the garter, it may be expected that we should here give some account of it. The order of the garter was instituted by Edward III. in the year 1349, for the improvement of military honour, and the reward of virtue. It is also called the order of St. George, the patron of England, under whose banner the English always went out to war, and St. George's cross was

made the ensign of the order. The garter was, at the same time, appointed to be worn by the knights on the left leg, as a principal mark of distinction, not from any regard to a lady's garter, "but as a tye or band of association in honour and military virtue, to bind the knights companions strictly to himself and each other, in friendship and true agreement, and as an ensign or badge of unity and combination, to promote the honour of God, and the glory and interest of their prince and sovereign." At that time king Edward being engaged in prosecuting, by arms, his right to the crown of France, caused the French motto, *HONI SOIT QUI MAL Y PENSE*, to be wrought in gold letters round the garter, declaring thereby the equity of his intention, and at the same time retorting shame and defiance upon him who should dare to think ill of the just enterprize in which he had engaged, for the support of his right to that crown.

The installation of a knight of this most noble order consists of many ceremonies established by the royal founder, and the succeeding sovereigns of the order, the care of which is committed to Garter king at arms, a principal officer of the order, appointed to support and maintain the dignity of this noble order of knighthood.

On the day appointed for the installation, the knights commissioners appointed by the sovereign to install the knights elect, meet in the morning, in the great chamber in the dean of Windfor's house, dressed in the full habit of the order, where the officers of the order also attend in their habits; but the knights elect come thither in their under habits only, with their caps and feathers in their hands.

From hence the knights walk two and two in procession to St. George's chapel, preceded by the poor knights, prebends, heralds, pursuivants, and other officers of the order, in their several habits: being arrived there, the knights elect rest themselves in chairs behind the altar, and are respectively introduced into the chapter-house, where the knights commissioners (Garter and the other officers attending) invest them with the surcoat or upper habit of the order, while the register reads the following admonition: "Take this robe of crimson to the increase of your honour, and in token or sign of the most noble order you have received, wherewith you being defended, may be bold, not only strong to fight, but also to offer yourself to shed your blood for Christ's faith, and the liberties of the church, and the just and necessary defence of them that are oppressed and needy." Then Garter presents the crimson velvet girdle to the commissioners, who buckle it on, and also girds on the hanger and sword.

The procession of each knight elect separately is afterwards made into the choir, attended by the lords commissioners, and other companions of the order, and preceded by the poor knights, prebends, &c. as before, Garter in the middle carrying, on a crimson velvet cushion, the mantle, hood, garter, collar, and George; having the register on his right hand, who carries the New Testament, and the oath fairly written on parchment, and the black rod on his left. On entering the choir, after reverence made to the altar, and the sovereign's stall, the knights are conducted to their several stalls, under their respective banners, and other ensigns of honour. The knights elect then take the oath, and are completely dressed, invested with the mantle of the order, and the great collar of St. George, which is done with great state and solemnity.

After the installation, the knights make their solemn offerings at the altar, and prayers being ended, the grand procession of the knights is made from the choir in their full habits of the order, with their caps frequently adorned with diamonds, and plumes of feathers on their heads, round the body of the church; and passing out at the south door, the procession is continued in great state through the courts of the castle into St. George's Hall, preceded by his majesty's music, in the following order; the poor knights of Windfor; the choir of St. George's chapel; the canons, or prebends of Windfor; the heralds and pursuivants at arms; the dean of Windfor; register of the order, with garter king at arms on his

right hand, and on his left the black rod of the order; the knights companions, according to their stalls, their trains supported by the choristers of St. George's chapel.

The knights having for some time rested in the royal apartments, a sumptuous banquet is prepared, if the sovereign be present, in St. George's Hall, and in his absence, in the great Guard-chamber next adjoining, and the knights are introduced, and dine with great state in the habits of the order, the music attending. Before dinner is ended, Garter king at arms proclaims the style and dignity of each knight, after which the company retire, and the evening is closed with a ball for the ladies in the royal lodgings.

As we have already described the town of Windsor, the little park and castle, and given some account of the order of knights of the Garter, we are naturally led to mention the great park, which lies on the south side of the town, and opens by a noble road in a direct line to the top of a delightful hill at near three miles distance. This road leads through a double plantation of trees on each side, to the ranger's or keeper's lodge, at present the residence of his royal highness the duke of Gloucester. The late duke of Cumberland greatly improved the natural beauties of the park, and by large plantations of trees, extensive lawns, new roads, canals, and rivers, rendered this villa an habitation worthy of a prince.

The great park is fourteen miles in circumference, and is well stocked with deer and other game; many foreign beasts and birds were here also kept by his late royal highness, who was continually adding new improvements. The new erected building on Shrub's-hill, adorned beneath with the prospect of the most beautiful verdure, and a young plantation of trees, is very elegant, and promises in a short time to afford the most delightful rural scene; the noble piece of water below, produced at a great expence from a small stream, is now rendered capable of carrying barges and boats of pleasure. Over this river, which terminates in a grotto and large cascade, his royal highness erected a bridge on a noble and bold plan, it consisting of one single arch, one hundred and sixty-five feet wide.

But his royal highness's attention was not confined to the park alone, but in like manner extended to the adjoining forest, which is of great extent, and was appropriated to hunting and the residence of the royal game by William the Conqueror, who established many laws and regulations for the preservation of the deer, that are still observed. In this extensive tract of land are several pleasant towns and villages, of which Wokingham, situated near the centre of the forest, is the principal; and though the soil is generally barren and uncultivated, yet it is finely diversified with hills and vales, woods and lawns, and interspersed with pleasant villas. These rural scenes are finely painted by Mr. Pope, who resided here when he wrote his Windsor Forest, and was himself a native of the place, being born at Binfield.

Here waving groves and chequer'd scenes display,
And part admit, and part exclude the day;
There, interspers'd in lawns and op'ning glades,
'There trees arise, that shun each other's shades.
Here in full light the russet plains extend;
There wrapt in clouds the blueish hills ascend;
Ev'n the wild heath displays her purple dyes,
And 'midst the desert, fruitful fields arise,
That crown'd with tufted trees and springing corn,
Like verdant isles the sable waste adorn.

Among the many fine villas which are in this forest, we shall only here mention Cranborne Lodge, which now belongs to the duke of Gloucester, as keeper of the forest. It is large and well built, and is happily situated, it commanding an extensive prospect over a fine plain, and a rich country, that forms a most beautiful landscape.

Windsor sends two members to parliament, has a weekly market on Saturday, and three annual fairs, viz. Easter Tuesday, for horses and black cattle; the fifth of June, for ditto, sheep, and wool; and the thirteenth of October, for horses, black cattle, and toys.

At Bromehale, in Windsor forest, there was a small Benedictine nunnery, founded in the reign of Richard I. and dedicated to St. Margaret; but being deserted by the abbess and nuns, it was granted by the crown to St. John's college, Cambridge, and still belongs to that seat of learning.

About four miles from Windsor, on the road to Maidenhead, is a village called Bray, supposed by Camden to have been formerly the residence of the Bibraci, a people who submitted to Cæsar, when he crossed the Thames in its neighbourhood. But however that be, it has been long famous for a time-serving vicar, who held the living at the Reformation, and during the reigns of Edward VI. Mary, and part of that of queen Elizabeth; during which period he was twice a Papist, and twice a Protestant: but being afterwards reproached for his want of steadiness and resolution, answered, That his conduct had always been guided by one principle, and which he considered as a very laudable one, namely, "To live and die vicar of Bray." Others, however, will have it, that this famous ecclesiastic was not an Englishman, but enjoyed the living of Bray, in the county of Wicklow, in Ireland, reckoned one of the richest benefices in that kingdom.

Near this village is the duke of Marlborough's island, in which are two elegant temples, erected some years since by the late duke.

Maidenhead is situated on the Thames, about a mile and a half from Bray, and twenty-eight from London. It is said to have been once called South Arlington, or Southeelington, which Stowe has contracted into Sudlington. Various conjectures have been offered with regard to the reason for its having acquired its present name. Some think it obtained this appellation from the head of a British maiden having been kept here, supposed to have been one of the eleven thousand virgins who suffered martyrdom with their leader St. Ursula, near Cologne in Germany, as they were returning from Rome. If this be true, Maidenhead must be a place of considerable antiquity, for the martyrdom of St. Ursula and her eleven thousand attendants, is imputed to Attila king of the Huns, who flourished in the fifth century. But this story of the eleven thousand virgins is a remarkable instance of the gross ignorance and superstitious credulity of the monks; for we are told by Sirman the Jesuit, a writer of great eminence and learning, that in a very ancient manuscript called Martyrology, which he had consulted, there were the following words, "Ursula & Undecimilla, V. V. M. M." Ursula and Undecimilla, virgins and martyrs; and that the monks mistaking the name Undecimilla for *undecem mille*, eleven thousand, had conceived and propagated the ridiculous notion, that eleven thousand virgins travelled and suffered martyrdom with St. Ursula. Other writers, and indeed with a great appearance of truth, tell us, that the original name of this town was Madenhithe, of which Maidenhead is a corruption; and it is certain that it was incorporated by the name of the fraternity or guild of the brothers and sisters of Madenhithe, in the twenty-sixth year of king Edward III. which was about the middle of the fourteenth century; and in the thirtieth of Henry VI. its privileges were confirmed, and several new ones granted. After the Reformation, it was incorporated by the name of Warden and Burgesses, which charter it possessed until the reign of James II. who granted them a new one, by the name of Mayor and Aldermen. We are told by Leland, that in his time, at the west end of the bridge, was a great wharfage for timber and fire-wood, brought out of Windsor forest, and from the great Fryth.

Maidenhead is a great thoroughfare from London to Bristol, and several other places, and on that account is full of inns, for the entertainment of travellers; but had no great repute, till the bridge was built over the Thames, which brought the road from London through the town, before which time travellers passed the river, at a place called Babham-end, where there was a ferry. The bridge (the barge pier of which is the boundary between Berkshire and Buckinghamshire) is maintained by the corporation, who, to enable them to support the expence,

pence, have tolls allowed them over as well as under it; and three trees annually out of Windsor Forest, for repairing it. There is a chapel of ease, founded by Mr. John Husbands, which is an handsome brick building, and stands in the middle of the town: The minister is chosen by the inhabitants, in the common hall; and his income, or the greatest part of it, is raised by subscription. The town hall, built with timber and plaister, under which the market is held, is old and ruinous.

In the year 1589, James Smith, Esq; citizen and falter of London, erected an alms-house in the part of the town which is in Cookham parish; it consists of eight tenements or separate apartments, for eight poor men and their wives, and he endowed it with forty pounds a year, and the Salters company of London are the trustees; besides which, there have been several other donations to the poor of this place.

Maidenhead was last incorporated by a charter from king James II. and is governed by an high steward, a mayor, a steward, ten aldermen, from whom two bridge-masters are annually chosen; two serjeants at mace are also elected yearly; the mayor for the time being is clerk of the market, and coroner; and, together with the preceding mayor and the steward, acts as a justice of peace. There is a gaol for debtors and felons apprehended in the town.

The market is on Wednesday, which is the more frequented from the conveniency of sending goods to London by barges: the three fairs, on Wednesday in Whitsun week, for horses and cattle; the twenty-ninth of September, for the same, and for hiring servants; and on the thirtieth of November, also for horses and cattle.

The adjacent common, called Maidenhead-thicket, from its having been formerly a woody spot, has been long noted for the many highway robberies there committed. The road beyond the town, which was very narrow and incommodious, was considerably widened in the year 1764, by cutting away the hills on each side.

At Hurley, about four miles north-east of Maidenhead, a priory of Black Monks was founded by Geoffrey de Magna Villa, or Mandeville, in the reign of William the Conqueror. It was dedicated to the Virgin Mary, and was a cell to Westminster-abbey. The revenues, at the dissolution, amounted to one hundred and twenty-one pounds eighteen shillings and five-pence *per annum*.

About a mile and a half to the westward of Hurley, is Bisham, where there was a preceptory for the Knights Templars, to whom Robert de Ferariis had given the manor in the time of king Stephen. The templars had granted it away, before their dissolution, to Hugh Spencer, and it afterwards came to William Montacute, earl of Salisbury, who in the year 1338 erected a priory here for canons of the order of St. Augustine, which, at the dissolution of religious houses, was endowed with an annual revenue of two hundred and eighty-five pounds eleven shillings. After the prior and monks had surrendered their monastery, Henry VIII. re-founded it, and endowed it with lands of other dissolved monasteries, to the value of six hundred and sixty-one pounds fourteen shillings and nine-pence *per annum*, for the maintenance of an abbot, who was to enjoy the privilege of wearing a mitre, and thirteen Benedictine monks. But this new institution was of short continuance; for three years after, it was surrendered a second time; and in the second year of Edward VI. it came into a layman's hands. In both the surrenders it is called the conventual church of the Holy Trinity; though in the charter of the original foundation, it was said to be dedicated to our Lord and the Virgin; and in that of the second, to the Virgin only. The church, which is still standing, is a small but neat edifice.

Between three and four miles from Maidenhead, in the Reading road, is the village of Shottesbrook. Here are the remains of a chantry or college, which consisted of a warden, five priests, and two clerks, founded in the year 1337, by Sir William Trussel of Cublesden, knight, and dedicated to St. John the Baptist. The clear annual revenues, at the dissolution, amounted to thirty-three pounds eighteen shillings and eight-pence.

Reading, the next town we visited, is the largest and most considerable town in the county, situated on the Bath road, near the Thames, and on the banks of the Kennet, forty miles from London. Here was a fine church in the early times of christianity, and also a strong castle, in which the Danes fortified themselves, after they had been routed at Ashdom by king Alfred. The Danes abandoned it soon after to the Saxons, who plundered the inhabitants, and almost levelled the town. But the castle continued till the reign of Henry II. who demolished it, as being a place of arms for Stephen's adherents, and there are hardly any vestiges of it now remaining.

This town was formerly famous for the clothing trade; there being no less than one hundred and forty principal clothiers living in it at one time; but this manufacture is at present very inconsiderable, being removed farther to the west. It is, however, a very flourishing town, and contains at least eight thousand inhabitants. Several of the streets are spacious and handsome. Here are three parish-churches, dedicated to St. Mary, St. Lawrence, and St. Giles; three meeting-houses for dissenters, and one for the Quakers. It has a considerable country trade, but its chief traffic is to London, sending thither large quantities of malt, meal, and timber; and receives in return, coals, salt, tobacco, grocery wares, oil, and other necessary commodities.

Reading is governed by a mayor, twelve aldermen, and twelve burgeses, by whom, with the commonalty; their representatives are elected. Sir Jacob Astley had the title of baron of Reading granted him in the reign of Charles I. it was afterwards conferred upon general Cadogan, created earl of Cadogan, &c. on whose death it expired. The manor of the town was settled by king James I. after the death of his queen, on prince Charles his second son, afterwards Charles I. but is now vested in the corporation.

In the year 1643, Reading was besieged and taken by the parliament's forces, commanded by the earl of Essex, consisting of sixteen thousand foot and three thousand horse: Sir Arthur Aston, being governor, with a garrison of three thousand foot and three hundred horse. The governor was wounded in the head at the beginning of the siege, whereupon the command devolved on colonel Richard Fielding. As soon as the king heard the town was invested, he detached commissary Wilmot, with a body of horse, who found means to throw in an auxiliary party of five hundred men, and some powder; but however, Fielding not thinking this relief sufficient, demanded to capitulate, and a truce was agreed upon. In the mean time, the king advanced with his army from Oxford to relieve the place, and detached Ruthven, his general, lately created earl of Bath, who, with a thousand musqueteers, vigorously set upon lord Roberts's and Buckeley's regiments, who defended Caversham-bridge, hoping the garrison would second his attempt; as he was ignorant of the truce; but finding no assistance from them, he retreated to the main army; and Fielding found means to wait upon his majesty in the night, told him, he hoped to have liberty to march out with all his arms and baggage, and the king consenting, next day the capitulation was signed, and the town surrendered.

In the year 1688, an alarm began at Reading, which instantaneously spread through the whole kingdom, that the Irish disbanded soldiers of king James's army were ravaging and murdering wherever they came: every town believed the next to it was actually in flames; and such a panic was raised, that every one was up in arms to defend himself: this was called *the Irish-cry*. About the same time, was a skirmish between a party of the prince of Orange's, and another of king James's troops, in which the latter were repulsed with little bloodshed. This skirmish gave occasion to the famous ballad of Lilliburlero, and the day is still commemorated by the inhabitants.

Within less than a furlong to the south-west of this town, and about four hundred yards from the river Kennet, is a very remarkable natural curiosity, on a rising ground, called Cats-grove-hill, which is a stratum of

Oyster-shells, on a bed of green sand, under which is an hard rocky chalk: this stratum of shells runs through the hill, which is from forty to sixty feet in perpendicular height, many hundred yards. When these oysters are taken out, they have the appearance of real ones; the opposite valves being closed, as in their natural state, and in the usual form. When opened, the fish appears to be perfect, and the shell not in the least petrified; but when exposed to the air, crumbles with the smallest pressure.

Reading sends two members to parliament, has a weekly market, very well frequented, on Saturday; and four annual fairs, viz. the second of February, for horses, cattle, and pigs; the first of May, and the twenty-fifth of July, for horses and cattle; and the twenty-first of September, for cheese, horses, cattle, and hogs.

A nunnery was founded in this town about the year 980, by Elfrida, the widow of Edgar, and mother-in-law to Edward the Martyr, who was killed by order of Elfrida; and she built this nunnery, with several others, to expiate the murder. About the year 1121, Henry I. laid here the foundation of a very stately abbey, which was finished in about four years, and endowed for the maintenance of two hundred monks of the Benedictine order: and soon after the endowment of this abbey, the nunnery founded by Elfrida was suppressed, and the land given to the monastery. The founder himself, together with his queen, and their daughter, the empress Matilda, or Maud, mother to Henry II. were buried here. This abbey was dedicated to the honour of the Holy Trinity, the blessed Virgin, St. James, and St. John the Evangelist, and it is said to have been equal to most in England, for its magnificent structure and great riches. The abbots being mitred, sat in the house of peers; and the church of Pagburn, by the Thames, two miles south-east of Baselden, was their summer residence. The last abbot, Faringdon, was drawn, hanged, and quartered, at Reading, and two of his monks, for high treason, in refusing to surrender it on the demand of the visitors, some time after the Reformation. Camden acquaints us, that in his time, it was converted into a royal seat, adjoining to which was a stable for the king's horses; very probably all demolished in the civil war. It was valued, at the dissolution of monasteries, at one thousand nine hundred and thirty-eight pounds, fourteen shillings and three-pence. There are still some vestiges of this structure remaining. The walls are principally composed of flint; and though the free-stone facings have been removed, they are now near eight feet thick, and the cement employed in joining the stones is remarkably hard. There is still to be seen a large room, near sixteen yards broad, and twenty-eight long, semi-circular, with five narrow windows towards the east, and three doors towards the west, with three windows over them: it was arched over, and seems to have supported a chapel in which Dr. Stukely supposes the royal personages above-mentioned were buried; and that the arched vaults supported the hall, lodgings, and other apartments. Near the abbey is an artificial mount called Forbury-hill, which is very pleasant, and has been lately repaired by a voluntary subscription of gentlemen and ladies. Hence you have a delightful prospect of the Thames, of the Oxfordshire hills and woods, on the opposite side of the river, of the neighbouring villages, and of the fertile vale through which it flows.

Not far from the church of St. Laurence was an almshouse for poor sisters, which, in the reign of Henry VII. was made a free-school; and about the year 1134, one Auferus, or Aucherius, the second abbot of Reading, founded an hospital for twelve leprous persons, besides chaplains, situated near the abbey, and dedicated to St. Mary Magdalen. About the year 1190, Hugh, the eighth abbot, founded in the same neighbourhood an hospital for twenty-six poor people, and the refreshment of travellers and strangers, and obtained the church of St. Lawrence to be appropriated towards the better support of this charitable foundation.

Some time before the year 1400, a house of Grey Friars was built on the north side of Castle-street; but

the site of it being afterwards granted to the corporation, it was converted into a house of correction.

About three miles north-east from Reading, and on the banks of the Thames, is a village called Sunning, remarkable for an old chapel formerly resorted to by pilgrims for the cure of madness. This place was once the see of a bishop, whose diocese contained this county, and that of Wilts. Leland says, that nine bishops successively filled this see, the first of whom was Ethelstan, and the last Hermanus, who removed the see to Sherburn, from whence it was afterwards translated to Salisbury; and the bishop of that diocese is still lord of the manor.

Ockingham, or, as it is sometimes called, Wokington, is situated about five miles south-east of Reading, and thirty-three west of London. It is a corporation governed by an alderman, recorder, and capital burgesses. The town consists of several streets, and has a market-house in the middle, not ill built. Here is a parish-church, a free-school, and an hospital founded by Henry Lucas, Esq; in the reign of Charles I. for sixteen pensioners, who have each ten pounds a year. The hospital has also a chaplain, who is called master, and has a stipend of fifty pounds a year. The trustees of this charity are the Grocers company in London, who elect the chaplain; but the pensioners are presented alternately by thirty-three parishes, sixteen of which are in Berkshire, and seventeen in Surry. Here is a manufacture of silk stockings, and another of cloth, but the former is in a more flourishing condition than the latter.

Here is a weekly market on Tuesday, and four annual fairs, viz. the Thursday after Shrove Tuesday, the twenty-second of June, the tenth of September, and the twelfth of November, for horses, cattle, and toys.

The country, on both sides of the road, between Reading and Newbury, is adorned with several elegant seats, commanding delightful prospects, the country being finely diversified with woods and lawns, meadows, and arable fields.

Newbury is situated in a fertile plain on the river Kennet, fifty-six miles from London. It owes its increase of buildings and inhabitants to the woollen manufacture, which was formerly so flourishing, that John Winschomb, commonly called Jack of Newbury, was considered as the greatest clothier in England in the reign of Henry VIII. He kept an hundred looms constantly at work in his own house, which, in the last century, was entire, but is now divided into several tenements. The town has also lost most of its cloathing trade, though there are still manufactures for shalloons and druggets. Broad-cloths are also still made here, but in small quantities.

The streets are broad and open, and the market-place spacious, containing an old market-house built of timber, lath and plaister, in which the flesh-market is held. Near it is a noble town-hall, where the business of the corporation is transacted. The church is also situated near the town-hall, and is a noble edifice.

The town was incorporated by queen Elizabeth, and is governed by a mayor, aldermen, and burgesses. Here is a charity-school for forty boys, endowed with forty pounds a year by the corporation, and twenty-five pounds a year by the benefaction of a private person.

There is here also an almshouse, said to have been originally founded by king John, for twelve poor persons, six men and six women.

Newbury has a considerable market for corn, held on Thursday; and four annual fairs, viz. Holy Thursday, and the fifth of July, for horses, black cattle, and hogs; the third of September, and the twenty-eighth of October, for cheese and horses.

On each side of the Kennet, near Newbury, is a stratum of peat, about a quarter of a mile wide, and several miles long. Peat is a composition of the branches, roots, and leaves of trees, intermixed with grass, straw, and weeds, which having lain long in the water, are formed into a common mass, so soft as to be cut through with a sharp spade. This substance, which is used as fuel, is of a blackish brown colour, and found here, from one to eight feet below the surface of the earth.

Great

Great numbers of trees are found lying irregularly in the peat, consisting chiefly of oaks, elders, willows and firs, and appear to have been torn up by the roots. Many horns, heads, and bones of several kinds of deer, the horns of the antelope, the heads and tusks of boars, and the heads of beavers, are also found among the peat. Not many years ago, an urn of a light brown colour, large enough to hold about a gallon, was found in the peat pit near Newbury, about ten feet distant from the river; but the urn being broke to pieces by the peat-diggers, who found it, the opportunity of examining it critically was lost, nor can it be known whether it contained any thing. Great quantities of peat are burnt in the neighbourhood, and the ashes sold to the farmers for manuring their lands.

About a mile to the northward of Newbury, is Donnington-castle, situated on the river Lambourne. This fortress, which is now in ruins, commands a very beautiful prospect, and is said to have been built by Sir Richard Abberbury, Knt. in the reign of Richard II. and is chiefly remarkable for being the residence of Geoffrey Chaucer, the father of English poetry. Sir Richard also built and founded a priory for friars of the order of the Holy Trinity, at a small distance from the above castle. This religious house subsisted till the dissolution, when its annual revenues were valued at nineteen pounds thirteen shillings and nine-pence. He also erected and endowed an hospital here, called God's House, for a master and twelve poor men. This structure is still standing, and each of the pensioners receive annually six pounds thirteen shillings and four-pence; and every seventh year, when the lease is renewed, almost double.

Two miles to the westward of Newbury, are two villages, called East and West Embourne, remarkable for the following singular and whimsical custom of the manor. The widow of every copyhold tenant is entitled to the whole copyhold estate of her husband, so long as she continues unmarried and chaste; if she marries, she loses her widow's estate without remedy; but if guilty of incontinence, she may recover her forfeiture, by riding into court, the next court-day, mounted on a black ram, with her face towards the tail, and the tail in her hand, and repeating the following lines:

Here I am, riding on a black ram,
Like a whore as I am;
And for my crinum crancum,
Have lost my bincum bancum,
And for my tail's game,
Am brought to this world's shame,
Therefore, good Mr. Steward, let me have my lands again.

In the neighbourhood of Newbury, two very remarkable battles were fought in the civil war between king Charles I. and his parliament. The first happened on the twentieth of September, 1643, when prince Rupert, with his horse, soon routed the parliament's cavalry; but charging the infantry, they so bravely defended themselves with their pikes, that he was forced to wheel about. The battle continued the whole day, with nearly equal success; but at night the king drew off his forces, and permitted the earl of Essex to enter the town, and pursue his march towards London. In this conflict fell, on the king's side, the earls of Sunderland and Carnarvon, the accomplished lord Falkland, and many others of great note.

The second battle was fought on the twenty-seventh of October, of the following year, in which the parliament's forces gained the victory. The king had secured his troops, by placing his foot in the intrenchments, and posting his horse in two adjoining fields. Several days before the battle, the two armies had many smart skirmishes; but at length, on the beforementioned day, being Sunday, the parliament generals formed their army into two divisions, the general's horse and foot, part of Manchester's horse, most of Waller's forces, with the city brigade marching to Speene-hill, and the earl of Manchester's foot, with part of his horse, continued on the field, near Shaw. The horse were commanded by

Sir William Waller, and Sir William Balfour, and the foot by serjeant-major-general Skippon. The battle lasted from three or four o'clock in the afternoon, till night, with various success; but at length the king's forces were beat from their trenches, and afterwards from their ordnance, with the loss of three thousand men, and the enemy lost two thousand five hundred. The king's army consisted of eight thousand foot and five hundred horse, and that of the parliament of sixteen thousand, horse and foot.

Hungerford, a small market-town situated on the borders of Wiltshire, and on the banks of the Kennet, sixty-four miles from London. It stands in a low swampy soil, on the great road to Bath, and is governed by a constable chosen yearly, and who is lord of the manor, which he holds immediately of the king, for the time being. Neither the buildings nor its market are now considerable; but it is remarkable for having the best trout, eels, and cray-fish in the kingdom. It has a small weekly market on Wednesday, and a yearly fair on the twenty-first of August, for horses, cows, and sheep.

Seven miles north-west of Hungerford, and sixty-six from London, is Lower Lambourne, so called from the little river Lambourne, which rises in its neighbourhood. It is a place of great antiquity, having belonged to Alfrith, cousin to king Alfred, who bequeathed it to him by his will. The church is an ancient structure, and on the north side of it is an hospital for ten poor men, six of whom are nominated by New College, Oxford, and four by the family of Hippefly, in Lambourne. It was built and endowed by John Ilbury, Esq; in the year 1502, and the pensioners have among them two and twenty shillings a week, three loads of wood, a certain quantity of wheat and malt yearly, and a share of the fine paid every seventh year for a renewal of the lease. The town is pleasantly situated in an open country, has a weekly market on Thursday, and three annual fairs, viz. the twelfth of May, the second of October, and the fourth of December, for horses, colts, cows, boots and shoes.

At Ellenfords-mere, in the parish of Chaddleworth, near Lambourne, there was an hermitage in very early times; and in the year 1160, Ralph de Chaddleworth erected a priory on the spot where the hermitage stood, for regular canons of the order of St. Augustine, and dedicated it to St. Margaret. This priory was afterwards called Poghele, and in the time of Edward IV. was endowed with fifty pounds *per annum*. It was one of the smaller monasteries dissolved by cardinal Wolsey, at which time the annual value amounted to seventy-one pounds ten shillings and seven-pence.

About two miles to the north of Lambourne, is White Horse Hill, on the summit of which is a large Roman intrenchment, called Uffington-castle, from its overlooking the village of Uffington in the adjacent valley. And a little below this fortification, on the steep side of the same hill, facing the north-west, is the figure of a white horse, the dimensions of which are extended over about an acre of ground. Its head, neck, body and tail, consist of one white line, as does also each of its four legs. The lines are formed by cutting trenches in the chalk, two or three feet in depth, and about ten feet in breadth. The chalk of the trench being of a brighter colour than the surrounding turf of the hill, the whole figure, when the mid-day sun darts his rays on it, is visible at more than twelve miles distance. A white horse is known to have been the Saxon standard, and some have thence supposed, that this figure was made by Hengist, one of the Saxon kings. But Mr. Wise, the author of a letter on this subject, addressed to Dr. Mead, and published in 1738, brings several arguments to prove, that this figure was formed by order of Alfred, during the reign of Ethelred his brother, as a monument of his victory gained over the Danes in the year 871, at Ashdown, now called Ashen, or Ashbury Park, the seat of lord Craven, near Ashbury, not far from this hill. Others, however, suppose it to have been partly the effect of accident, and partly the work of the shepherds, who observing a rude figure somewhat resembling

sembling a horse, as there are in the veins of wood and stone, many figures that resemble trees, caverns, and other objects, reduced it by degrees to a more regular figure. But however this be, it has been a custom immemorial for the neighbouring peasants to assemble on a certain day about Midsummer, to clear away the weeds from this white horse, and trim the edges, to preserve its colour and shape, which they call "scowering the horse;" after which the evening is spent in mirth and festivity.

To the north of this hill there is a long valley, extending to the western side of the county, where it borders upon Wiltshire, as far as Wantage, which from this hill is called the Vale of White-horse, and is the most fruitful part of the county.

Near White-horse hill, above the source of the river Ocke, there is an ancient camp, which is supposed to be Danish from the works being single. The diameter is about an hundred paces, and the figure a kind of quadrangle, with the corners cut off. The works were some time ago almost defaced, by digging for stones called Farsden stones, to build a house for lord Craven in Ashbury-park.

At the distance of about a mile from the above hill, there are many large stones, some of them standing on their edges, which appear to have been brought thither with some design, though they are now in great confusion and disorder. Mr. Wise supposes they were originally set up as a funeral monument for a Danish king, slain in the battle of Ashdown. He imagines that the whole formed originally an oblong square, extending directly north and south; and on the east side of that part, which is thought to have been the southern extremity, there are two square flat stones, about five feet over each way, set on edge, and supporting a third of a much larger size, which lies flat upon them. This is thought to be a sepulchral altar, on which sacrifices were annually offered in honour of the dead. We have already described several of these monuments of antiquity in our account of Cornwall, where they are called Cromleches.

The country people call this place Wayland Smith, from a fabulous tradition, that it was once the dwelling of an invisible smith; and that if a traveller's horse had lost a shoe upon the road, he need only bring his horse to this place, with a piece of money, and, leaving both there for a short time, at his return he would find the money gone, and his horse new shod.

About a mile from hence is a remarkable place called the Seven Barrows; but though this be the common term, the number is not so few as seven, nor are there seven more remarkable than the rest; for Mr. Wise counted no less than twenty, within the compass of six or seven hundred yards. Here he supposes the nobility slain in the battle of Ashdown were interred. These barrows are of various forms; there is one long, and two or three, which Dr. Stukeley calls Celtic, with a ring of earth a little raised above the level, and inclosing a piece of ground with a small eminence in the midst.

It was the Danish custom, and that of other northern people, to sacrifice some favourite animal to the manes of the deceased, which generally accompanied the body, whether buried or burned. In one of these barrows, lately dug up, between Weyland-Smith and Wantage, were found, beside a human skeleton, the horns of a stag, probably buried with the deceased, on account of his having been fond of hunting.

At the foot of White-horse hill, and almost directly under the horse, is a large barrow, which the common people thereabout call Dragon-hill; and their tradition is, that "here St. George killed the dragon." They show besides a bare place on the top of it, which is a plain about fifty or sixty yards over, where the turf does not protrude, which they say proceeds "from the venomous blood that issued from the dragon's wound." That this was a funeral monument can hardly be doubted, and it is more than probable it was erected by the Britons, to the memory of one of their kings who was killed in battle. And this it is most likely was the case, as the Britons did not give up this country till the close of the

sixth century. One battle was fought so late as the year 581, at Wanborough, about five miles from this place, wherein the Britons were conquerors. Before, in the year 577, three British kings were slain at Deorham, in Gloucestershire; and three towns taken from the Britons, Gloucester, Bathonchester, and Cirencester, the last of which is about fifteen miles from Dragon-hill. In the year 556, Cynric and Ceawlin overcame the Britons at Beranbury, which the learned commentator on Camden supposes to be Barbury-castle, about five miles from this place; nor is it improbable that the battle of Mons Badonicus, mentioned by Gildas, Bede, and Nennius, was fought somewhere in this neighbourhood. This last battle happened, according to the best accounts, in the year 520. These, with many others, were the reasons that induced Mr. Wise to think Dragon-hill was the burial-place of some British chief, who fell in one of the last struggles for the liberties of his country, fighting, in all probability, against the West-Saxons, whose kingdom extended into these parts.

Farringdon, or Farrendon, is a small, but neat market-town, pleasantly situated on a hill, near the river Ouse, sixty-five miles from London. The church is a large handsome structure, and here was formerly a castle built by Robert earl of Gloucester, but demolished by king Stephen; who on the site of it founded a priory, the monks of which were subordinate to the convent of Beaulieu in Hampshire. The market is held on Tuesday; besides which, there are three annual fairs, viz. the second of February, and Whitfun Tuesday, for horses and fat cattle; and the eighteenth of October, for horses, cattle, and pigs.

From Farringdon we returned, through the fruitful vale of White-horse, to Wantage, which may be considered as the capital of that rich valley. It is a neat town, situated on a branch of the river Ocke, in a fine sporting country, fifty-nine miles from London. In the time of the Saxons it was a royal villa, and is still famous for being the birth-place of king Alfred, who bequeathed it, by his will, to Alfrith his cousin. Here is a weekly market on Saturday, and three annual fairs, viz. the first Saturday in March, the eighteenth of July, and the seventeenth of September, for horses, cows, calves, hogs, cheese, and hops.

Near this place there is a Roman work, called Ickleton-way; it is continued to the sea, and is part of the Ickinild Street.

East Illey is situated near the middle of the county, in a fine sporting country, and in the road from Oxford to Newbury, fifty-four miles from London. Here is a weekly market on Wednesday, famous for sheep, of which vast numbers are fed on the surrounding downs. Besides which, there is an annual fair on the sixth of August, for sheep and lambs.

At Aldworth, a village about three miles to the east of Illey, was formerly a castle belonging to certain knights of the family of de la Beche, which has been extinct ever since the reign of Edward III. but notwithstanding this, there is a farm in the neighbourhood, still called Beche farm; and in the church are nine antique monuments, on which are the figures of the persons whose memories they were intended to commemorate, in a recumbent position. Five of these are supposed to have been knights templars, from their being dressed in armour, and lying with one leg across the other. But the other four are so mutilated, that it is now impossible to be known whether they were of the same order or not. These statues being much larger than the life, are supposed by the common people to be the memorials of a race of giants. In the church-yard is one of the finest yew-trees in England, the trunk or stem, at four or five feet above the surface of the ground, being twenty-seven feet in circumference. The tree rises tapering to a very considerable height, and the branches extend every way three or four and twenty feet from the trunk.

Wallingford, an ancient borough by prescription, is situated on the river Thames, over which there is a stone bridge three hundred yards in length, and supported by nineteen arches, forty-six miles from London. This place is supposed by Camden to have been the chief city

city of the Attrebatii; but bishop Gibson is of opinion, that Henly upon Thames was the capital of that ancient people.

But however that be, Wallingford was once surrounded by a wall and ditch, the traces of which are still visible, and are more than a mile in circumference. Here are the shattered remains of a castle, supposed by Camden to have been originally built by the Romans; and after it had been ruined by the Saxons and Danes, during the contest between them, to have been rebuilt by William the Conqueror. There is indeed very good evidence that a castle was erected here by the Conqueror, it being recorded in Doomſday-book, that eight houses in Wallingford were destroyed in order to build this fortress. It was seated on the banks of the Thames, and defended by a double wall and three ditches, very wide and deep, which were always full of water. In the centre was a tower built on the summit of a very high mount, in the steep ascent of which Camden tells us he saw a well of remarkable depth. It was several times besieged by king Stephen during his contest with Henry II. but never taken by him. It came afterwards into the hands of Richard earl of Cornwall, the younger brother of Henry III. who thoroughly repaired it. At present the site of this ancient castle belongs to Christ-church college at Oxford; as it did also in Camden's time, when it was a retiring place for the students of that seminary.

The town is large, and has a good appearance. It has two principal streets, in one of which the market is kept, in an elegant and well-built market-house, over which is the town-hall, where the sessions are held, this being a particular jurisdiction. It was incorporated by a charter from James I. and is governed by a mayor, a high steward, a recorder, six aldermen, a town-clerk, two bailiffs, a chamberlain, and eighteen burgesses or assistants. There is only one church now remaining out of fourteen which were formerly here. This structure is venerable for its antiquity, and dedicated to St. Mary. The chief manufacture in this town is malt, which is sent by water to London.

This town sends two members to parliament, and has two weekly markets, held on Tuesday and Friday, but the latter is the most considerable. Besides these markets, here are four annual fairs, viz. Tuesday before Easter, for toys; the fourteenth of June, for horses; the twentieth of September, for hiring servants; and the seventeenth of December, for fat hogs.

Here was formerly a convent of black monks, subordinate to the great abbey of St. Albans, to whom the church of the Holy Trinity in this town had been given by Galfridus Camerarius. There were also a dean and prebendaries in a chapel, called the King's Free-chapel, situated within the walls of the castle, and dedicated to St. Nicholas. It was endowed by Edmund earl of Cornwall, in the tenth year of Edward I. for the support of a dean, six chaplains, six clerks, and four choristers. Its revenues were augmented by Edward the Black Prince, and Henry VI. so that at the dissolution, the yearly value was one hundred and forty-seven pounds, eight shillings.

There was also in this town a religious society, called the Master, Brethren, and Sisters of the Hospital of St. John the Baptist. It was instituted before the time of Edward I. and the house, which stood without the south gate of the town, had an annual revenue of six pounds.

On a lofty eminence in the neighbourhood of Wallingford, called Sinodun Hill, which is still surrounded by a deep ditch, there was, in ancient times, a Roman fortification; and whenever the ground is ploughed, Roman coins are thrown up.

At Chofely, about a mile from Wallingford, there was a monastery, founded about the year 980, by king Ethelred, son to Edgar, by Elfrida, to make some atonement for the murder of his brother, Edward the Martyr. But this structure was destroyed, together with the town, in the contest between the Danes and Saxons, about the year 1006.

This place is however still famous for a farm called Chofely Farm, supposed to be the largest in England;

the lands, which lie all together, being let at one thousand pounds a year; and there is one barn on the estate, the roof of which is three hundred and six feet long.

Abington, the county town, so called from an abbey anciently erected there, is situated on the river Thames, often called the Isis, over which there is a stone bridge, fifty-five miles from London. It was made a free borough, and incorporated by queen Mary I. and is governed by a mayor, two bailiffs, and nine aldermen, who had formerly the sole right of choosing one member to represent the borough in parliament; but the election is now in the inhabitants, paying scot and lot. The summer assizes are always held here, as the winter are at Reading.

The streets are well paved, and terminate in a spacious area, where the market is held. In the centre of this area there was formerly a cross of excellent workmanship, said to have been built in the reign of Henry VI. by the fraternity of the Holy Cross, of which that prince was the founder. This cross, among other more valuable remains of the taste and ingenuity of our ancestors, was destroyed in the civil wars of the last century. The spot on which this cross formerly stood, is now occupied by the market-house, a curious building of ashler-work, supported by lofty pillars. Above is a spacious hall, where the assizes are held, and other public business transacted. It has two churches, one dedicated to St. Helena, and the other to St. Nicholas, and both are said to have been built by one of the abbots of Abington. The former has a lofty spire, with eight tuneable bells, cast in the year 1764. It has also two hospitals, one for six, and the other for thirteen poor men and women; a free-school, and a charity-school. The principal produce of the adjacent country is barley, and malt the chief manufacture of the town. Several barges are also employed in conveying the above commodity, with other goods, to London.

This town sends one member to parliament, has two weekly markets, held on Monday and Tuesday; and four annual fairs, viz. the first Monday in Lent, the twentieth of June, the nineteenth of September, and the eleventh of December, all for horses, and other cattle.

It is said by some historians, that there was an abbey of five hundred monks at Abington, so early as the British or Roman times; and that in this abbey Constantine the Great received his education; but of this there is no very authentic testimony. It is, however, pretty certain, that in the Saxon times, about the year 675, a small monastery was founded upon a hill in Bagleywood, two miles nearer to Oxford than the town now called Abington, by Cissa, who was then viceroy of Wiltshire, and great part of Berkshire, under Ketwin, king of the West Saxons, at the request of Hearne, his nephew, who became the first abbot. About five years after, this monastery, for some reason which cannot now be discovered, was removed to Sheovisham, or Sevekisham, which, from that time, was called Abington. The celebrated monastery at Abington was built and endowed by the munificence of Cedwalla and Ina, kings of the West Saxons, and was afterwards destroyed by the Danes. About the year 955, it was rebuilt by the care of Ethelwold the abbot, who was afterwards bishop of Winchester, and by the bounty of king Edred and king Edgar. The abbey was dedicated to the Virgin Mary, and the monks were of the order of St. Benedict. In the church of this abbey were the tombs of Cissa its founder, and many other eminent persons, particularly Geoffrey of Monmouth, the historian, who was one of its abbots; but all these monuments, together with the church, and many other buildings that belonged to the abbey, were destroyed at the dissolution, when, according to Burton, the revenues were valued at two thousand and forty-two pounds *per annum*; but Dugdale says, at not more than one thousand eight hundred and seventy-six pounds ten shillings and nine-pence.

Near the spot where the church of St. Helena now stands, was a nunnery, built about the year 690 by Cissa or Cilla, niece to Cissa the founder of the monastery, and sister to Hearne, the first abbot. Cilla herself was the first abbess of this nunnery, and the house

was then called Helenflow. After the death of Cilla, the nuns removed higher up the Thames to a place called Witteham, or Wytham, where they continued till about the year 780, when the war broke out between Offa, king of the Mercians, and Kinewulf, king of the West-Saxons. Abingdon, being a frontier town, was made a garrison, and the nuns were obliged to retire to other religious houses, whence they never returned.

At Stiventon, near Abingdon, there was an alien priory of black monks, being a cell to the abbey of Bec, in Normandy. On the dissolution of foreign priories, it was granted to the dean and chapter of Westminster.

Curious PLANTS found in Berkshire.

Penny-royal, *Pulegium vulgare*, *J. B.* found on the borders of springs, and other watery places in several parts of this county, particularly near the sources of the Ocke and Lambourne.

Mugwort, *Artemisia vulgaris*, *J. B.* found in uncultivated places, near the way-side in various parts of this county, particularly in the neighbourhood of Wantage.

Cat-mint, *Nepeta majore vulgaris*, *Park*, found in watery places near the Thames.

Calamint, *Calamintha vulgaris, flore magno*, *J. B.* found in several parts of the county under hedges by the road-side, in dry places, particularly about East Ilsley.

Common Wormwood, *Abysinthium majus vulgare*, *J. B.* found in many uncultivated places in different parts of the county.

Horse-mint, *Menthastrum*, *Ger.* found on the borders of ponds and ditches in many places, particularly in the neighbourhood of Hungerford.

Hoarhound, *Marrubium album vulgare*, *C. B.* found near Wantage, and several other parts of the county.

Hedge-mustard, *Erysimum vulgare*, *J. B.* found in plenty by the way-sides, near Ockingham, and several other places.

Scordium, *Scordium vera*, *C. B.* found in the moist and marshy grounds near the Kennet, but not very common.

Ground Pine, *Chamaepitys odora lutea*, *Ger.* found on some of the hills surrounding the vale of White-horse, and by the road-side near Wantage.

Wood Betony, *Botonica purpurea*, *C. B.* found in several shady parts of Windsor forest.

Fluellin, *Elatine folio subrotundo*, *C. B.* found in great abundance in many of the corn-fields of this county, especially in the vale of White-horse.

Wood Sorrel, *Luzula vulgaris*, *J. B.* found in several parts of Windsor forest.

Hedge Hyssop, *Digitalis minima Gratiola dicta*, *Morrison*, found in plenty near the banks of the Ocke.

Purging Flax, *Linum pratense floribus exiguis*, *C. B.* found on the upland pastures near East Ilsley.

Spurge Laurel, *Thymelæa lauri folio*, *Ger.* found in some of the woody parts of Windsor forest.

Pimpernel, *Anagalis mas*, *Ger.* found in the corn-fields in most parts of the county.

Cranes Bill, *Geranium Robertianum*, *J. B.* found in the woody parts of Windsor forest.

ROMAN COINS, and other ANTIQUITIES, found in Berkshire.

Besides the antiquities we have mentioned in describing the places where they were discovered, we shall add, that at Reading several coins of great antiquity have been dug up, particularly one of gold, and another of brass, so ancient, that bishop Gibson tells us, he could not learn to what people they belonged.

At Laurence Waltham, near Reading, several Roman coins have been dug up; and the foundations of a Roman fort are still to be seen there.

On St. Leonard's Hill, near Windsor, many ancient coins, instruments of war, and lamps, have been dug up.

At East Hampstead, not far from Ockingham, are the traces of a large Roman camp, commonly called Cæsar's Camp.

MEMBERS of PARLIAMENT for Berkshire.

This county sends nine members to parliament, two knights of the shire for the county, two burgessees for New Windsor, two for Reading, two for Wallingford, and one for Abingdon.

O X F O R D S H I R E.

OXFORDSHIRE is bounded, on the east by Buckinghamshire; on the west by Gloucestershire; on the north by the counties of Northampton and Warwick; and on the south by Berkshire. It is forty-two miles in length, twenty-six in breadth, and one hundred and thirty in circumference, containing an area of six hundred and sixty-three square miles, or five hundred and thirty-four thousand acres. It is divided into fourteen hundreds, in which are two hundred and eighty parishes, one city, twelve market-towns, about nineteen thousand seven hundred houses, and one hundred and twenty thousand souls. It lies in the province of Canterbury, and diocese of Oxford. Woodstock, a borough town near the centre of the county, is sixty miles distant from London.

R I V E R S.

The principal rivers of this county are, the Thames, or Isis, the Charwel, the Evenlode, the Windrush, and the Tame. An account of the name and origin of the Thames, or Isis, has been already given in the description of Berkshire, and its course has been traced in our description of other counties through which it flows. The Charwel rises in Northamptonshire, enters Oxfordshire near Cleydon, a village on the northern extremity of the county; whence it runs to the south, by Banbury, and a great number of villages, and falls into the Thames or Isis, a little below Oxford. The Evenlode rises in the north-east part of Worcestershire, near a town of its own name, not far from Stow in the Wold, a market-town in Gloucestershire; and running south-east, enters Oxfordshire not far from the shire stones; and passing by Chalbury, falls into the Thames about four miles above Oxford. The Windrush rises in Cotswold hills, in Gloucestershire; and running south-east, enters Oxfordshire not far from Burford, a market-town; and passing by Witney, another market-town, falls into the Thames at North-moor, a village about five miles to the west of Oxford. The Tame rises in Buckinghamshire, touching the borders of Oxfordshire at a town of its own name, whence it runs westward for some miles, forming a boundary between these two counties; and then directing its course to the southward, falls into the Thames a little below Dorchester.

Besides the rivers above enumerated, Dr. Plat, who wrote a natural history of Oxfordshire, reckons there are no less than seventy considerable, though inferior streams, which water this county.

Remarks on the INLAND NAVIGATION of Oxfordshire.

The only navigation in this county is that of the Thames, which has been already described in our account of Berkshire. But an act was passed in the last sessions of parliament, for making a navigable canal to communicate with that making from the city of Coventry to the great Staffordshire navigation; and to pass through the several parishes, hamlets, or places, of Stoke, Binley, Comb, Brinklow, Long Lawford, Newbold, Brownsover, Clifton, Hillmorton, Barby, Wiloughby, Braufon, Wolfthamcote, Lower Shucksburgh, Napton-Priors, Marston-Priors, Hardwick, Wormleighton, Fenny Compton, Burton-Dassett, Warmington, Shotswell, Mollington, Horley, Nethorpe, and Banbury; and thence through Adderbury, Deddington, North Aston, Middle Aston, Steeple Aston, Rousham, Shipton, Woodstock, Bladen, Begbrook, Yarnton, and Midvercot to the city of Oxford, communicating with the navigation of the river Thames.

There is an inexhaustible bed of coals in Warwickshire, which, by means of navigable canals, might be brought into circulation, make firing cheaper all over the kingdom, and enable our present collieries to serve foreign markets, without distressing the poor tradesman and manufacturer in the metropolis and other places. For want of such a canal, the collieries in Warwickshire cannot be worked; because a land-carriage cannot be obtained at any rate, to bring them to market. Ought this mine of riches to lie buried in the earth, because private interest clashes with public emolument, or fanciful chimeras perplex the brains of some shallow-headed servants of the public? Is it not demonstrable, that the present high prices of all provisions will be reduced by the increased quantity of coals brought to market? It is not necessary to stay for an answer; the fact is demonstrable.

It is also evident, that an increase of land-carriage (which must be increased, or else coals from Warwickshire, Oxford, Northampton, or Bedford, cannot be had to supply the demands of the inhabitants) will raise the price of all provisions whatever. People affect to talk about the nursery for seamen; but let them consider whether the arguments drawn from that topic are not only in themselves weak and inconclusive, but really founded upon principles which stand in direct opposition to truth? Whether the high prices of provisions, and particularly of fuel, do not tend to depopulation? And whether the number of hands now employed in wood-stealing, hedge-breaking, &c. might not be applied to better purposes? Take this maxim into the account, if the king wants subjects, he must want seamen. Shall we go further, and say, whoever opposes inland navigation, virtually opposes plenty and population?

The arguments against the Coventry canal were chiefly these: that it may affect the coasting trade, and so lessen the number of seamen; that it may lower the price of Newcastle coals; that it will consume a great quantity of land, and must injure the proprietors over whose estates it shall pass, and that the tonnage will not pay the subscribers one *per cent.* for their money. As the last objection so manifestly contradicts the two first, perhaps the advocates for this navigation will admit it in its utmost force. Who then can enough applaud the public spirit of these subscribers, who, at such great disadvantage, are willing to undertake a work for the sake of supplying their poor neighbours with one of the most important necessaries of life? But it is hoped the navigable canal will prove beneficial even to the undertakers, and will reduce the exorbitant price, not only of Newcastle coals, but even of fuel in general, all over the kingdom. The Newcastle coals, for their superior quality and fitness for particular trades, will always be in demand; and indeed, upon repeated experiments, it hath been proved, that seventy-five pounds of good Newcastle coals will go as far, even in culinary business, as one hundred and twelve of the best Wedgeberry. However, the Wedgeberry coals, and those from the Coventry pits, will answer almost all purposes (excepting where charcoal is required) better than any sort of wood; and the destruction of wood for fuel is, perhaps, one of the most capital evils which this canal is sure to remedy. Our ancestors made wise laws for the encouragement of the growth of timber; but we now find so good a market for fuel, that we pay little regard to those laws, cutting down saplings and young sprigs, even for faggot wood, and planting none but such as will soon turn to fuel. So beneficial will the canal be in this particular, that the poor people, who now destroy all the hedges in the country through which it is intended to pass, will find hedge-breaking a losing trade,

as it is beyond a doubt, that coals at twelve-pence or thirteen-pence a hundred weight, will be cheaper to them than hedge-wood stolen. As to the coasting trade, it is apprehended, that those who make that objection, little consider the great disadvantage which will lie upon the new navigation, as opposed to that by sea. Cheshire cheese, of which much talk hath been made, will now go to London by sea under the rate of a guinea per ton, and that is less by two or three shillings than it will cost if it were carried to Oxford for nothing, and thence sent to London by water. The Liverpool trade hath also been mentioned. Merchandise by sea may be sent from thence at less than twenty shillings per ton; whereas, if it be sent to Oxford first, and afterwards to London, it will, perhaps, nearly treble that sum. But were it otherwise, are not the public advantages, which are sure to arise from this scheme, sufficient to counterbalance the inconvenience of some very few hands being taken from the coasting trade? We will suppose that the place of some few thousands of chaldrons of coals (not ten) may be supplied by means of this canal; will the lessening fifty, or three-score, or even four-score hands in the coasting trade, fill us with such terrors, as to crush a scheme that may preserve thousands from perishing? As to the loss of land, so far as it affects proprietors, it is intended to be paid for. As it affects the public, let us only consider what an immense quantity of horse provender is consumed for the support of that land carriage which this canal is intended to reduce; and what a multitude of acres will be brought into cultivation for wheat and barley, which are now wasted for horses; let us also consider the immense sums of money paid by the public, for the liberty of travelling in the very worst turnpike roads in the kingdom, and which can never be made good so long as the great number of heavy carriages are obliged to pass over them; and then we may very soon reconcile ourselves to the loss of land, which in the mouth of a florid orator may cause dreadful impressions. As to the damage feared by the proprietors over whose lands the canal may happen to pass, sufficient compensation is made for it. But let private gentlemen consider, nay, let the public consider, that by a more equal distribution of the people, (the most certain consequence of inland navigation) the more easy superintention of manure upon the lands in the vicinage of the canal, the reduction of the price of coals, and thereby of all kinds of labour, those lands will not only be raised greatly in their price, but, what is much more to the purpose, greatly in their value. The manufacturers and product of the kingdom, the only real riches we have, will be increased, our poor will be relieved, and our roads once more become passable.

AIR, SOIL, and NATURAL PRODUCTIONS.

The air of Oxfordshire is equal to that of any county in England; for the soil is naturally dry, free from bogs, fens, and stagnant waters, and abounding with quick limpid streams, which necessarily render the air sweet and healthy.

The soil, in many places, is very fertile, both in corn and grass; but as there is in it a great variety, there is also, of consequence, several degrees of fruitfulness. It abounds with meadows, which are not surpassed by any pastures in England. Here is plenty of excellent river fish of various kinds. The other productions of this county are cattle, fruit, free-stone, and several sorts of earths used in medicine and painting, particularly of yellow ocre, which is found plentifully in the pits on Shottover hills, near Oxford. But it is thinly strewed with wood, and consequently fuel is very scarce.

Remarks on the HUSBANDRY of Oxfordshire.

The soil, especially in the eastern parts of the county, near Stokenchurch, is all chalk; but the crops of corn in general clean and good. The land lets in that neighbourhood at about ten shillings an acre. Their course of husbandry, with a few accidental exceptions, is, 1. fallow; 2. wheat; 3. spring-corn; 4. clover, two

years; 5. fallow. Three quarters of wheat, five quarters of barley, and four quarters of oats per acre, are considered as middling crops. The prices of labour are as follow:

All the year, harvest excepted, one shilling a day. In wheat harvest, two shillings, and beer. In barley harvest, one shilling and six-pence, and beer. Reaping wheat, five shillings per acre. Mowing barley, one shilling. Oats, ten-pence. Grass, from one shilling and four-pence to one shilling and six-pence.

They plough with six horses, and turn up an acre in a day, sometimes less.

From Tetford to Oxford, the country is extremely disagreeable, barren, wild, and almost uninhabited; nor is the husbandry by any means perfect here.

In the neighbourhood of Witney, there is a great variety of soils, some of which are doubtless very rich, as they are let at fifty shillings and three pounds per acre, while under tillage, which is indeed only for a year or two, when they are again laid down, when the rent is from twenty to twenty-five shillings the acre. But in the same neighbourhood, many inclosed fields let at twenty shillings, and the common fields from seven to twelve shillings an acre. Their course in husbandry is something remarkable; 1. wheat; 2. beans; 3. barley; 4. fallow; 5. barley; 6. clover; with some variations. They set their beans with a dibble, and keep them clean by hoeing. They use both foot and wheel ploughs, but draw both sorts with four horses. They use manure only for wheat and barley crops, and estimate the produce of their land in proportion to the seed. Wheat they reckon five or six bushels for one; and as they sow three bushels on an acre, the produce is consequently two quarters, or two and a half; barley, three quarters; beans, three and a half. They have no dairies, and feed their hogs in summer with beans; so little are they acquainted with the method of feeding them with clover.

The price of labour is one shilling per day, during the winter and spring; fourteen pence in hay-time; and one shilling and six-pence in harvest. Reaping wheat, five shillings per acre. Mowing soft corn, eight-pence. Beans, one shilling and nine-pence; and grass, one shilling and four-pence. Hoeing beans, three shillings and six-pence, or four shillings each time.

CITY, BOROUGH, MARKET TOWNS, &c.

We entered this county by the Abingdon road, crossing the Thames or Isis over a stone bridge, to the city of Oxford, which is finely situated at the conflux of the Thames and Charwell, fifty-five miles from London.

The city of Oxford is governed by a mayor, a high steward, a recorder, four aldermen, eight assistants, two bailiffs, a town-clerk, two chamberlains, all that have served the office of bailiff and chamberlain, and twenty-four common-councilmen. The mayor, for the time being, officiates at the coronation of our kings, in the buttery, and receives a large gilt bowl and cover for his fee.

The magistracy of Oxford is subject to the chancellor or vice-chancellor of the university, in all affairs of moment, even those relating to the city; and the vice-chancellor administers annually an oath to the magistrates and sheriffs, that they will maintain the privileges of the university. The mayor, and sixty-two of the chief citizens, also pay each one penny every year on the tenth of February, at the church of St. Mary, in lieu of a heavy fine laid on the city in the reign of Edward III. when sixty-two of the students were murdered by the inhabitants.

The city is finely situated on a rising ground, the ascent of which is so gradual, as hardly to be perceived, and in the midst of a most beautiful extent of meadows, to the south, east, and west, and of corn-fields to the north. The vales on the east are watered by the river Charwell, and those on the west and south by the main stream, and several branches of the Isis. Both rivers meet towards the south-east. The landscape is bounded on every side, the north excepted, by a range of hills covered

covered with woods. The opening to the north admits a free current of fresh air, and entirely removes all the inconveniencies which would otherwise arise from the noxious vapours of a watery situation. From some of the surrounding hills, the traveller is surpris'd with an unparalleled prospect of magnificence and plenty; of numerous spires, domes, and turrets, with the combined charms of verdure, water, and trees. The soil is a fine gravel; and on the whole, the situation is not less healthy than agreeable.

The private buildings are neat, and the public ones sumptuous. The streets are spacious, clean, and regular, and well supplied with water by an engine erected on the river Isis.

Here are fourteen parish churches, besides the cathedral, which, belonging to Christ-church college, will be described in its proper place.

The names of these churches are,

- | | |
|--------------------------------|-----------------------------|
| 1. St. Mary's. | 8. St. Mary Magdalen's. |
| 2. All Saints. | 9. St. Peter's in the East. |
| 3. St. Martin's, or Carfax. | 10. Holiwell. |
| 4. St. Aldate's, or St. Old's. | 11. St. Giles's. |
| 5. St. Ebb's. | 12. St. Thomas's. |
| 6. St. Peter's in the Bailey. | 13. St. John's. |
| 7. St. Michael's. | 14. St. Clement's. |

Only four of the churches belonging to these parishes are worthy observation, viz. All Saints, St. Peter's, St. John's, and St. Mary's.

The church of All Saints, situated in the High Street, is an elegant modern structure, much in the stile of many of the new churches in London. It is beautified, both within and without, with Corinthian pilasters, and finished with an attic story and balustrade. There is no pillar in the church, which is seventy-two feet long, forty-two wide, and fifty high. The ceiling, altar, pulpit, &c. are finely executed. The steeple is remarkable, in the modern manner. Its architect was Dr. Aldrich, formerly dean of Christ-church.

The church of St. Peter in the east, standing near the High Street, was partly built by St. Grymbald, eight hundred years ago; and is reported to be the first church of stone that appeared in this part of England. It was formerly the University Church; and even at present, with a view of ascertaining their original claim, the University attend their sermons in it every Sunday in the afternoon during Lent. The tower and east end are curious pieces of antiquity.

St. John's belongs to Merton College, and will therefore be described with that structure.

The church of St. Mary, in which the public sermons of the University are preached on Sundays and holidays, is situated about the middle of the north side of the High Street. It was rebuilt in the reign of Henry VII. as it appears at present. It consists of three isles, with a spacious choir or chancel, which is separated from the nave by an organ, with its gallery, originally made by Father Smith, and since improved by Mr. John Byfield. The pulpit is placed in the centre of the middle isle. At the west end of the same isle is situated the vice-chancellor's throne, at the foot of which are seated the two proctors. The seats which descend on either side, are appointed for the doctors and heads of houses, and those beneath for the young noblemen. The area consists of benches for the masters of arts. On the west end, with a return to the north and south, are galleries for the under-graduates and bachelors of arts. The tower, with its spire, is a noble and beautiful fabric, one hundred and eighty feet in height, and richly ornamented with pinnacles, niches and statues, which, as Plot informs us, were added by King, the first bishop of Oxford, in the reign of Hen. VIII. It contains six remarkably large bells, by which the proper notice is given for scholastic exercises, convocations, and congregations. On the south side is a portal, of more modern structure, erected by Dr. Morgan, chaplain to archbishop Laud, in the year 1637.

In the centre of the city is a curious structure, called Carfax Conduit, erected by Otho Nicholson in the reign of James I.

The town-hall, situated in Fish-street, is a neat and commodious structure, erected partly at the expence of

the late Thomas Rowney, Esq; sometime representative and high steward of this city.

Here is a stone bridge over the Cherwell, called Magdanel bridge, six hundred feet in length, and consisting of twenty arches. In the western suburb is another bridge, called High-bridge, over a branch of the Thames; and near it is another very fine stone bridge now building over the same stream, for the convenience of a new road now making there. Besides these, there is another bridge over the Thames, at the extremity of Fish-street, and called Folly-bridge. It is also of stone, and consists of three principal arches. On the centre of this bridge is an ancient tower, called Friar Bacon's Study, under which is the road to Abingdon.

At a small distance from the city, and facing the road leading to Woodstock and Banbury, is an hospital, elegantly built of hewn stone, upon the plan of the county hospital at Gloucester. This edifice was erected by the trustees of Dr. Radcliffe's benefaction, out of the surplus money remaining after defraying the expence of his library. The ground was given by Thomas Rowney, Esq; above mentioned. The building was begun in May 1759, and prosecuted with remarkable expedition. It is now finished, and calculated to hold seventy patients.

We shall now proceed to describe the public buildings, and afterwards the several colleges and halls which form the celebrated university of Oxford; and begin with what is called the New, or Radclivian Library, from its founder, Dr. John Radcliffe, a physician of great eminence, who left forty thousand pounds to build a library, for the use of the university, with a salary of one hundred and fifty pounds a year to a librarian, and one hundred pounds a year towards furnishing the library with new books. In consequence of this legacy, the first stone of the building was laid on the seventeenth of May, 1737; and the library was opened, with great solemnity, on the thirteenth of April 1745, by the name of the New, or Radcliffivian Library.

This structure is situated in the middle of a magnificent square, formed by St. Mary's church, the public schools, and two colleges, one called Brazen Nose, and the other All Souls. It is a very sumptuous pile of building, erected upon arcades, which, circularly disposed, enclose a spacious dome in the centre. From hence we pass by a well executed flight of spiral steps into the library itself. This room, which is a complete pattern of elegance and majesty, rises into a capacious dome, ornamented with fine compartments of stucco. The pavement is of two colours, and made of a peculiar species of stone brought from Hartz Forest in Germany. The room is enclosed by a circular series of arches, beautified with festoons, and supported by pilasters of the Ionic order. Behind these arches are formed two circular galleries, above and below, where the books are disposed in elegant cabinets. The compartments of the ceiling, in the upper gallery, are finely stuccoed. Over the door, at our entrance, is a statue of the founder, Dr. Radcliffe, by Ryfbrac, which is most advantageously viewed from the point opposite to it, in the last mentioned gallery. Over the entrance of one of the galleries is a good bust of Gibbes, the architect. In a word, the finishing and decorations of this attic edifice are all in the highest taste imaginable.

The schools form a magnificent quadrangle. The principal front on the outside is about one hundred and seventy-five feet in length; in the centre of which is a noble tower, whose highest apartments are appointed for astronomical observations, and other philosophical experiments. The inside of this part must please every lover of ancient grandeur. Three sides of the upper story of the quadrangle are one entire room, called the Picture Gallery, the north side of which is one hundred and twenty-nine feet six inches; the east side one hundred and fifty-eight feet six inches; and the breadth twenty-four feet six inches. This is chiefly furnished with valuable portraits of founders and benefactors, and of other eminent men; as also with cabinets of medals, and cases of books. It was wainscotted by the munificence of Dr. Butler, the late president of Magdalen College, and the late duke of Beaufort.

Thomas Fermor, earl of Pomfret, and his wife, both in one piece, full length, by Bardwell.
 Mr. Addison, by Sir Godfrey Kneller.
 Margaret Ruffel, countess of Cumberland, in king Henry VII.'s time.
 Theodorus Haake.
 Andrews, bishop of Winchester.
 The late earl of Abingdon's father, full length, by Doll.
 Michael Angelo, a famous painter, by Walker.
 Richard Vaughan, bishop of London.
 Dr. Jane, canon of Christ-church.
 Geoffrey Chaucer.
 Dr. Aldrich, dean of Christ-church, by Sir Godfrey Kneller.
 Dr. South, canon of Christ-church.
 Dr. Hough, bishop of Worcester.
 Sir Godfrey Kneller, by himself.
 James Gibbs, architect.
 Dr. Newton, principal of Hertford College.
 Samuel Clarke, a great linguist.
 The earl of Strafford, in king Charles I.'s time, by Vandyke.
 Laurence earl of Rochester, lord Clarendon's son, by Sir Peter Lely.
 Sir John Hawkins, rear-admiral in queen Elizabeth's time.
 Our Saviour making himself known by breaking of bread to his disciples at Emmaus; on copper, by P. P. Rubens.
 James Sherley, a poet.
 A bust of Sir Christopher Wren, by Edward Pierce.
 The Fair Maid of the Inn at Inspruck, copied from Rufalla, by Kirkhall, senior.
 Dr. Stradford.
 Miss Harley. Miss Squire.
 Mr. Dodson, painter.
 The lady Windfor's daughter.
 The present lady Limster, 1722.
 Count Oxenstiern, a Swede.
 Michael, lord of Montaigne.
 Sir Hans Sloane, full length, by Richardson.
 Dr. Dillenius, late professor of botany in the university of Oxford.
 Monsieur Balzac, a French writer.
 Charles XII. king of Sweden, full length, by Schroder.
 The late king of Prussia, full length.
 Dean Swift, by Jarvis.
 Ben Johnson.
 Sheffield, duke of Buckingham, full length, by Richardson.
 Alexander Pope, by Jarvis.
 John Dryden.
 William Bromley, Esq; speaker of the House of Commons in queen Anne's time, by Doll.
 Dr. Ratcliffe, a great benefactor to the University, by Doll.
 Thomas Willis, M. D.
 John Speed, the historian.
 John Fox, author of the book of Martyrs.
 Hugo Grotius.
 Sir Thomas Wyatt, in queen Mary's time.
 Sir Henry Saville, founder of the astronomy, and geometry professorships; provost of Eaton, and warden of Merton College, in queen Elizabeth's time, full length.
 Sir Francis Drake.
 Abraham Cowley, when he was old, by Sir Godfrey Kneller.
 Nicholas Harpsfield, archdeacon of Canterbury, in queen Mary's time.
 Archbishop Sheldon, founder of the theatre.
 Lord Clarendon, author of the History of the Rebellion.
 Archbishop Laud, chancellor of the University.
 James, duke of Ormond, by Ryley.
 Sir Kenelm Digby, by Vandyke.
 Robert Dudley, earl of Leicester, in queen Elizabeth's time.
 A fine head of our Saviour.

A fine head of king Charles I.
 Mr. Selden, a great benefactor to the Bodleian library.
 The earl of Kildare, in Henry VIII.'s time.
 The earl of Pembroke, chancellor of the University, in king James I.'s time, full length.
 Cardinal Wolsey, an original.
 Archbishop Cranmer.
 Thomas Egerton, chancellor of England, and of the University.
 Sir Thomas Sackville, earl of Dorset, and chancellor of the University.
 Hieronymus Weston, earl of Portland, in king Charles I.'s time.
 Lady Betty Paulett, an ingenious lady of the duke of Bolton's family, in king James I.'s time, drawn in a dress of her own work, full length.
 Burleigh, treasurer in queen Elizabeth's time.
 Charles earl of Arran, late chancellor of the University, full length, by Sir James Thornhill.
 James duke of Ormond, chancellor of the University, in queen Anne's time, full length, by Sir Godfrey Kneller.

Under the Picture Gallery are the schools of the several sciences, in one of which are placed the Arundelian marbles; and in another, that inestimable collection of statues, &c. lately presented to the University by the countess of Pomfret; a complete catalogue of which we have here subjoined, as they stand respectively numbered in their present repository.

- 1 A statue of a Grecian lady, 7 feet high, wants arms.
- 2 A ditto of Archimedes, 7 feet 2 inches high, wants an arm.
- 3 A ditto of a Roman emperor, 7 feet high, wants one arm and the nose. Perhaps modern.
- 4 A ditto of Minerva, 9 feet high.
- 5 A ditto of a Roman emperor, 7 feet high, wants one arm. Perhaps modern.
- 6 A ditto of Cicero in the proper habit, 6 feet 9 inches high.—The drapery very masterly. He has the Sударium in the right, and a scroll in the left hand. The character of the countenance, Settled Indignation, in which he seems preparing to speak.
- 7 A ditto of a Grecian lady, 7 feet high, wants arms. The drapery falling over the right leg is finely conducted.
- 8 A column from the temple of Apollo at Delphos, with the capital and base; and an Apollo placed at the top, 24 feet 6 inches high.
- 9 A statue of Sabina, 6 feet 9 inches high.
- 10 A Venus de Medicis.
- 11 A square Roman altar, 1 foot 6 inches, by 1 foot 3.
- 12 Terminus of Pan, 5 feet 7 inches high, wants an arm.
- 13 A statue of Minerva, 5 feet high, wants an arm and the nose.
- 14 A circular Roman altar, 2 feet 4 inches high.
- 15 A statue of a woman, 6 feet high, wants arms, and part of the nose.
- 16 A Venus clothed.
- 17 A circular Roman altar, 2 feet 6 inches high.
- 18 A statue of Clio sitting, 4 feet 6 inches high, wants one arm and hand.
- 19 A circular Roman altar, 2 feet 4 inches high.
- 20 A statue of a young Dacian, 4 feet 3 inches high—Perhaps Paris. It is of great antiquity.
- 21 A Roman altar, 2 feet 4 inches high.
- 22 A statue of Antinous, 5 feet 6 inches high, wants a finger of the right hand.
- 23 A Grecian lady, 4 feet 8 inches high, wants an arm.
- 24 A statue of Jupiter and Leda, 3 feet 10 inches high, wants arms.
- 25 An antique capital, 1 foot 6 inches, by 2 feet, wants a corner.
- 26 A circular pedestal finely ornamented with heads and festoons of fruit, 3 feet, by 1 foot 3 inches diameter.
- 27 A statue of Scipio Africanus, or Demosthenes, 7 feet high.—The drapery in a very bold style. It is probably of some orator; the right hand being laid on the breast, in a persuasive posture.
- 28 A ditto of a woman clothed, 3 feet 8 inches, wants a head.

- 29 A trunk of a woman, 2 feet 1 inch high.
 30 A boy with his finger in his mouth, 2 feet 5 inches high.
 31 A statue of Jupiter sitting, 3 feet high, wants a hand.
 32 A ditto of a woman, 3 feet 4 inches high.
 33 The trunk of a woman, 2 feet 1 inch high.
 34 Germanicus's tomb, 7 feet by 1 foot 8.
 35 Two capitals with beasts heads, 2 feet 3 inches high.
 36 An Ægyptian chair, 2 feet 5, by 1 foot 8.—Belonging to a priest of Isis and Osiris.
 37 A stone carved with a claw at the end, 2 feet 7 by 2 feet 6.
 38 A statue of a Roman consul, 7 feet high, wants a hand and fingers of the other.
 39 A ditto of a woman, 4 feet high, wants the head.
 40 A ditto of Flora, 3 feet 10 inches.
 41 A ditto of Hercules, 4 feet high, wants hands.
 42 A ditto of Diana, 4 feet 8 inches high, wants arms.
 43 A ditto of Cupid sleeping, 5 feet 6 inches high.—The Lizard may be a device for the name of the sculptor, unless allegorical.
 44 A ditto of Venus half naked, 4 feet high.
 45 A circular altar, 2 feet 6 inches high.
 46 A statue of Melpomene sitting, 4 feet high.—Perhaps it is Agrippina, in the character of Melpomene.
 47 A circular Roman altar, 2 feet 10 inches high.
 48 A Grecian lady, 4 feet 8 inches high, wants arms.
 49 A circular Roman altar, 2 feet 8 inches high.
 50 A statue of Camilla, 6 feet 5 inches high.
 51 A ditto of a Grecian philosopher, 5 feet high, wants the right arm.
 52 A circular Roman altar, 2 feet 2 inches high.
 53 A statue of Caius Marius, 6 feet high.—It has a noble severity.
 54 A statue of Bacchus naked, 4 feet 2 inches high.—A delicate piece of sculpture. The hand is added with much address by Guelphi, from whom are all the modern additions.
 55 A circular Roman altar, 2 feet 2 inches high.
 56 A statue of Julia, 6 feet 9 inches high, wants the arms.
 57 A Roman fathom, 6 feet 10 inches by 2 feet.
 58 A Sphynx, 5 feet 8 inches long.
 59 A ditto somewhat less.
 60 A sacrifice, 2 feet 3 by 2 feet.
 61 A basso relievo of a Dacian's sacrifice, 2 feet, by 2 feet 4.
 62 Part of a sacrifice, 1 foot 8 inches by 1 foot 2.
 63 A naked trunk of an hermaphrodite.
 64 Basso relievo, 1 foot 10 inches by 1 foot 3.
 65 Basso relievo of a shepherd, 2 feet by 11 inches.
 66 A Bacchanalian, 2 feet 3 inches by 2 feet.
 67 A woman's head, 1 foot 6 inches high, wants a nose.
 68 The trunk of a man, 2 feet 2 inches.
 69 A trunk of a woman sitting, 2 feet 7 inches.
 70 A consular trunk, 5 feet 6 inches high.
 71 A trunk of a woman sitting, 2 feet 7 inches.
 72 A bust of a Roman, 1 foot 6 inches high, wants a nose.
 73 The head of a man, 1 foot high, wants a nose.
 74 A trunk of Venus naked, 1 foot 10 inches high.
 75 An old man's head.
 76 A man's head, 10 inches high, wants the nose.
 77 Part of a head and neck, 1 foot 6 inches high.
 78 An old man's head.
 79 A statue of a young satyr, 2 feet 6 inches high.
 80 A naked trunk of a man, 2 feet 6 inches high.
 81 Beasts devouring men.—It is the pedestal of a table. Scylla and Charybdis are represented devouring mariners, whose attitudes are extremely fine.
 82 A trunk of a woman, 2 feet 8 inches high.
 83 Part of a man's foot.
 84 A naked trunk of a man, 2 feet 6 inches high.
 85 Part of two masks, 2 feet 5 inches by 1 foot 9.
 86 A lion, 3 feet 10 inches long.
 87 An alabaster urn, 2 feet 8 inches high.
 88 A sarcophagus, 5 feet 2 inches by 1 foot 6.
 89 A statue of Judith, 4 feet 6 inches high.
 90 A ditto of Hercules choaking a lion.—Few figures have greater spirit. On the rock adjoining seems

- to have been the figure of a woman, perhaps of a Muse fingering the achievement to her harp.
 91 A sarcophagus with boys, 4 feet by 1 foot 4.
 92 A sea-lion, 3 feet 6 inches long, 2 feet 4 inches high.
 93 Dogs and a boar, 2 feet long.
 94 A sleeping Cupid, 2 feet 5 inches.
 95 A sarcophagus, 2 feet 3 inches by 1 foot.
 96 A basso relievo Roman repast, 2 feet by 1 foot 7.
 97 A trunk of a woman, 2 feet high.
 98 Soldiers fighting, 1 foot 11 inches by 2 feet 3.
 99 Soldiers fighting, 3 feet 11 by 1 foot 3.
 100 A trunk of a young man, 1 foot 11.
 101 The triumph of Amphytrion, 2 feet by 2 feet.
 102 A trunk of a woman sitting, 1 foot 3 inches high.
 103 The taking of Troy, 7 feet by 11 inches.—The figures executed with amazing expression.
 104 Boys embracing, 2 feet 3 inches by 1 foot 6.
 105 The Herculean games, 2 feet 3 inches by 2 feet.
 106 Boys, 2 feet by 1 foot.
 107 A woman and a child sitting in a square nich, 1 foot 9 inches by 1 foot 7.
 108 A Roman monument with three busts, 3 feet 10 inches by 2 feet 3.
 109 Part of a Roman monument.
 110 Ditto.
 111 Bust of a Roman head.
 112 Ditto.
 113 A Roman bust.
 114 A bust of Fauna.
 115 A ditto of Fauns.
 116 The bust of a young man.
 117 A ditto of Diana.
 118 Ditto of a Grecian.
 119 Ditto of a woman clothed.
 120 Ditto of a philosopher.
 121 Philosophy, a bust.
 122 A bust of Niobe.
 123 Ditto of one of her sons.
 124 Ditto of Venus de Medicis.
 125 Ditto of a woman clothed.
 126 A bust clothed, wants the head.
 127 Ditto.
 128 Ditto.
 129 Ditto.
 130 A bust naked, head wanting.
 131 Bust of an old man, half naked.
 132 Ditto of a Roman.
 133 Bust of Henry VIII. Modern.
 134 Ditto (modern) of Rob. C. Pal. Rhen. D. Bav. 1637, Ætat. 17.
 135 A colossal head of Apollo.
 The first stone of the schools was laid March 30th, 1613; and the building was carried on at the combined expence of many benefactors.

The Bodleian or Public Library is a part or member of the last-mentioned edifice. It consists of three spacious and lofty rooms, disposed in the form of the Roman H. The middle room was erected by Humphrey, duke of Gloucester, over the Divinity-school, about the year 1440, and by him furnished with books, all which have been since lost. The gallery on the west side was raised at the expence of the University, under the chancellorship of archbishop Laud, together with the Convocation House beneath. The vestibule, or first gallery, with the proscholium under it, was built by Sir Thomas Bodley, who furnished the whole with a collection made with prodigious care and expence. He likewise assigned an estate for the maintenance of a librarian, &c. and the support of a public fund for the library, adding a body of statutes, for the regulation of his new institution. By these services he justly deserved the name of the Founder of the Library. He died on the twenty-eighth of January, 1612.

The original stock has been greatly enriched by the accession of many valuable collections of manuscripts, particularly Greek and Oriental; besides large additions of choice and useful books, from various donations. The principal benefactors have been the earl of Pembroke, archbishop Laud, Sir Thomas Roe, Sir Kenelm Digby,

Digby, general Fairfax, Dr. Marshal, Dr. Barlow, Dr. Rawlinson, Mr. St. Amand, &c. The library is now in a very flourishing condition, which it is likely to preserve and improve, under the management of the present vigilant and learned librarian.

It may be proper to take notice here, that the Bodleian Library, and Picture Gallery, can only be seen from eight to eleven in the morning; and in the afternoon, between one and four, from Michaelmas to Ladyday; and between two and five from Ladyday to Michaelmas.

In this library are the following pictures:

Sir Thomas Bodley, the founder of the library.

The head librarians of the Bodleian Library—Dr. James, Dr. Rouse, Dr. Barlow bishop of Lincoln, Dr. Lockey, canon of Christ-church, Dr. Hyde, Dr. Hudson, and Mr. Bowles.

St. Jerom.

Marcus Tullius Cicero.

Lord Crew, bishop of Durham.

Sir Kenelm Digby.

Bishop Andrews.

Hugo Grotius.

Joseph Scaliger.

Galileo, a famous astronomer.

Father Paul.

Sir Thomas More, chancellor of England, done by his niece, Maria More.

Erasmus, by Hans Holbein.

Bochart.

Mr. Selden, benefactor to the Bodleian Library, done by Sir Peter Lely.

Dr. Pocock, canon of Christ-church.

Archbishop Usher.

Dr. Hicks.

Humphrey Wanley, librarian to the old earl of Oxford, by Hill.

King James I.

King Charles I. and his queen.

Henry prince of Wales, king Charles I.'s elder brother.

Princess Elizabeth, palatine queen of Bohemia, sister to king Charles I.

King Charles II. when a boy.

Lord Falkland, who was killed in the civil wars.

Margaret countess of Richmond, mother to Henry VII.

Lady Jane Grey.

A fine bust of Sir Thomas Bodly, the founder of the library.

A fine bust of king Charles I.

On the Stair-case.

Sir Martin Frobisher, a famous admiral in queen Elizabeth's time.

Isaac Casaubon.

Dr. Coney, M. D.

A south prospect of Oxford, by Summers.

Our Saviour and the woman of Samaria.

Scaliger.

James Zarabella.

Mr. Taylor, a poet.

Charity.

Hope.

Piety.

Having visited the Library, we should not neglect the Divinity School, which stands under the same roof. It was begun at the expence of the University, A. D. 1427, and afterwards completed, with its superstructure, by duke Humphrey. Its ceiling is a most finished piece of Gothic masonry, both in design and execution; and on the whole, it is probably the most complete Gothic room in this kingdom. At the end of it is the Convocation House, which is a spacious room, commodiously furnished, and handsomely decorated. It was built, with its superstructure, A. D. 1639.

Opposite to the Divinity School stands the front of the Theatre, adorned with Corinthian pillars, and two statues of archbishop Sheldon and the duke of Ormond, with other decorations. At our entrance the mind is

strongly and suddenly struck with ideas of majesty and beauty. But this room exhibits the most august appearance, when properly filled. It is equally disposed to contain, and shew to advantage, a large and solemn assembly. The vice-chancellor, with the two proctors, are seated in the centre of the semicircular part; on each hand are the young noblemen and doctors; the masters of arts in the area: the rest of the University, and strangers of both sexes, are placed in the galleries. The roof is flat, and not being supported either by columns or arch-work, rests on the side-walls, which are at the distance of eighty feet one way, and seventy the other. This roof is covered with allegorical painting, of which the following explication is here inserted, from Dr. Plot's Natural History of Oxfordshire.

' In imitation of the theatres of the ancient Greeks and Romans, which were too large to be covered with lead or tile, so this, by the painting of the flat roof within, is represented open; and as they stretched a cordage from pilaster to pilaster, upon which they strained a covering of cloth, to protect the people from the injuries of the weather, so here is a cord-moulding gilded, that reaches cross and cross the house, both in length and breadth, which supporteth a great reddish drapery, supposed to have covered the roof, but now furled up by the Genii round about the house, towards the wall, which discovereth the open air, and maketh way for the descent of the Arts and Sciences, that are congregated in a circle of clouds, to whose assembly Truth descends, as being solicited and implored by them all.

' For joy of this festival some other Genii sport about the clouds, with their festoons of flowers and laurels, and prepare their garlands of laurels and roses, viz. Honour and Pleasure, for the great lovers and students of those arts: and that this assembly might be perfectly happy, their great enemies and disturbers, Envy, Rapine, and Brutality, are by the Genii of their opposite virtues, viz. Prudence, Fortitude, and Eloquence, driven from the society, and thrown headlong from the clouds. The report of the assembly of the one, and the expulsion of the other, being proclaimed through the open and serene air, by some other of the Genii, who blowing their antic trumpets, divide themselves into the several quarters of the world.—*Hitherto in gross.*

More particularly, the circle of figures consists,

' First, of Theology, with her book of seven seals imploring the assistance of Truth for the unfolding of it.

' On her left hand is the Mosaical Law veiled, with the table of stone, to which she points with her iron rod.

' On her right hand is the Gospel, with the cross in one hand, and a chalice in the other.

' In the same division, over the Mosaical Law, is History, holding up her pen, as dedicating it to Truth, and an attending Genius, with several fragments of old writings, from which she collects her history into her book.

' On the other side, near the Gospel, is Divine Poesy, with her harp of David's fashion.

' In the triangle on the right hand of the Gospel, is also Logic, in a posture of arguing; and on the left hand of the Mosaical Law is Music, with her antic lyre, having a pen in her hand, and a paper of music notes on her knee, with a Genius on her right hand, (a little within the partition of Theology) playing on a flute, being the emblem of ancient music.

' On the left (but within the partition for Physic) Dramatic Poesy, with a vizard, representing Comedy, a bloody dagger for Tragedy, and the reed pipe for Pastoral.

' In the square on the right side of the circle, is Law, with her ruling sceptre, accompanied with records, patents, and evidences, on the one side, and on the other with Rhetoric. By these is an attending Genius, with the scales of Justice, and a figure with a palm-branch, the emblem of reward for virtuous actions; and the Roman Fasces, the marks of power and punishment.

Painting, with a case of letters in one hand, and a form ready set in the other, and by her several sheets hanging as a drying.

On the left side the circle, opposite to Theology, in three squares, are the Mathematical Sciences, (depending on Demonstration, as the other on Faith) in the first of which is Astronomy with the celestial globe, Geography with the terrestrial, together with three attending Genii, having Arithmetic in the square on one hand, with a paper of figures; Optics with the perspective glass; Geometry with a pair of compasses in her left; and a table with geometrical figures in it, in her right hand. And in the square on the other hand, Architecture embracing the capital of a column, with compasses, and the Norma or square lying by her, and a workman holding another square in one hand, and a plumb-line in the other.

In the midst of these squares and triangles (as descending from above) is the figure of Truth sitting as on a cloud, in one hand holding a palm-branch (the emblem of Victory) in the other the sun, whose brightness enlightens the whole circle of figures, and is so bright, that it seems to hide the face of herself to the spectators below.

Over the entrance of the front of the Theatre, are three figures tumbling down; first, Envy, with her snaky hairs, squint eyes, hag's breast, pale venomous complexion, strong, but ugly limbs, and riveled skin, frighted from above by the sight of the shield of Pallas, with the Gorgon's head in it, against which she opposes her snaky tresses, but her fall is so precipitous, that she has no command of her arms.

Then Rapine, with her fiery eyes, grinning teeth, sharp twangs, her hands imbrued in blood, holding a bloody dagger in one hand, in the other a burning flambeau; with these instruments threatening the destruction of Learning, and all its habitations, but is prevented by an Herculean Genius, or Power.

Next that is represented brutish, scoffing Ignorance, endeavouring to vilify and contemn what she understands not, which is charmed by a Mercurial Genius with his Caduceus.

The allegorical pictures on the ceiling, above explained, were done by Streater, serjeant painter to king Charles II. but the colours, as well as the canvas, having been greatly injured by time, the work was cleaned and repaired in 1762, by Mr. Kettle, an ingenious portrait painter of London; at which time the whole inside was also decorated with new gilding, painting, and other ornaments, at the expence of one thousand pounds; so that this is now universally allowed to be the most superb and splendid room in Europe.

Besides the ceiling, the room is furnished with three admirable full-length portraits of archbishop Sheldon, the duke of Ormond, above-mentioned, and Sir Christopher Wren. Nor should we forget to mention a good statue of Charles II. on the outside of the circular part; the edifice being somewhat in the form of a Roman D.

This beautiful structure was erected from the design of Sir Christopher Wren, A. D. 1669, at the expence of archbishop Sheldon, then chancellor; who having bestowed fifteen thousand pounds in building it, endowed it with two thousand pounds, to purchase lands for its perpetual repair.

In the Theatre are celebrated the public acts; and the annual commemoration of benefactors to the University on the second of July, instituted by the late lord Crew, bishop of Durham, with some other solemnities.

Westward of the Theatre stands the Ashmolean Museum, so called from its founder, Elias Ashmole, Esq; Windsor herald in the reign of Charles II. This munificent patron of learning, in the year 1677, made an offer to bestow upon the University all the rarities he had purchased from the two Tradescants, successively physic-gardeners at Lambeth; together with his own collection of coins, MSS, &c. on condition that they should build a fabric for their reception. The building was accordingly erected, and finished in the year 1682, under the conduct of Sir Christopher Wren. It is inferior to no modern edifice in point of symmetry and

elegance. Its front towards the street is about sixty feet in length. The eastern portico is remarkably well finished in the Corinthian order, and adorned with variety of characteristical embellishments. This piece of architecture is deservedly reckoned equal to any in the University; though, like many others, it is so much crowded by the neighbouring buildings, that the spectator cannot command a proper view of it.

In pursuance of his promise, Ashmole presented to the University a large and valuable collection of natural bodies, together with his coins and manuscripts; he also bequeathed at his death three gold chains, one of philigrain work, consisting of sixty links, weighing twenty-two ounces, with a medal of the duke of Brandenburg; the other a collar of S's, with a medal of the king of Denmark; and the third a chain of equal weight and value, with a medal of the emperor Joseph; all which he had received as honorary presents on occasion of his book concerning the order of the garter.

The Museum has been greatly enriched since its first foundation, by several ample and valuable benefactions. The chief natural curiosities are, a large collection of bodies, horns, bones, &c. of animals, preserved dry, or in spirits; numerous specimens of minerals and metals; shells, especially those of Dr. Martin Lister, together with his ores, fossils, &c. many of which are described in the Philosophical Transactions, or in the pieces published by that ingenious naturalist.

It contains also a small, but well chosen collection of exotic plants, sent from the East Indies by James Pound, M. B. But it has been chiefly indebted to the care and munificence of its two first keepers, Dr. Robert Plott, and Mr. Edward Lhwyd; the former of which gave all the natural bodies mentioned in his histories of the counties of Stafford and Oxon, and the latter the large collections he had made in his travels through the greatest part of England, Wales, and Ireland. A catalogue of many of these was published by himself, elegantly adorned with copper-plates, in the year 1699, under the title of Lithophylacii Britannici Ichnographia. To these valuable treasures a great addition has lately been made by the Rev. William Borlase, who presented to the University all the specimens of crystals, mundicks, coppers, tins, &c. described in his Natural History of Cornwall; which present he also accompanied with his manuscript copy of the history, and the original drawings.

Amongst the curiosities of nature must be reckoned the large magnet given to the Museum by the Right Hon. the countess of Westmoreland, the lady of our late chancellor. It is of an oval shape, its longer diameter eighteen inches, its shorter twelve, and supports a weight of one hundred and forty-five pounds. It is enclosed in an elegant case of mahogany, made at his lordship's expence, and may justly be deemed one of the greatest ornaments, as well as rarities of this place.

Nor is this repository deficient in a good collection of antiquities; such as urns, statues, sacrificial vessels and utensils; it being possessed of most of those described in the Britannia, by bishop Gibson, p. 695, 1022. Here are also many Grecian, Roman, and Saxon coins, the gift of the founder, and Thomas Brathwaite, Esq.

Amongst the works of art, a model of a ship given by Dr. Clark, and a picture representing our Saviour going to his crucifixion, made of feathers, deserve particular notice; also a very ancient piece of St. Cuthbert, made by order of king Alfred, and worn, as is supposed, by that monarch.—This structure is also decorated with the following paintings:

James VI. of Scotland, when a youth.
Lady Molineux.
Richard Napier, M. D.
Ben Johnson.
John Dee.
William Lilly.
Edward lord Wotton of Marley.
Thomas Parr.
Oliver Cromwell.
Charles I.
Inigo Jones.
Cardinal Richlieu.

Cromwell, earl of Essex.
 Elizabeth Woodville, queen of Edward IV.
 Thomas, duke of Norfolk, by Vandyke.
 Thomas, earl of Arundel, by ditto.
 Sir John Suckling.
 Le Neve, a painter.
 Oliver de Cratys, a painter.
 Michael Burck, a poor knight of Windfor.
 Earl of Manchester, chancellor of Cambridge.
 Lewis XI. of France.
 St. Jerom.
 John, king of France, made a prisoner at the battle of Poictiers.
 Dobson the painter's wife, by Dobson.
 Edward V.
 Henry duke of Gloucester.
 John Selden, Esq;
 John Lewen, a celebrated comedian.
 Charles I. when young.
 Mary Davis, a woman who had horns growing on the hinder part of her head.
 Hadrian Beverland, in miniature.
 Charles I. in miniature.
 Sir John Tradescant, junior.
 His first wife, son and daughter.
 His second wife and son.
 Sir John Tradescant, senior, in old age.
 Another, drawn after his death.
 Sir John Tradescant, junior, with his friend Zithepsa, a quaker of Lambeth.
 The same, with his wife
 Robert Plot, LL D. the first keeper of the Museum.
 Elias Ashmole, Esq; founder of the Museum.
 A dead Christ, by Hannibal Caracci.
 Charles II.
 James II.
 A drawing of John Aubrey, Esq; by Faithorne.
 A representation of the battle of Pavie, 1525.
 An emblematical painting of the destruction of the arts, &c. by the Goths.
 The descent of Christ into hell, by Brughell.
 A figure of a gamester.
 A figure of a drunkard.
 A figure of an idiot.
 A Spanish Boor.
 A Laplander.

Besides the room in which the curiosities are deposited, there are three small libraries; the first called by the name of Ashmole's Study, containing his printed books and MSS. chiefly relating to matters of heraldry and antiquity; in which also are the MSS. of Sir William Dugdale, author of the *Monasticon*, &c. The second is that of Dr. Lister, consisting of printed books in physic, and the best editions of the classics, in which also are preserved the copper-plates belonging to the *History of Shells*, published by that author. The last is that of Anthony Wood, containing the valuable manuscript collections of that learned and laborious antiquarian.

In the room on the first floor, lectures are read in experimental philosophy. Underneath is an elaboratory for courses of chemistry and anatomy.

The care and direction of the Museum is vested in six visitors, viz. the vice-chancellor, the dean of Christchurch, the principal of Brazen Nose, the king's professor of physic, and the two proctors for the time being. These have the nomination of the head keeper, and meet annually on Trinity Monday, to inspect the state of the collection, and to pass the accounts. Ashmole designed to have endowed his foundation with ample revenues, and has in his statutes expressed the sums appointed for this purpose, namely, fifty pounds *per annum* for the head keeper, fifteen pounds to the librarian, and five pounds for an assistant; but this generous intention was never put into execution; so that the profits at present arise only from the gratuities given by strangers for the exhibition of the curiosities, which fall greatly short of the original design.

The Clarendon Printing-house is almost contiguous to the Theatre. It is a magnificent structure, consisting of two stories, and is one hundred and fifteen feet in length. The street front has a noble Doric portico, whose columns equal the height of the first story. The back front is adorned with three quarter columns of the same dimensions, and a statue of the earl of Clarendon. Over the top of the building are statues of the Nine Muses. As we enter from the schools, on the right hand, are two rooms where bibles and books of common prayer are printed. Over these are large and elegant apartments, containing several excellent pictures, with a kitchen, and other domestic accommodations, under the whole; all which are rented of the University by Mess. Wright and Gill, of London. The left side consists of rooms for the University press, together with one well-executed apartment, adorned with an excellent portrait of queen Anne, by Kneller; appointed for the meetings of the heads of houses, and delegates.

This edifice was built, A. D. 1711, by the profits arising from the sale of lord Clarendon's *History of the Rebellion*, the copy of which had been presented to the University by his sons, the lords Clarendon and Rochester.
